Mr. DISRAELI'S reference to the possible appropriation of a part of the surplus to "claimants of a much more powerful " character than our own comparatively miserable interest" may serve to relieve the financial anxieties of the Government of India. It ought to be clearly understood that private subscriptions either in London or in Calcutta will go to the relief of the Indian Exchequer, not to the relief of the actual sufferers. There is no reason why benevolent persons should not spend their money in this way; indeed a Government which is vigorously doing its duty under heavy pecuniary burders is a much more deserving object of charity than many of those who usually receive it. But it must not be supposed either in India or in England that the provision of relief is in any sense dependent on private contributions. The Government of India has been authorized to spend all the money that may be necessary to keep the people of Bengal from starving. In so far as this duty can be performed without subjecting the QUEEN'S Indian subjects to an amount of taxation which implies the infliction of real suffering, it is by India that the cost ought to be borne. The VICEROY must be prepared, we fear, to give up all thoughts of a surplus. But supposing that the ordinary revenues of India prove inadequate to this new domand, it is the Imperial Exchequer that must honour it. The precise proportions in which the cost of the famine is to be distributed between the two countries is a matter for the consideration of the Home Government. The main thing to be kept in mind in that there about the parabolishment. mind is that there shall be no hesitation or misunder-standing about spending money. Whatever is really needed to save lives should be done without delay and with-out stint, and it ought to be made abundantly clear to the population of the distressed districts that the contributions offered by private persons are only to be regarded as expressions of sympathy and good will, and that the supply of food in no way depends on these agencies, but will go on in amounts regulated not by the uncertain impulses of individual charity, but by the regular and certain needs of the sufferers.

There is a disposition in some quarters to assume that the transport system to the distressed districts has altogether broken down, and that this fact is equivalent to a demonstration that the Government have been wrong in allowing exportation to go on from Calcutta. There is no connexion, however, between the two ideas. Those who insist on identifying them seem to assume that in the districts suffering from famine there has been at one and the same time a superabundance and a deficiency of grain. But the rice which leaves Calcutta has not been brought thither from the precise localities to which it is necessary that other rice should be carried. It has come thither from districts in which the crops have not failed, and if it had been bought by the Government on the very spot on which it was gathered, it would equally have had to be carried to the distressed districts. Exportation affects, if it affects anything, the amount of rice at the disposal of the Government, and so long as that is adequate to the demand, the consumer is in no way injured. If it should turn out that the Government have not bought enough rice, no amount of censure will be too great for their deserts. But even in that case they will be to blame, not for canitting to prohibit exportation, but for omitting to make sufficiently large purchases. Prohibition of exportation would have made no difference in the difficulty of transport.

Even the fact that the transport system has broken down must be accepted with considerable qualifications. Probably it would be more accurate to say that it has not been found possible to overcome all the difficulties against which it has all along been foreseen that it would have to struggle. No foresight or calculation can be sure of overcoming natural obstacles. There is one point, however, as regards the Government purchases on which it would be well to have further explanation. The Vicerov has apparently thought it better to import Burmese rice rather than buy the native rice which passed through Calcutta to the Mauritius and elsewhere; and it is to be supposed that this has been done because the Burmese rice is the cheaper. Certainly a Government is not bound to supply its starving subjects with the precise sort of food they like best. It is enough if it gives them a kind of food which they can eat without injury to health. It is alleged, however, that the Burmese rice does not answer even to this latter requirement, inasmuch as, in persons not accustomed to live on it it tends to produce discase. This is a matter on which Lord Northbrook could scarcely have been left without the advice of experts, and if, as is probable, the statement is either greatly exaggerated or altogether nutrue, it cannot be too soon contradicted. Upon all points, indeed, connected with the famine, the India Office would do well to consider whether any harm could come of greater com-municativeness. We are quite alive to the hindranees which the existence of the telegraph puts in the way of frankness; but these hindrances apply to the details of measures about to be taken rather than to explanations of policy. No harm could have been done, for example, by stating in full the reasons against the prohibition of exportation, or the rules for the application of the labour test, or the reasons for buying Burmese rice, or the machinery for conveying supplies to remote districts. Yet, if the policy of the Indian Government on all these heads had been explained and defended, much unjust criticism, and sensational description might which the existence of the telegraph puts in the way of much unjust criticism and seem expanded and description might have been anticipated. Secresy has many advantages when it can be really maintained. But secresy which extends only to the Government and cannot be imposed on persons outside the Government usually does more harm than good. The Bengal famine is becoming a matter of such popular interest that a certain part of newspaper space is sure to be devoted to it. In that space the narratives of actual witnesses or responsible politicians should at all events be found side by side with the conjectures or predictions of irresponsible correspondents.

THE ASHANTEE WAR.

IF Mr. GLADSTONE had not been in a hurry, he would have met Parliament on Thursday, the 5th of February, with the news which arrived on that day of the successful termination of the Ashantee war. It is a well-known and intelligible fact that good luck of any kind confers a certain amount of popularity on the Government of the day; and the Ministers have had much more than a casual share in the accomplishment of the Ashantee campaign. Mr. CARDWELL may in the first instance claim the merit of having selected one of the most competent officers in the army as Commander-in-Chief; and he has since, with prudent liberality, spared no care or expense in providing the material conditions of victory. As might have been expected, the Misser of War and his advisers have made one or two mistakes, such as the preparation of a railway which was afterwards abandoned as useless or impracticable; but an error of superfluity is far less mischiovous than unreasonable parsimony in the supply of stores or of munitions of war. Military administra. tion, in common with other usoful arts, has made great advance on the practice of former times. The negligence and indifference of English Governments in the great French war have now become almost incredible. The Duke of Your was employed to command the English army in the Netherlands against the best generals of the Republic; and some years afterwards Lord CHATHAM, notwithstanding his notorious indolence and incapacity, was allowed to incur the inovitable disaster of Walcheren. A Minister who in the present day should address to a general on active service such a letter as Mr. Perceyal, wrote in 1816 to Lord Wellswerter would be driven from affice by universal indignation. It is not known whether the Garrier Wolseley has been fully exhibited with the

A NOTE

measures which have been adopted by the War Office his aid and support; but it may be safely susumed that, with the exception of Lord Nature in the Abyssinian expedition, no English General has been more amply provided than Sir Garser Wolselev with all things necessary to successful the second to vided than Sir Garrer Wolseller with all things recessary to success. It was more economical as well as safer to exceed the expense which would have been strictly necessary than to etint the military and sanitary argingements. If the Ashantees had not been reduced to the transfer during the comparatively cool season, it might perhaps have been necessary to renew the enterprise on a larger scale in the course of next winter.

If Mr. DISBAELI had foreseen a fortnight ago the triumph which he has obtained for reasons wholly unconnected with West African affairs, he would probably not have included

West African affairs, he would probably not have indulged in unfounded attacks on the Government for its conduct in the Ashantee war. No charge could be more idle than the complaint that a war had been undertaken without the assent of Parliament. If a quarrel with France, with Germany, or with Russia were unfortunately to occur, it would be highly proper to consult Parliament in a crisis which would involve the gravest political and financial issues; but the Ministers who are responsible for the safety and honour of a vast Empire are not bound to wait for specific instructions whether they shall repel a barbarous assailant of an outlying possession. There might have been a pretext for summoning Parliament in the autumn if it had been necessary to provide by new taxes or loans for the expense of the campaign; but as the whole cost will be met by the surplus revenue of the current year, it was wholly unnecessary to obtain the authority of the House of Commons for the simple operation of drawing a check. The Ministers were entitled to assume that Parliament would neither submit tamely to Ashantee aggression nor grudge the outlay which might be necessary for the equipment of a warlike force, and for the provision of adequate supplies. The plan of the campaign in no way belonged to Parliamentary cognizance; and the House of Commons would have assuredly declined, even if an opportunity had been offered, to interfere in military appropriate. offered, to interfere in military arrangements. Any uttacks on the Government founded on the Dutch Treaty of 1872 would have been irrelevant and unprofitable. Even if the transfer of the Dutch possessions had anything to do with the Ashantce invasion, Parliament had by assent or by passive acquiescence taken upon itself the responsibility of an arrangement which had never been consured nor even questioned. It was at least evident that it was unnecessary to anticipate the ordinary time of the Parliamentary Session for the more purpose of inviting retrospective criticism. Even if the policy of the Dutch Treaty deserved condemna-tion, it was still indispensable to punish the Ashanteo invaders, and to assert the superiority of English arms. Mr. Disraeli's conventional indignation will in present circumstances rapidly subside.

The next despatches of Sir GARNET WOLSELEY will be expected with much interest. It is generally believed that he intended to enter Coomassie for the purpose of satisfying the Ashantees of his superior force; but the published statement of the submission of the enemy contains no account of his ulterior plans. It is possible that the Government may have received fuller explanations; but probably Sir Garner Wolseley may not have wished to hamper his own discretion by pledging himself to any definite course of action. It must undoubtedly be his wish to finish the campaign at the earliest time which may be found compatible with the accomplishment of his principal object. The Ashantees are probably fully aware that the English troops must be withdrawn during the early spring; and it is well that the rapidity of theadvance has compelled them to form an immediate decision. The details of the expedition are still imperfectly known. Early in January the force for which it was found possible to provide carriage had reached and crossed the Prah without opposition; but the General was obliged to leave without opposition; but the General was obliged to leave some of the troops on board ship, because the native carriers had deserted. It seems to be the destiny of the Fantees to be either extirpated by their war-like neighbours, or, more probably, to become their subjects and slaves. After their incapacity of the supposed that they might be inclined to make themselves useful as followers of the army. It has these been found necessary to dispense ultogether with the the less than the the the less than any useful part in the same of the true. cortain that the less set taken may seeful part in

 $x \in \mathcal{C}_{\mathcal{F}}$

and his levies on the Vella are not mentioned in the recent despetation, and according to some previous reports these auxiliaries had released to follow their leader into the Ashantee territory. It is not improbable that the unopposed march of the English force to the outskirts of the capital may have at last inspired the native allies with some degree of courage. In those regions it is perhaps a startling discovery that the Ashantees are not invincible, and many propertitions would make the opportunity of safe revenge highly attractive. A victory in the field would be even more impressive than an unopposed occupation of the capital; but it may be inferred from the terms of Sir Garrer Wolseler's despatch that he anticipated no further hostilities.

The Government which may be in office when the war is ended will have some difficulty in deciding on the policy to be henceforth adopted on the Gold Coast. The Protectorate which has long had a partial and ambiguous existence will not be deliberately extended; nor will the most enthusiastic of Governors trouble himself with the establishment of a Federal Constitution among the helpless and worthless The abandonment of the English possessions on the coast, including the recent acquisitions from the Dutch, will not be seriously proposed. The English traders will scarcely be prepared to undertake, as on a former occasion, the government of the settlements; and the entire annihilation of English commerce on the Gold Coast would be a strange result of a costly and successful campaign. Probably the most convenient and most prudent course will be to retain the forts on the coast, with garrisons sufficiently strong to repel or to deter Ashantee aggression. It would cost comparatively little to maintain one or two coloured regiments, and to provide them with weapons and artillery which would insure their superiority over mative onemies. Notwithstanding the suspicions and complaints of the Ashantees, it has always been the policy of England to facilitate their commercial intercourse with the coast; and it is possible that the development of a profitable trade might gradually modify their warlike proposities. Any advantage which may directly or indirectly result from an unwelcome and troublesome enterprise will be fully approciated; but the war itself was undertaken not as a speculation, but by absolute necessity. It was impossible to allow the Asbantees to brave the English power with impunity. The cost of punishing them was not a local investment, but a part of the working expenses of the Empire. It is fortunately not likely that the transactions on the Gold Coast will now become the subject of party attack or recrimination. The Opposition either before or after their impending accession to power will share the official instinct of avoiding unnecessary discussion in Parliament; nor is there any longer a sufficient metive for finding fault with the policy of a moriband Ministry. The future Secretary for War will not be eager to establish a precedent for severe criticism of the details of military administration.

FRANCE.

NAME has at length been found for the anomalous Government which now exists in France. It is the "Septennate." French shrewdness has fixed upon the most certain element of Marshal MacMahon's rule. It cannot be called a dictatorship, for the Legislature, or a Minister possessing the confidence of the Legislature, is the real sovereign. Its claim to be a Republic is vehemently denied by a large part of the Assembly, and is only feebly maintained by the Executive. It is not a Provisional Government, for a Committee is nowengaged in constructing a permanent Constitution. But there is one thing about it which, if not certain, is at any rate more certain than anything else. The fact that it is to last for seven years has been proclaimed by Marshal MacMahon himself, and may be taken as accepted by the majority of Frenchmen. The Republican party would prebably be glad to be assured that nothing worse is in store for tham. The moderate Royalists may be supposed to see that, there being no immediate chance of a Restoration, they cannot hope to set a Covernment of a less decided shade of Republicant these have no love for the Dake of Bracket, where, rightly or wrongly, they identify with the masserchical integers of the extensi, but their dislike goes no farther than the Marshally Minister. The only section which is actively heatile the maintain order

AND THE PARTY OF T

of things is the Extreme Right, and though the distribution of parties in the Assembly gives this section an accidental importance in a division, it has no following in the country. To all appearance the Legitimists are quiteaware of their real weakness. They are constantly threatening to break up the majority, and constantly proving untrue to their own threats when an occasion for carrying them out arises.

They have just made another addition to the already long list of these retreats at the last moment. Marshal MacManon has been paying a visit to the Tribunal of Commerce at Paris, and has taken the opportunity to make a reassuring speech. Some new buildings are to be begun, the repairs of the Louvre are to be pushed on, and the forts round Paris are to be reconstructed. In these ways a good deal of employment will be provided for the workmen, and one cause of the present distress removed. In so far as this distress proceeds from political uncertainty Marshal Mac-Manon declares that it has no longer any real foundation. On the 19th of November the Assembly entrusted him with the Executive power for seven yours, and during that time and in the actual state of things he will take care that its decisions are respected. The Extreme Right had till then been declaring that nothing should induce them to support the Government in the coming debate on M. GAMBETTA'S interpellation; but as soon as the Marshalbad thus putdown his foot, they began to look about them to see how they could best retire from the position they had taken up of their own choice. The only thing they cared for was to find a decent bridge, and for this purpose they went to the Duke of Buchate. They could not, they seem to have said, recognize the existing order of things as destined to last for seven years. The Assembly might decree the restoration of HENRY V. in the course of the approaching debates on the constitutional laws, and, if the Marshal's words were meant to guard against this possibility, there could be no peace between the Legitimists and the Government. Probably, if the Duke of BROGLE had set any store by the precise words which the Marshal had used, the Extreme Right would have looked out for some other point on which he might be more pliable. But as he was not woulded to any particular phrase, it was not difficult to invent one which should soothe these factitious sensibilities. In the report of his speech which appeared after some delay in the Journal Official the Marshal was made to say that during the next seven years he would make all men respect "the "legally established order of things." Between the cristing order of things and the legally established order of things there is enough difference to satisfy Legitimist seruples. What this difference precisely is, it is not so easy to say. At present the two are identical. The authority of Marshal MacManon as President of the Republic is both existing and legally established. It is conceivable that it might cease to be legally established, and yet continue to exist, but this is not the objection which the Legitimists entertain towards the original phrase. They can have no fear of Marshal MacManon repudiating the authority of the Assembly and maintaining his place in the Government by force of arms. On the other hand they can hardly look forward to a combination of circumstances in which Marshal MacManon's authority will be legally established, and at the same time not be in existence. because this would imply an intention on their part to effect a Restoration against the will of the Assembly, of which it is fair to say that there is at present no trace in their plans. What they must be supposed to mean therefore is that, if the Assembly at any time during the next seven years passes a law to place the Count of CHAMBORD on the throne, it is this legally cetablished order of things, not the now existing order of things, that they will be bound to support. It does not seem to have occurred to them that there was no need to prefix "new" to the words "existing order of things" any more than to the words "order of things legally established." No one denies that the Assembly which made Marshal Machanon President for seven years can decree some other form of Government which shall override his by virtue of its more recent scention. The Septennate would then cease to be the legally established order of things; and in this possibility the legitimists may foresee a remote possibility of a Restoration. But under these circumstances the Septemmate would equally cease to be "the existing order of "things." The secret hopes of a party which can find attichistion in such quibbles must be near akin to secret Whether the consession of this change of formula

will ensure the majority against the loss of any of its members when the division on M. Gamberta's interfellation is taken remains of course uncertain. The attitude of the Extreme Right towards the Government varies from day to day with their estimate of the Count of Chambobb's ultimate chances, and of the nearness of a dissolution. When they can persuade themselves that there is a long lease of Parliamentary life still before them, they can afford to show some independence. The mere thought of an appeal to the electors is usually enough to impress them with the paramount importance of supporting the only "Government of "honest men" which there is much likelihood of their getting in the present temper of France.

The clections of Sunday last supplied an interruption to the usual tale of Republican successes. In the Pas de Calais the Conservative candidate has been returned. 'The event does not, however, give much cause for Conservative exultation. It is not a gain of a seat; the Republican minority is much larger than at the last election; and the successful candidate is a declared Bonapartist. As regards this last point, it becomes more and more evident that, if the Conservatives wish to prevent the establishment of the Republic, they must not be too particular as to the quality of their allies. In spite of the war, so many recollections of past prosperity are associated with the name of NAPOLEON III. that Imperialism continues to command a considerable number of supporters, and the general suppression of Republican Mayors which is now general suppression of Republican Mayors which is now going on tends to make this section of the population additionally important. It would not answer the Duke of Brooke's purpose to appoint men who have neither official experience nor local influence, and where no large proprietor can be found to undertake the office, an ex-Mayor under the Empire is usually the only person who possesses the alternative requirement. At present it matters little what postionless shade of Con-At present it matters little what particular shade of Conservatism the Mayor represents, but when the Phince Imperial is a candidate for the Throne—and sooner or but when the Paince later, unless the Republic can get firmly seated in the interval, he is sure to be a candidate—it will matter a great deal. By that time the electors may have grown accustomed to voting as the Mayor bids them, and when the labit is once formed, they may go on doing so even when the Duke of BROGLIE's representative no longer represents the Duke of BROGLIE.

MISSING MEMBERS.

A FTER the battle the roll has to be called, and there is a melancholy list of missing combatants. The sympathy of the public is requested on behalf of some two hundred gentlemen who were members of the late House of Commons at the moment of the dissolution, but who will be looked for in vain in the new Parliament which has just been elected. Of these, it is true, a certain number—health, purse, or courage failing them—fairly ran away at the beginning of the conflict. The rest have fallen on the field, and happily it is one on which they may live to fight another day. It will be rather a dull House without Mr. Bernal Osborne's rattling and impartial humour; nor has there been such an accession of wisdom on the part of the new members as to compensate for the loss of Professor FAWCETT's intellectual integrity and logical candour. There will also be wanting Mr. BOUVERIE'S critical sincerity and extensive knowledge of the forms of Parliamentary business. Sir J. Pakingron has held so many high offices that he may almost be regarded as a compendium of the Cabinet; but his fairness and courtesy in debate will be at least as much missed in the House of Commons as his versatility in the Government. Familiar faces have disappeared from all sides of the House, but especially from the side which is occupied by Mr. GLADSTONE'S supporters. Five subordinate members of the Government—the LORD ADVOCATE, Lord members of the Government—the LORD ADVOCATE, LOR ENGIELD, Mr. HIBBERT, Sir H. STORES, and Mr. AYRTONhave lost their seats. Several of those tiresome members who may be said to have set not so much for particular places as for crotchets and agitations will return no more at least for the present. The Liberation Society has at least for the present. lost its loader, and oppressed woman her champion; and the House of Commons will probably be spared some of the clever and hap annual motions under which it has had to suffer so long of distinction, as Of the two members for the Transcense Claimant, one has been taken and the other left; and the Pors and the by rabbing the

Jesuits will still have to tremble at the thought that Mr. Whalley is watching them from the House of Commons. The Turf—a silent interest—will no longer be represented by a pair of its most benourable supporters. Mr. Masser and the late Baron Mayer Rothschild. On the whole, looking generally to the personal character and circumstances of the members, apart from their politics, it cannot be said that the complexion of the new House will be very different from that of the old one. It will be cantially an assembly of safe men, and probably a shafe older, balder, and, if put in the scales, a few stones heavier, than its predecessor. It may also be expected to be rather less fussy, discarsive, and loquacious, and less given to turning itself into a priggish debating club. A considerable number of the members may be trusted to vote better than they can speak, and to support the Constitution by a noble reticence; and this is so far hopeful for public business. It is quite clear that the administration of the country would soon have been brought to a standstill if the flow of talk had gone on increasing year by year as it did during the existence of the late Parliament. There was an old Scotch judge who used to stigmatize any prolitic devocate who took up too much of his time as "the "harangue," and there was certainly an intolerable proportion of the "harangue" element in the late Parliament. The removal of Mr. Mactic will in itself be an important step towards the solution of the Irish Home Rule difficulty, for the hours and days which that interminable talker wasted in a Session would alone be almost enough to enable the House of Commons to pay proper attention to any Irish business that deserved it.

It may be thought that the rejected members who are most to be pitied are the unfortunate gentlemen who were elected at great expense during the recess, and who have had only the barren enjoyment of a nominal distinction. Colonel Campbelli's election expenses in Renfrewshire, for example, came to some 10,000l.; and 10,000l is a good deal to pay for the prospective satisfaction of sitting in a Parliament which is dissolved before you have a chance of taking your seat. It is impossible not to sympathize with gentle-men in this position, who have borne the heat and burden of the day, and who, just as they are about to enjoy their reward, are thrust aside in a scuffle at the door. suspect, however, that those who are after all most deserving of compassion are not the candidates who have never known the delight of taking part in the government of the country by sitting with their hats on in the House of Commons, or drinking tea in the Members' Tea-room, but rather the rejected members who had been in the House long enough to get used to its ways, and to adopt its habits and associations as part of their second nature. It is difficult perhaps for any one who has never. nature. It is difficult perhaps for any one who has never. been in the House to understand its fascinations. should all these wealthy, middle-aged men, who might be so comfortable at home, go mad about getting into Parliament? It cannot be for the sake of speaking, for after all only a comparatively small proportion of the members ever do speak. Still less can it be for the sake of listening to speeches by other men, for anybody who cared very much about that dismal privilege could surely contrive to get admission as a stranger often enough to gratify any natural appetite in that direction. It cannot be from a desire for patronage, for that has been cut down to the chance of a nomination which merely admits to a competitive examination, and this is not a boon which is very highly prized by con-stituents. Where then is the charm? It lies partly, we suppose, in the social pleasantness of the House, which has been often and justly described as the most agreeable club in London. It is not those public utterances which reach the public only a very little while after the members themselves, but the private talk, the gossip, the familiar conversation of the smoking-room and lebbies. which takes such a hold on those who have once become soonstomed to it. The members are very much thrown toacoustomed to it. The members are very much thrown a gether, and there is a good deat of personal friendship in intimacy, irrespective of party views. A man of busine learns first in the House many things which it much on corns him to know, and whatever of interest is going on the world outside is sure to be more or less respectively within. The majority of members are carefully fine to clever or very important in any way, but there we make the clever and important prophs in the House that we of distinction, and to relate a male the majority person is that something of a reflection that the majority is a relative to the first less than a first that we have the latest than a life or relative to the first less than the relative than a life or relative that any and to relative the latest than a life or relative that any than the latest than a life or relative t

ing a word with them. And then not of being in close connection with to give a shove, however feeble, to the nt, and of having the great Bate affairs as it goes round. Whatever the reason, it is at least certain that there a so mismable and dejected as one who has lette seek in the House after having been a member for a number figure. It is enough to frighten a candidate from trying for a seat at all to think of the wretchedness he is preparing for kimself if he happens afterwards to lose it. A more melancholy sight can hardly be imagined than rejected members—with the air of ghosts rather than the context of th haunting the lobby and peering in at the doors through which they had once the right to pass, but which

Great allowance must be made for the feelings of gentleen in this painful position, and it may be admitted that it is not always easy to take a graceful leave of a constituency which has just kicked you out in a very ungracious manner. Mr. Ayrron, however, is equal to the occasion. He has returned thanks to the electors who voted for him, and nothing can be more characteristic than his thanks. There is a certain sense of esthetic satisfaction—and it is pro-bably the only asthetic satisfaction to which the ex-edile ever ministered—in finding that his career has been consistent to its close, and that even at the last he has not deviated into any of the conventional civilities of common mer. Mr. Averon, when in office hearted that of common men. Mr. Ayeron, when in office, boasted that he had "abolished letters," and his letter to his consti-tuents is as curt and brief as a mercantile memorandum. It consists, in fact, of only a couple of lines. Mr. AYRTON thanks his supporters, but without stooping to the weak formality of calling them "gentlemen"—an idle word, which is banished from the vocabulary of unsophisticated honesty. He adds that he is sorry the borough should have taken so little interest in politics, and should have forfeited "its political importance"—that is himself. In a previous speech Mr. AYETON appears to have assumed that his unpopularity was due to his having devoted himself to public business rather than to private affairs; but the circumstance is capable of a different interpretation. His promotion to the Board of Works was, in fact, a flagrant example of that arrogant and wilful temper which has contributed so much to the present humiliation of the Government. It is impossible to imagine a more wanton disregard of public interests, or of the higher motives by which the distribution of responsibility should be dictated, than the way in which a man who not only knew nothing of art and science, but who beastfully paraded his contempt for all such things, was turned loose among artists, architects, and men of science to sneer, and browbeat, and trample on them at pleasure. The insolence of office was never more painfully or mischievously displayed than in Mr. Gladstone's appointment of Mr. Ayeron and in Mr. Ayeron's exercise of his authority. The startling rumour that, after all that has happened, the unfortunate people at the India Office are to have Mr. Ayeron's cynical savagery imposed on them for life, must be dismissed as altogether incredible. Even Mr. GLADSTONE is scarcely capable of that.

LITERARY COINCIDENCES.

LVERYBODY is aware of the fact that no good story was over told for the first time. The nursery stories which delight our infancy have a pedigree dating back to some remote mythology, and the anecdotes which circulate at a modern dinner-table have and the anecdotes which circulate at a modern dinner-table have perhaps in some earlier form set primerval savages in a roar. We heard the other day an American story with the usual flavour of profinity about a trapper in difficulties with a bear, who prayed that, if divine aid were not granted to him, it might at least not be granted to his antagonist. Soon afterwards we encountered the pame sentiment attributed to a Prassian general in Mr. Carlyle's Life of Frederick. Another instance of this familiar process may be given from a deservedly popular ancedote. Pepe talls the story of the gournand who is given over by his dentor after a surfact upon salmon; wherethen

Merty! cries Helino, tilency in my seal!
Is there no hope? Alse! then bring the jow!,
directly copied from La Fontaine; but, according to
Majithustely derived from an according to Athenausa. The
tel Manypears with a characteristic modification in a story.
Heaviloric to Johnson. The chilef difference is that
hel multime? have taken the plant of the allique is that
he multime have taken the plant of the allique.

having resolved to shout bismooth in broubled with
him multimellations his himse out. Exception numerical.

the impression which this anecdote made upon Mr. Pickwick when amplified and told with due attention to dramatic effect by dags Weller. Whether the "Mr. — "had ever a real existence may be disputed. If he had, the story illustrates the uniformity of human nature instead of the vitality of an amusing anecdote in various incarnations.

A similar difficulty suggests itself in regard to many of those pointed sayings of which we cannot my whether two clever use have hit upon the same thought, or one has received it from the other and published it afresh. Take, for example, the well-known saying about the use of language which has been connected with other and published it aireah. Take, for example, the well-known saying about the use of language which has been sonnected with Talleyrand. It belongs to a familiar class of witticisms which are formed by the inversion of truisms. The saying crede quies impossibile, or the statements that extremes meet, that the half is greater than the whole, that a man was fitted for a post and yet greater than the whole, that a man was fitted for a post and yet was appointed, that gratitude is a lively sense of favours to come, and so on, are other specimens of the successful application of a device which we commend to the consideration of anybody who wishes to take out a patent for making smart sayings by machinery. It is natural enough that many clever men should have tried the effect of inverting the obvious truth about the use of language. Three well-known masters of English epigram have certainly approximated very closely to this most popular of witticisms. South gives it as a characteristic precept of the wisdom of this world that "speech was given to the ordinary sort of men whereby to communicate their mind; but to wiso men, whereby to conceal it." Young, in the second satire in the Love of Fame, speaks of the masquerade of court and town:

Where nature's end of language is declined And men talk only to conceal the mind,

Characteristically enough he addresses Chesterfield in the same passage as an instance, not of the rule, but of the exception; otherwise one might have thought that the author of the Letters would be an excellent godfather for the saying. Goldsmith, in the Bes, works out the same antithesis very carefully, first quoting the general principle of grammarians, and then adding that, in the opinion of men who know the world, the true use of speech is not to express our wants, but to conceal them. We need not speech is not to express our wants, but to conceal them. We need not speechate upon the degree in which one of these passages may have directly suggested another; or how the full-blown saying, from which each of them more or less differs, came to be associated with the name of Talleyrand. We may remark parenthetically that mother well-known phrase, which has been given to Napoleon, appears to be of native origin. Dean Tucker, in one of his tracts upon the American war, calls the English a "shopkeeping nation;" whilst the remark about there being but one step from the sublime to the ridiculous is to be found in Tom Paine.

The cause of the failure of South, Young, and Goldsmith to establish a claim to the saying about the use of language is Characteristically enough he addresses Chesterfield in the same

establish a claim to the saying about the use of language is apparently that a certain modesty prevented them from laying down the maxim with sufficient generality. A lurking desire to be more or less accurate has prevented many good things from obtaining entire success. A man who would be witty must not be too A maxim should claim to be the expression of an absolute and invariable law of nature, or it does not startle people sufficiently to fix itself on their memories. We may truce the growth of another familiar saying through a series of authors, and mark how it has improved by increased generality. "God Almighty first made a garden," says Bacon in his sententious style. Cowley adds an antithesis, but makes the phrase too quaint to be

God the first garden made, and the first city Cain.

The remark is pointed enough, but it is now a mere concelt. Cowper has much the same thought, but softens the antithesis, and makes it a general statement instead of a Scriptural allusion :-God made the country and man made the town.

Theologians might raise certain difficulties as to the orthodoxy of this statement; but it is a vigorous expression of sentiment, if not an accurate philosophical formula, and has therefore become part of the current coinage of popular quotation. The phrase reminds us of another saying, round which a good many writers lave wandered, though it waited for one man of genius to establish its success. Our instance may again be taken from South, who wrote to Owen that "Commonwealths put a value upon men as well as to Owen that "Commonwealths put a value upon men as wen as money, and we are forced to take them both, not by weight, but according as they are pleased to stamp them, and at the current cate of the realm." Wycherley uses the same illustration in the first scene of the Plain-Dealer. "I weigh the man," he says, "not his title; 'tis not the King's stamp can make the metal better or heavier. Your lord is a leaden shilling which you bend every way, and abases the stamp he wears instead of being raised by it."
This coincides almost verbally with Borns's familiar lines:—

The rank is but the guinea stamp, A man's a man for a' that.

In this case borrowing is improbable; and the same may be said In this case borrowing is improbable; and the same may be said of many other cases in which obvious images are used by different writers. When Goethe says, in the character of Werther, that it now autumn in him as well as around him, that his leaves are turning yellow, and that the leaves of the neighbouring trees line there is no reason to suppose that he was thinking of the uttarines of another great poet in a Wertherean mood:

Such time of year in me you may behold.

Such time of year in me you may behold,
When yellow leaved, or faw, or none do hang,
Upon those boughe that shake against the cold,
Bare raised choice where late the sweet birds sang.

Here, indeed, the exquisite concluding line gives a charm not to be found in ordinary adaptations of the comparison. Posts he remarked the parallel between the sadness of saturan and of hon remarked the parallel between the sadness of actuum and of human nature too often for such coincidences to deserve much natice. We may, however, mention another case in which a poet may possibly have suggested a happy phrase to a prose-writer, where the thought is not quits so obvious, but where, on the other hand, the resemblance is not so close. Everybody remembers the splendid compliment which Steele pays to Lady Flizabeth Hastings in the Tutler, "To love her was a liberal education." In the Faithful Friends of Heaumont and Fletcher a gentleman says of a lady who has performed in a masque:—

She teaches in her dancing; 'tis indeed A school to teach all we call liberal.

Steele's compliment is very superior, because much less strained; but there is a similarity in the phrase which may suggest the possibility of a hint having been taken.

Our modern poets would generally be too proud to borrow thoughts directly from a previous author. They are not, indeed, too proud to put on old slothes of mediseval or classical fashion; but they would consider themselves insulted if it were suggested that the substance was not their own, whatever may be the form. When we read in Mr. Tennyson's Maud the phrase-

Then let come what come may, What matter if I go mad, I shall have had my day—

we do not suppose that he had even a faint recollection of a spirited passage in one of Dryden's translations from Horace:

Be fair or foul or rain or shine, The joys I have possessed in spite of fate are mine; Not heaven itself upon the past has power, But what has been, has been, and I have had my hour.

In the reigns of the Georges, however, people were not so particular. The two greatest masters in the art of appropriation are Pope and Gray. There is scarcely a phrase in some of Gray's most beautiful poetry for which a precedent may not be produced from English or classical sources; and Pope's mothod, even when he English or classical sources; and Pope's method, even when he was not avowedly translating, was to serve up all manner of scraps from old poets, and set them as gems carefully polished and mounted in the midst of his own verses. Any, ander or examples have been collected by the industry of a hour contact of Pope had not been more anxious from the contact his author's erroneous metaphysics and theological form of the contact his methods, he might have given us a product of the careful of the contact of the careful of the caref us a tribus study of a now rainer observe meaning from chanship. Pope's resemblances to other authors, varying from base been noticed by Warring the Pope's resemblances to other authors, varying from the warright plugiarism to remote suggestion, have been noticed by Warton, Gibbon Wakoffold, by the elder Disraeli in the Curiosities of Literature, and many of them are collected by Mr. Pattison in his recent edition. One or two may be mentioned. The trainablation of Hadrian's verses, called "The Dying Christian to his Soul," which Pope declared to be "just warm from the brain," and to have occurred to him when he waked in the morning, was and to have occurred to him when he waked in the morning, was imitated, if not stolen, from Flatman. The celebrated lamb in the Essay on Man who "licks the hand just raised to shed his blood," was apparently suggested by a lamb in Dr. King's Mully of Mountown, where it is observed that

A gentle lamb has rhetoric to plend, And when she sees the butcher's knife decreed, Her voice entrents him not to make her bleed.

Oldham calls Butler "the glory and the scandal of the age"; and Pope describes Erasmus as -

That great injured name, The glory of the priesthood and the shame.

Another still familiar phrose, "from grave to gay, from lively to comes straight from Boileau

l'asser du grave au doux, du plaisant au sévère.

In other translations, such as a passage ending-

Bonst the pure blood of an illustrious race In quiet flow from Lucrace to Lucrace....

not only the words, but the French sound of the final syllable, has been retained. But to these parallels there is no end; and it need only be said that it, most cases the source is so obvious that there could be no intention of concealment. Gray, a more learned poet, applied the same method as systematically; and the only question is whether the words of his predecessor were unconsciously ringing in his our or were deliberately appropriated. The familiar stanza, for example, which tells us that

Full many a flower is born to blush unseen And waste its sweetness on the desert air-

has so many parallels that the only difficulty is in selection. Pope, for example, speaks in the Rape of the Lock of

Rosen that in desorts bloom and die.

Shoustone in the same strain talks about the "desort's lily," and Young says of nature :

In distant wilds by buman eye unseen.
She rears her flowers and spreads her volvet green;
Pure gurgling rills the lonely drears trace.
And waste their sweetness on the savage race.

Waller has the same thought, and for other parallel passages to the same stansa Gray's editor quotes Bishop Hall, Chamberlayne, Shahspeare, Pindar, and various farginests of Greek poetry. It would be useless to inquire which of these passages or how many

of them may have been present to Gm of many other of his most striking express sent to Guy's saind. The Bear on the mildy drops that warm my he

which comes almost direct from Julius Casar, may be traced with equal case; though it is rather difficult to follow Dissell's conclusion that the Bard was suggested by Hudibras because Butler describes his hero's beard as a "hairy meteor," whilst Gray makes the beard and heavy hair of his bard

Stream like a meteor to the troubled siz.

In Gray the receptive faculty was developed out of all proposition to the productive; and it was only natural that the expectation of a mind so richly stered and so sparing in utterance should be deeply coloured by the food on which it fed. In Pope's case the process of appropriation was more conacious. Barbaps, however, it is worth while considering whether the method deserves to be entirely abandoned. When it is carried to the excess of making English, like modern Latin rocky, a more cents of carefully externed abundanced. When it is carried to the excess of making English, like modern Latin poetry, a mere cents of carefully gathered phrases, it is certainly incompatible with the spontaneity which is essential to poetry of a high order. On the other hand, we are teo apt to forget the value of thorough finish; and we fail to admit that the chief credit is often less due to the nam who hit upon the rough lump of literary one than to the artist who succeeded in an rough lump of literary ore, than to the artist who succeeds tashiouing the crude material as to give it currency in general usage. It is the last touches which are really the most difficult and the most essential, and it is just those touches which modern authors are generally too impatient to bestow.

STRAUSS.

THE announcement in last Tuesday's telegrams of the death of I David Frederick Strauss will hardly have passed unnoticed even anidst the excitoment of a general election. To those Englishmen even who take no interest in theology, or who regard German speculation—as it has been somewhere expressed—as "a vast Hercynian forest out of which Bunsens and other monsters occasionally energe," his name at least will be familiar. He has long been looked apos as the chief living representative of the rationalist or sceptical school of theology, and in this sense his latest work, Der Alte und der Neue Glaube, was made the text of an address delivered last year by Mr. Gladstone at Liverpool College, which provoked a good deal of comment at the time. Nor is such an estimate of his position altogether an unreasonable one. Other writers of kindred tendencies may have shown, like Baur, a more balanced judgment and a firmer argumentative grasp of their writers of kindred tendencies may have shown, like Baur, a more balanced judgment and a firmer argumentative grasp of their subject, or, like Renau, may have attracted, even in Germany, a wider circle of readers than Strauss. The phrase so often applied as a mere idle conventionalism has its full meaning here. It is perfectly true to say that the appearance of the first Leben Jesu in 1835, when the author was only twenty-seven years of ago, "constituted an epoch" in theological literature and thought in Germany. His success as a writer is no doubt due in some measure to that transparent lucidity of style in which be contrasts "constituted an epoch" in theological interature and thought in Germany. His success as a writer is no doubt due in some measure to that transparent lucidity of style in which he contrasts so remarkably with the great majority of his countrymen of whatever school, and which has been not inaptly compared to Böllinger's. But in the rival champions of faith and unbelief that very clearness of language is mainly due to the clearness of thought which distinguishes them from too many of their contemporaries; they know exactly what they mean, and therefore know how to say it. A similar remark might be applied to the late J. S. Mill, whose conclusions in religious matters indeed do not materially differ from those of Straues, though they were arrived at by a very different clusions in religious matters indeed do not materially differ from those of Strauss, though they were arrived at by a very different process. Before however we can adequately appreciate Strauss's place in the history of modern thought, it will be necessary to glance at the antecedent and contemporary state of theological speculation in Europe, and especially in his own country. Meanwhile the main incidents of his uneventful life may be dismissed in a few words. Horn in 1808 at Ludwigsburg and educated for the Protestant ministry, he is described by Quinet as a young man full of candour, sweetness, and modesty, of a spirit almost the Protestant ministry, he is described by Quinet as "a young man full of candour, sweetness, and modesty, of a spirit almost mystical, and saddened, as it were, by the disturbences which had been caused." After completing his university studies, he went in 1831 to Berlin to hear Schleiermacher lecture on the Life of Christ, and returned to Tubingen, where he had already become acquainted with Bour, as a privatelectric in the Protestant Faculty of Theology. The appearance of the Lebra Jasa led to his diamissal in 1835; but four years afterwards theological chair was offered him by the Government at Zurich, from which he was driven by an armed insurrection of the orthodox Protestant party, and thenceforth he devoted himself to a literary from which he was driven by an armed insurrection of the orthology. Protestant party, and thenceforth he devoted himself to a literary career, hardly interrupted by his election in 1846 to a seat in the lite of Wurtemberg which the unpopularity of his strong political Conservations led him soon afterwards to resign. It may be observed in passing that this union of the most revolutionary theories in philosophy and theology with a sigid bureaucray theories in philosophy and theology with a sigid bureaucray of the Stoice—is a very common phenomenon analysis advanced thinkers in Germany; it was disagreeably ensumplied in Gothe. The Loben Jenu was followed in 1840 by a work on Christian Hootrine in relation to Modern Science, in which the partitle ratio views which the matther had hearnt from Hearl are more fully developed. In 1847 appeared Julies the Appeared and in 1858 a Life of Uhieh was Rusten, the author of Rustelle Observations. These are ministry works, but the second

· A STATE OF A

rebellet and the Der All theological trilogy, as t itly remembered occupieds

it, by which Ot ect, and is enas in his latest worse in his latest worse in his latest worse in the France into Germany: "To Englang at and the forging of the weapons, the Drista; Franchmen brought the briskly and d thence into France, and To England's shu fell the is, the work of the Fre thinkers or Deista; Franchmen brought these wespons across the Channel and wielded them briskly and adroitly in constant light skirmsking, while in Germany one man chiefly undertook the regular investment of the Zion of orthedoxy. Voltaire on one side, Reimarus on the other, typited the character of their respective nations." The English Deistie school of their respective of Charleys and Hobban way he called thinkers or Deis which Lord Herbert of Cherbury and Hobbes may be called the founders, and which calminated in the teaching of Tindal and Chubb, was coloured in its later development by the reflex influence of the French sceptical writers who had received their first inspirations from this country; it became less serious and more aggressive, and the sneering tone of Voltaire and Diderot is reproduced in Gibbon and Tom Paine. Far different, as a rule, is the tamper of German rationalism. But in the first half of the sighteenth continue the whilesandian is the temper of treman retonalism. Dut in the first tail of the eighteenth century the philosophical speculations of Wolff combined with the introduction of English Deism through translations of Tindal and other writers and the influence of French infidel refugees at the court of Frederick II.—himself something beyond a Deist-to stir the sluggish waters of traditional Lutheran orthodoxy. Between that time and 1835 we may trace first a destructive and then a reconstructive period in German Protestant theology. The destructive criticism was begun by Semler, a Professor at Halle, who meant however to be an apologist, but remodelled the Canon of Scripture on a priori grounds, and first introduced the distinction, of which Baur and others have so largely availed the distinction, of which Baur and others have so largely availed themselves since, between St. Peter and St. Paul as leaders of two opposite parties in the Early Church. Lessing, of whom Strausa is reported to have left an untinished biography, though perhaps himself rather a doubter than a Deist, gave a powerful impulse to the same movement by the publication of the Wolfenbittel Fragments of Italianus. The rationalistic criticism of Semiler was continued by Eichorn and Paulus, who eliminated the superpartural element from Scriptura altogether, while maintaining supernatural element from Scripture altogether, while maintaining its historical accuracy. The miraculous portions of the narrative were not denied but explained away. Thus e.g. the healing of the sick was effected by natural means or by a kind of magnetic influence on their minus, the multiplication of the loaves by a secret supply, walking on the value magnet walking on the secret supply, walking on the water meant walking on the bank beside it, and the Resurrection itself was only a way of recording the fact that the Saviour had never really died on the Cross. The critical and moral difficulties of this method of interpretation have been by no one more mercilessly exposed than by Strauss himself; but it was popular for a time, and was applied to Christian doctrine by writers like Bretschneider, Röhr, and Wegscheider. The philosophical teaching of Fichte, Schelling, and Wegscheider. The philosophical teaching of Fichte, Schelling, and Hagel tended of course in the same direction, though they came into less immediate contact with the theological controversies of the day. It was only natural that a reactionary movement should be provoked, and it was equally natural in a country of mixed religious like Germany that it should assume a double form. On the one hand there commenced with the present century a Catholic reaction, of which Count Stolberg, Frederick and Augustus Schlegel, Tieck and Novalis are leading representatives, though only the first two actually joined the Roman Catholic Church. On the other hand Schleiermacher, who was, as we have seen, one of Strauss's earliest teachers, attempted in his as we have seen, one of Strauss's earliest teachers, attempted in his Glaubenslehre to find a basis for orthodox belief, or rather orthodox sentiment, by founding it on the collective Christian consciousness; but in fact, as Strauss has pointed out, he gave up the genuineness of the Gospels, the divinity of Christ, and the reality of prayer, which for him had a purely subjective value. His treatment of the New Testament minacles differs in form rather than in substance from that of Faulus. Religion became in his hands a matter of devout emotion, independent of history and dogma, and he created a spirit rather than founded a school. De Wette and Ewald, and still more of course Neander—whose Life of Christ ne created a spirit rather than founded a school. De Wette and Ewald, and still more of course Neander—whose Life of Christ was expressly designed as an answer to Strauss—returned more nearly to the Evangelical standard of orthodoxy; while the advanced Lutheran achool represented by Hengetenberg, Hisvernick, and Stabl—which was partly a reaction from the suffered fusion of the Lutheran and Calvinist Churches in 1817—may even be said to have some analogy to the Tractarian movement in England. Thus we are brought to the appearance in 1837 bif the first Leben Jess, which was a protest, addressed, as the author was careful to explain, not to the general public but to acholam, at once against the rationalism of Paulus and the mysticism of Behleismancher; not however a protest in the interests of orthodoxy.

The Leben Jess may be divided into three parts, the first giving an introductory shouth of previous systems of Biblical criticisms and the formation of the mythical theory, the second examining the Gospelharmative in detail; the third and concluding postion of the "Christology of the Orthodox systems," which is shown to have its roots in the New Testament, the author describes in a standar of almost rapturous eloquence. The life of Christ "so fail of Blancing and devation, encouragement and counfort," which

. F. S.

prevailed in the early Church. These were abundant united he adds, in the New Enstament for constructing the rule of S eventually formulated in the so-called Apostles Orsed; and eventually formulated in the so-called Apoetles Greed; and the condempation, as they arose, of the mescanive hereafes, from the Ebionite to the Monthelite, which contradicted that faith, was fully justified. Nearly thirty years elapsed before the author published in 1984 his second Labre Jess, addressed this time not to a learned but to a popular audience, as he rather oddly expresses it, "as Paul turned to the Gentiles, when the Jews rejected his Grepol." But the two works differ in form, not in principle, and the profess to the latter contains a distinct allimation of their essential identity. The "Christology of the Church," is still represented as the product of several "groups of mythe," of which twelve are enumerated; but the word must not be understood in the sense which Comparative Mythology, as treated by Professor Max which Comparative Mythology, as treated by Professor Max Miller and Mr. G. W. Cox, has attached to it. The Gospel myths are not a postical presentation of surrise and sunset or other natural phenomena, but have grown up round a medeus of historia fact. The personal existence of Ohrist, which was left uncertain in the earlier work, is now expressly attruck—and here we trace the influence of the Tubingen school, which practically means of Baur, on the mind of Strauss; but he insists that there are few great men of whom so little is known, and that the religion which his name was created by St. Paul rather than by himself. 6 Little of his real history can now be certainly ascertained; what is certain is that the supernatural acts and events on which the faith of the Church has chiefly fastened never occurred at all." of the Church has chiefly fastened never occurred stall." It is true however that the divine wisdom was remarkably (in ausgravichmeter Weise) manifested in him, but his example can only be regarded as a partial and onesided one, for, as it is elsewhere stated with much force against Keimperhaps also with a view to Schleiermacher—so long as he is regarded as a mere man, he cannot be said to represent the perfect ideal of humanity. These views about the life and character of our Lord are repeated and dwelt upon in Strauss's last work. The distinction between the old orthodox Christianity—which is again declared to have been the belief, and the natural which is again declared to have been the belief, and the natural belief, of the early Church -and the religion of the future is drawn out at length in the preface to the second Leben Jesu, and resolves itself into the substitution of a purely rationalistic and intellectual system for a faith resting on a professed revelation. And therefore the Church, whether Catholic or Protestant, must be superseded, for a supernatural religion with sacraments and means of grace sarily implies a sacordotal hierarchy, and the first step towards getting rid of the priesthood is to eliminate the supernatural element from religion. The author, while differing in important points from the Vis de Jésus, which had an enormous circulation in the came guess. His book course with a love dedication to the in the same cause. His book opens with a long dedication to the memory of his brother, who died within a few months of its memory of his brother, who died within a few months of its publication, and who is congratulated on his manly endurance of a long and painful illness without the fictitious aids of a supernatural belief. If there is little difference of view between the earlier and later versions of the Leben Jesn, the closing work of the series, which followed after an interval of eight years, does but sum up and expand in what is meant for a sort of literary testament, the conclusions previously arrived at. It is mainly an answer to two questions, "Are we still Christians?" and "Have we still a Religion?" And it is characteristic of the attribute forward honests and electrons. characteristic of the straightforward honesty and character of thought which those who differ from him most widely cannot fail to respect, that the author replies to his first question with an emphatic negative. There are those who talk of a Christianity purged of all Christian dogma, a Christianity in short which is sufficiently enlightened to dispense with Christ. But Straussenys in effect, what an admirer of his system has lately repeated in this country, "To proclaim an undogmatic Christianity is to proclaim that Christianity is dead." As he himself puts it, "Christianity is dead." anity is a definite form of religion; it is possible to relinquish it and still to be religious, but not still to be Christians. And accordingly, speaking for himself and those who agree with him, "If we would speak as honest upright men, we must acknowledge that we are no longer Christians." He will have nothing to do with the importunity of the contract of the contra that we are no longer Christians." He will have nothing to do with the ingenious devices of a subtle rationalism or a vague and inconsequent pictism, by which so many of his predecessors and contemporaries have sought to deceive both their followers and themselves, but says plainly that Christian theology must be replaced by "the modern kosmic conception educed painfully from scientific and historical research." There is a quiet humour in the passage where he draws out in detail the supposed teaching of a Protestant pastor who has found himself obliged to explode one by one each pastor who has found number contract to exploite one by one each successive article of the Apostles' (freed, the first not excepted. For it is in fact a "mere Hebrew prejudice" to suppose that monotheism is necessarily superior to polytheism; both were but temporary stages in the gradual advance to a higher truth. The ideas of a personal God and a future life are now shown to be unsuccessful. ideas of a personal God and a future life are now shown to be antenable, but we need not therefore acquiesce in the pessimian of Schopenhauer, which is "biaphenous, arrogant and profane," admit that we have no religion. On the contrary, "we claim to same plety for our Kosmos which the devout of old claimed for his God." But of course the notion of religion acquires, on this layesthesis, a wholly new meaning. It will no longer produce a winship, though it will not fail, the author thinks, to exert a moral influence—an assumption which, except in the case of very parallely constituted natures, may well be questioned. It is to consist in dependence on the Kosmos, in other words, on the laws of

the material universe; and that, we are bidden to believe, is a far truer and nobler conception than the "low anthropogathism" of

dependence on God.

This is not the place to examine the merits, religious or historical, of t trausa's theological system, if a system which ends in pure materialism is to be called by such a name. The praise of a fearless and consistent thinker, and a luminous expositor of the views he had deliberately adopted and held unflinchingly to the last, he may fairly claim. There is no reason to doubt the sincerity of his almost dying assertion, made, as he assures us, under a solemn sense of the duty of giving an account of his stewardship, that he fought through life for that which appeared to him as truth and against what appeared to him as untruth, while he disclaims all desire to shake the faith of those who have not already lost it. Strauss's originality of genius, we cannot but think, has sometimes been overrated. Apart from his negative criticism there is very little really new in the theories he selvocates. He began and ended as a disciple of Hegel, though Hegelianism has no doubt been very variously interpreted; and we will not undertake to affirm, especially when we have no space left to discuss the question, that his interpretation of his unaster is the most correct, as it is certainly a very common His intellect was clear and critical rather than creative, and in historical grasp he was certainly inferior to Baur, to whom indeed he owed a good deal. But he has left his mark, whether for good or evil, on German theology; and for one important service at least all serious believers are indebted to him, however little they may sympathize with his barren and unhopeful creed. He has unmasked a host of shams, if he has put nothing better in their place, and has made the elaborate, however unconscious, subtorfuges of such teachers as Somler, Schleiermacher, and Paulus for ever impossible in the future. In him, whatever be his faults, the advocates of revelation need fear no treacherous ally; he meets them with the downright challenge of an able, an honest, and an them with the downright challenge of an able, an honest, and an open foe.

THE DISCONTENTED WOMAN.

THE discontented woman would seem to be becoming an unpleasantly familiar type of character. A really contented woman, thoroughly well pleased with her duties and her destiny, may almost be said to be the exception rather than the rule in these days of timultuous revolt from all fixed conditions, and vagrant energies searching for interest in new spheres of thought and action. It seems impossible to satisfy the discontented woman by any means short of changing the whole order of nature and society for her benefit. And even then the chances are that she would get wearied of her own work, and, like Alexander, weep for more worlds to rearrange according to her liking, with the power to take or to leave, as her humour might decide, the duties she had voluntarily assumed, as she claims now the power of discarding those which have been given her from the beginning. As things are, nothing contents her, and the keynote which shall put her in harith existing conditions, or make her ready to hear the disagreeable burdens which she has been obliged to carry from Eve's time downward, has yet to be found. It she is unmarried, she is discontented at the want of romance in her life; her main desire is to exchange her father's house for a home of her own; her pride is pained at the prospect of being left an old maid unsought by men, and her instincts rebel at the thought that she may never know maternity, the strongest desire of the average woman. But if she is married, the causes of her discontent are multiplied indefinitely, and where she was out of harmony with one circumstance she is now in discord with twenty. She is discontented on all sides; because her husband is not her lover, and marriage is not perpetual courtship; because he is so irritable that life with him is like walking among thoras if she makes the mistake of a hair's-breadth; or because he is so imperturbably good-natured that he maddens her with his stolidity, and cannot be made joalous even when she firts before his eyes. Or she is discontented because she has so many household duties to perform, the dinner to order, the books to keep, the servants to manage; because she has not enough liberty, or because she has too much responsibility; because she has so few servants that she has to work with her own hands, or because she has so many that she is at her wit's end to find occupation for them all, not to speak of discipline and good management. As a mother, she is discontented at the loss of personal freedom compelled by her condition, at the physical annoyances and the mental anxieties included in the list of her nursery grievances. She would probably fret grievously if she had no children at all, but she first quite as much when they come. In the former case she is humiliated, in the latter inconvenienced, and in both discontented. Indeed, the way in which so many women deliver up their children to the supreme control of hired nurses proves practically enough the depth of their discontent with maternity when they have it when they have it.

If the discontented woman is rich, she speaks despondingly of the difficulties included in the fit ordering of large means; if she is poor, life has no joys worth having when frequent change of scene is unattainable and the milliner's hill is a domestic calculity that has to be conscientiously curtailed. If she lives in London, she laments the want of freedom and fresh air for the children, and makes the unhappy father, toiling at his City office from ten till seven, feel himself responsible for the pale cheeks and attenuated legs which are

probably to be referred to injudicious diet and the frequent juvenile dissipations. But if she is in the country, then all charm of experience is centered in London and its thorought charm of existence in dentered in London and its lateragement, and not the finest accenery in the world is to be compared with the attractions of the shops in Regent Street or the growds through Cheapside. This question of country living is one that present heavily on many a female mind, but we must believe that, in spite heavily on many a female mind, but we must receive any, in of the plausible reasons so often assigned, the chief causes of discontent are want of employment and deadness of interest in the life that lies around. The husband makes himself happy with life that lies around. The husband makes himself happy with his rod and gun, with his garden or his books, with the hant or the bricklayer, as his tastes lead him; but, the wife—we are speaking of the wife given over to disappoint and addiscontent, for there are still, thank Heaven, bright, busy, happy women both in country and in town—sits over the fire in winter and by the empty hearth in summer, and finds all barren because she is without an occupation or an interest within doors or without. Ask her why she does not garden, if her circumstances are of the kind where hands are scarce and aven a lady's energies would do not not a string among the flower even a lady's energies would do potent service among the flower beds, and she will tell you it makes her back ache and she does not know a weed from a flower, and would be sure to pick up the young seedlings for chickweed and groundsel. If she is rich and has men about her who know their business and guard it jealously, she takes shelter behind her inability to do actual manual labour she takes shelter behind her inability to do astual manual labour side by side with them. Active housekeeping is repulsive to her, and though her servants may be quasi-savages, she prefers the dirt and discomfort of idleness to the domestic pleasantness to be had by her own industry and practical assistance. Unless she has a special call towards some particular party in the Church, she does nothing in the parish, and seems to think philanthropy and help to one's poorer neighbours part of the ecclesiastical machinery of the country, devolving on the rectory alone. She gets bilious through inaction and heated rooms, and then says the place disagrees with her and will be the death of her before long. She cannot breathe among the mountains: the moor and plain are too cannot breathe among the mountains; the moor and plain are too exposed; the sea gives her a fit of melancholy whenever she looks at it, and she calls it cruel, crawling, hungry, with a passion that sounds odd to those who love it; she hates the leafy tameness of the woods and longs for the freer uplands, the vigorous wolds of her early days. Wherever, in short, the discontented woman is, it is just where she would rather not be, and she holds fate and her husband cruel beyond words because she cannot be transplanted into the exact opposite of her present position. But mainly and above all she desires to be transplanted to London. If you were above all she desires to be transplanted to London. If you were to get her confidence, she would perhaps tell you she thinks the advice of that sister who counselled the Lady of Groby to burn the house down, whereby her hushaud would be compelled to take her to town, the wisest and most to the purpose that one woman could give to another. So she mopes and moons through the days, finding no pleasure anywhere, taking no interest in anything, viewing herself as a wifely martyr and the oppressed victim of circumstances; and then she wonders that her husband is always need to be see her coursely and that he avidently finds her more ready to leave her company, and that he evidently finds her more tiresome than delightful. If she would cultivate a little content she might probably change the aspect of things even to finding the mountains beautiful and the sees sublime; but dissatisfaction with her condition is the Nessus garment which clings to the unhappy creature like a second self, destroying all her happiness and the chief part of her usefulness.

Women of this class say that they want more to do, and a wider field for their energies than any of those assigned to them by the natural arrangement of personal and social duties. As administrators of the fortune which man earns, and as mothers—that is, as the directors, caretakers, and moulders of the future generation they have as important functions as those performed by vestrymen and surgeons. But let that pass for the moment; the question is and surgeons. But let that pass for the moment; the question is not where they ought to find their fitting occupation and their dearest interests, but where they profess a desire to do so. As it is, their discontent takes one form among many of this desire for an enlarged sphere; yet when they are obliged to work, they bemoan their hardship in having to find their own food, and think that men should either take care of them gratuitously or make way for them chivalrously. In spite of Scripture, they find that the battle is to the strong and the race to the swift, and they do not like to be overcome by the one or distincted by the other. Their idea of a clear stage is one that includes favour to their own side, yet they put on airs of indignaswift, and they do not like to be overcome by the one or distanced by the other. Their idea of a clear stage is one that includes favour to their own side, yet they put on airs of indignation and profess themselves humiliated when men pay the homage of strength to their weakness and treat them as ladies rather than as equals. Elsewhere they complain when they are thrust to the side by the superior force of the ungodly sex; and think themselves ill-used if fewer hours of labour—and that labour of what Mr. Carlyle calls a "slim" and superficial kind—cannot command the market and hold the field against the better work and more continuous efforts of men. There is nothing of which women speak with more bitterness than of the lower rates of payment usually accorded to their work, nothing wherein they seem to be so utterly incapable of judging of cause and effect, or of taking to heart the unchangeable truth that the best must necessfly win in the long run, and that the first condition of equality of payment is equality in the worth of the work dosers! I women would perfect themselves in those things which they to already before carrying their efforts into new fields, we cannot but think it would be better both for themselves and the world.

Lafe is a hewildering tangle at the best, but the discontented

women is not the one who is disposed to make it smoother. The crass for sincitement and for unbanistic publicity of life has possessed her, to the temperary explusion of many of the sweeter and more modest qualities which were once distinctively her own. She must have movement, action, fame, notoriety, and come to the front on public questions, no matter what the subject, to ventilate her theories and show the quality of her brain. She must be "prochanced" all the same as man, with M.D. after her mans; and perhaps, before long, she will want to don a horsehair wig over her chignon and address "My Lud" on behalf of some interesting triminal falses red-handed, or to follow the tortuous windings of Chandely practice. When that time comes, and as soon as the movelty has worn off, she will be sure to complain of the hardness of the grind and the wors of competition; and the obscure female spothecary struggling for patients in a poor neighbourhood, the enemployed lady lawyer waiting in dingy chambers for the clients that never come, will look back with envy and regret to the time when women were cared for by men, protected and worked for, when women were cared for by men, protected and worked for, and had nothing more arduous to do than attend to the house, spend the money they did not earn, and forbear to add to the anxisties they did not share. Could they get all the plums and some of the suet it would be fine enough; but we question whether they will find the battle of life as carried on in the lower ranks of the hithests measuring professions one whit mens arounding or the hitherto masculine professions one whit more ennobling or inspiriting than it is now in their own special departments. Like the poor man who, being well, wished to be better, and came to the grave as the result, they do not know when they are well off; and in their search for excitement, and their discontent with the monotony, undutifulness, and inaction which they have created for themselves, they run great danger of losing more than they can gain, and of only changing the name, while leaving untouched the real nature, of the disease under which they are suffering.

THE CLUBS AT ELECTION TIME.

THERE is no more animated scene in its way than the interior of one of the great political Clubs in the height of a general election. Time was when the dregs of the democracy had the best of the fun; when the plee looked forward to the saturnalia under the hustings, and, after freely refreshing itself at the expense of the rival candidates to the profit of the great licensed victualling interest, went in for window-smashing as an expression of political conviction, and possibly sacked the polling-booths by way of finale. But things are changed altogether, and election times out of doors are become exceedingly dull. The good old traditions of narty warfare seem only to survive among the enfranchised of party warfare seem only to survive among the enfranchised colliers and ironworkers of the Northern and Midland counties. The very metropolitan boroughs are perfectly peaceful, and the announcement of the poll in Westminster or Marylebone scarcely draws as much of a crowd as a Japanese juggler or a barrel-organ. Whatever we may say of the transfer of power, it is certain that the extension of the franchise has shifted the excitement bodily from the working classes and the efficient of their acciel superiors, while the newfangled institution riff-raff to their social superiors, while the newlangled institution of the Ballot has tended strongly in the same direction. Formerly the advent of an election, however sudden it might have been, found a great many worthy members perfectly easy in their minds. They knew to a shade the sentiments of their constituencies, and their constituents knew them. The local organization of the party was perfect, and the rolls of the rank and file were always kept regularly made up. You could depend upon bringing a certain number of independent supporters to the poll, where, with the eye of the party upon them, they would be forced to vote straight and aquare. In cases where an election was a foregone result, straight and square. In cases where an election was a foregone result, and a simple question of indisputable figures, it was worth no man's while to trouble the sitting member. Now all that is changed, and surprises and forlorn hopes are come into fushion. Many of the constituencies have "grow'd out of knowledge," like Master Copperfield, and can neither be canvassed satisfactorily nor counted upon. Those which are the most manageable, so far as numbers go, are become so exceedingly slippery that there is no possibility of getting a grasp of them. In these the vote used to be a valuable property, and each elector was in the way of negotiating its disposal in person. Now that the vote has lost its market value, in consequence of the increase of the supply and the difficulty of guaranteeing its acquisition to the purchaser, the possessor turns value, in consequence of the increase of the supply and the dimensive of guaranteeing its acquisition to the purchaser, the possessor turns rusty when his interest is requested. He declines altogether to pledge himself in any way; or, if he is of a genial disposition, he pledges himself with frank cordiality to the one side and the other, making any amount of mental reservations. The consequence is that we have an almost universal uncertainty, inviting the advances of making politicisms: while there are quence is that we have an almost universal uncertainty, inviting everywhere the advances of pushing politicians; while there are sourcely a dozen boroughs that can be pronounced asfe from the attempts of some exmest adventurer of ranguins temperament. Add to all this the infinity of novel agitations, pushed simultaneously in favour of a variety of reforms to be embodied in the constitutions of future Utopias; that each section of agitators may be manipulated by any enthusiast who is prepared to stand in its interest; and we can understand how many politicians have been swimming in hot water since Mr. Gladstone issued his sense-

Excitement is contagious, and it was by no means those who more most nearly interested who have been making the most fuss in a matter. On the day of the grand amountement, and by the ment, and by the

time outsiders had begun to gather into their Clubs, most of the members of the defunct Parliament had absented themselves on urgent private affairs. They were weaving their nets to estable voters, consulting over pledges and promises, wiring messages to agents, allies, and committeemen, or scatturing theirselves by express trains towards their counties and boroughs at the various points of the compass. These men had their work out out for them, and sufficiently short time to do it in; their lines key plain enough before them, however numerous might be the obstacles and pitfalls. But there were others, and pleaty of them, who were taken all aback. They had set their hearts on contributing their intelligence to the deliberations of the new Senate; but they had scarcely taken thought for their final arrangements. Gentlewere taken all aback. They mad not their descriptions of the new Senate; but they their intelligence to the deliberations of the new Senate; but they had scarcely taken thought for their final arrangements. Gentlemen who had been keeping some particular seat in their eye hurried madly to the head-quarters of the party to hid for the backing of the wire-pullers, who were sitting upstairs in secret cancus, and to obtain from them authoritative certificates of eligibility, without which their candidature would be a coatly farce. There were other gentlemen of vaguer views, whose schemes were still less developed, who rushed distractedly about in search of some situation that might suit them. Men who have served their apprenticeship to politics have generally cultivated a measure of salf-coatrol, and can affect the indifference which they are far from feeling. But parvenus on their promotion are usually incapable of such hypocrisy, especially when agitated by the shock of a surprise. For But parvenue on their promotion are usually incapable of such hypocrisy, especially when agitated by the shock of a surprise. For years they may have been hovering like so many elderly Peris around the gates of the Paradise of Westminster; drawing nearer and nearer as they seared upwards in the social scale, casting wistful glances at the glories within. Now the chance has come to them of a sudden, and while the precious moments are on the wing it is alipping fast through their fingers. If it cludes them this time the odds of their than many adverse a probation of some air reservements. odds are that they may undergo a probation of some six years more before it repeats itself, and a half-dozen of years may mean ages of torture to a bloated democrat in the seme and yellow leaf. Organia and Plutus, for instance, had been ballotted into the Club for the sake of the weight their wealth might be supposed to carry with it. Crossus had enriched himself in oil, and Plutus had made his it. Crossus had enriched himself in oil, and Plutus had made his fortune in tallow. Socially, they could scarcely be called acquisitions. They had seldom many words to say for themselves, and when they spoke they stuttered, in the awkwardness of their false position. Shy in the sight and hearing of some men, they awaggered with others or before the waiters. But to secure seats in Westminster would add cubits to their stature, and even if shyness or parsimony got the better of their ambition, their worthy wives will hear of no objection. At this moment Mrs. Crossus is standing off and on in the chocolate berouche with the orange liveries, opposite to the portals of the "Radical," to keep her husband up to the mark; while Mr. Plutus has been sent to the "Reactionary" with a fice in his ear, and a warnfilk not to show himself again in his home unless he can bring back at least a promise of a candidature. Each gentleman grows hotter at least a promise of a candidature. Each gentleman grows hotter and more savage as he grows more auxious. It seems probable that It seems probable that Mesers. Crossus and Plutus will be left out in the cold, and the agitation of these unfortunates is in remarkable contrast to the external composure of some of the older hands who are stready wen in the thick of it. Some of the men who are standing for provincial sests may statch an afternoon to run up and refresh themselves at the fountains of political gossip, while gentlemen who are courting the favour of metropolitan constituencies occasionally desert the committee-room for the Club, seeking brief relief from the importanties of agents and admirers. Composed as they may appear that the strength of combat about with them, which composure of some of the older hands who are siready well in the committee-room for the Club, seeking brief relief from the importanties of agents and admirers. Composed as they may seem, they carry an odour of combat about with them, which stirs the susceptibilities of those who come in contact with them. Electioneering battles are not what they used to be, when Fox contested Westminster, or Brougham fought the magnates of the Northern counties; but they still throw a halo of heroism over the champion who contests the suffrages of a numerous constituency with the prospect of its being a near thing. At the "Italical" the "old and tried friend of the people," who stands on the one side, is generally considered as much of a bore as At the "Radical" the "old and tried friend of the people, who stands on the one side, is generally considered as much of a bore as "that distinguished advocate of constitutional principles" who is opposing him, is at the "Reactionary." Yet now idlers and loungers sneak after one and the other, receiving respectfully their expressions of opinion, and seizing eagerly on any crumbs of information which the hero of the moment may chance to let fall. For all their assumed composure, neither the Friend of the People nor the champion of the Constitution is half so tranquil in his mind as he seems to be. The former may be staking on the elecmind as he seems to be. The former may be staking on the elec-tion the chances of retaining his place among the subordinates of the Ministry. The official income may be something more than a consideration to him, nor are the expenses of the contest likely to be insignificant. To him rejection may mean political eclipse or even annihilation. He has get used to the seat he has been sitting in through three Parliaments, although metropolitan cushions are for the most part stuffed with straw. He cannot think where he should cast about for another, and he does know that other unfortunates of his party will have claims prior to his own. His Constitutional rival may have less substantial cause for anxiety, but he does not worry himself much the less on that account. true that he has never sat in the House before, and so far he risks mothing except his money, but then he is keenly sensitive to being made ridiculous. Venturing on the Ballot into a Radical constitutions who set small store by the most solemn pledges, he is seriously apprehensive of a defeat that would cover him with ridicule. And he would regard the loss of his money as a trifle compared to the consciousness that he had made a fool of himself.

As the polling proceeds and the returns come in, so it becomes possible to distinguish the first symptoms of the set of the current, excitement goes up to fever heat. To horrow a mataphor otherwise applied by the coming Premier in his speech at Buckingham, the members are clustering like swarming bees round a great square stand in the central Hall. On that stand are displayed a succession of scrolls, setting out in red ink and black a chart of the electioneering situation. The scrolls are being perpetually corrected up to the latest moment; announcements are impending from some of the great representative centres of industry, from a good many small boroughs which may come to be suppressed some day if they do not see to increasing their population, and from a county or two. As to the reports from the former, they are of vital consequence to the party, for obvious reasons. current, excitement goes up to fever heat. To borrow a n they are of vital consequence to the party, for obvious reasons. So a good many of the veritable party leaders are about, evidently impatient and curious like their neighbours, which of course aggravates the sense of suspense in humbler and more excitable mortals. Then there is a handful of happy men who have already passed the ordeal and qualified for the new Paradisc. They have posted up to town partly to be congratulated on their personal good fortune, principally to indulge in the luxury of sympathy with political aspirants less lucky than themselves. There may be men whose own trials are before them, who shake in their shoes in foreboding apprehension of the result, and who strive to divert their minds in the meantime by forgetting themselves in the broader sympathies of party. Above all, there are those idlers and loungers we have spoken of, and it is curious to remark the amount of factitious earnestness which the most shallow and impassive of commonplace mortals are capable of getting up upon so exceptional an occasion. Take the one who makes himself most prominent. He is dull and heavy and well over his first youth, although it is only a year or two ago that he has begun to suspect it. To their grief, he is on speaking terms with most of the members of consideration, and is in the way of addressing them but his humanus. He darming mutil laurehood in over them by their surnames. He dawdles until luncheon time over his late breakfast, when he lies in wait for those he delights in boring. If o never sat for anywhere in his life; he could not utter a couple of consecutive sentences in public, or write a paragraph of grammatical English; he would not recognize an original idea of grammatical English; he would not recognize an original idea if he had one by any accident; he never spent a shilling for any but a strictly selfish purpose. Yet now he literally rises to the occasion, for he leaves the armehair in which he generally lolls, and bustles about upon his unwieldy legs, swelling with self-consciousness and self-importance. He makes himself hailfellow-well-met with any one who is in the smallest degree a public character. He carries a metallic pencil and a memorandum-book in his waistcoat-pocket, and jots down small calculations of his own with an air of mystic importance. His calculations of his own with an air of mystic importance. His unit eyes are beaming with something like intelligence, and his rubicund face is flushed with excitement, and he potters about as if it were he who had been educating popular opinion and then as if it were he who had been educating popular opinion and their organizing the converted masses for this great and glorious campaign of Armageddon. The man is for the time being galvanized, although he is not by any means inspired. He is quite insensible to the humorous twinkle in the eye of a good-humoured probable Minister, whom he has butten-holed by main force and is worrying unmercifully. He represents an exceedingly numerous class, although doubtless he exaggrates their objectionable qualities; and it is he, and men like him, who really get up the Club agitation in election times, and who originate the "Club opinion" which we hear outsiders speak of so respectfully.

M. MICHELET.

N. M. Michelet France has lost a brilliant and courageous writer who was not the less a poet because he wrote in presc. He called himself an historian, and of his right to the title we shall have something to say. The great French Revolution looks so remote in history that it is sometimes startling to reflect how little distant it is, after all, from our own day. M. Guizots father perished under the guillotine. M. Michelet's father was a printer of resignate whose press was established in a dismantled printer of assignats, whose press was established in a dismantled chapel. Both historians have lived to witness two other revolu-, the overthrow of three dynasties, and two Republican experiments; and M. Guizot would probably concur in M. Michelet's observation, that the pace of the age has certainly been doubled, although he might suggest that the latter had certainly his share in quickening the revolutionary pulses of his countrymen. Michelet's writings are full of democratic violence, and the spirit of the Republic under which he was born breathes in his rhapsodies about Liberty and his fury against Kings. The preparation of his History, he said, was very painful to him on account of the bitters in the cup. "J'ai avaid trop de fléaux, trop de vipères, et trop de rois." His democratic sympathies gained him popularity in 1830, and in 1848 his shricking pamphlets against the Jesuits made him the hero of the banquets of February. He had been suspended by M. (Fuizot, but he resumed his lectures under the Republic. In 1850 the country Europea had been a cost its abandow over Evance. the coming Empire had begun to cast its shadow over France.

"Every literary voice was silenced; every life seamed to be broken
off. Seeing nothing but my work in the recesses of the archives, toiling alone upon the rains of a world, I could fancy for the moment that I was left the last man." Michelet had held the position of Chief of the Historical Section of the National Archives since 1830, and the Chair of History in the College of France

pince 1838. Under the Empire he lost them both, missed from his Chair for the tone of his lectures, wh m both. He was di ontspoken for the Government, and from his post in Birector of the Archives because he refused to take the oath of sllegisnes; and was left without a passion. He was afterwards burned out of his house at Paris by the Commune; and when he applied to be madmitted to his Professomhip, was repulsed by the Government of Versailles. It may be conceived, therefore, that he had not a very Versailles. It may be conceived, therefore, that he had not a very high opinion of any of the Governments under which he had lived. On quitting his Chair he retired to Nantes, and devoted himself to the completion of his History, which he had begun in 1830, and which occupied him nearly forty years. In the first changer of that work he quotes from Straho the description of the Gadis by the philosopher Posidonius:—"The ordinary character of the Gallic race is that it is irritable and mad about war, prompt to fight; for the rest simple and without malignity. If they are angered they march all together straight at the memy, and attack him in the front without thinking of anything also. Thus by trickery it is easy to bring this about; they are drawn on to fight when one wishes or where one wishes, the meann mattering little." M. Michelet lived to witness in the catastrophe of Sedan what he would no doubt regard as an illustration of this gonerous weakness of the French character. Although he had passed through several stirring periods, his own life was not particularly eventful. He was a precocious youth; his cleverness soon made its mark, and his life was devoted to his historical studies and literary work.

studies and literary work.

Michelet will always be best known by his History of France.
In the History of the French Revolution his characteristic defects are more apparent and his good qualities less strongly marked.

M. Taine has called Mr. Carlyle the English Michelet, but the comparison is only partially borne out. Among modern historians Carlyle, Macaulay, and Michelet may be classed together as endeavouring to convey, not merely the hard dry facts of history, but vivid impressions of the actual course of events and of the people who played a prominent part in them. The Englishmen, however, keep their feet on the ground; the Frenchman soars at will. Whether M. Michelet can properly be called an historian is not perhaps a very profitable inquiry. It is a mere question of words and turns on what is meant by an historian. He tells us that when he sat down to his History of France he found that his country had annals, but that its history had yet to be written. Ensinear means and studied it event the form the religious for income Them. annals, but that its history had yet to be written. Eminent menhad studied it especially from the political point of view. No one had penetrated into the infinite detail of the various developments of its activity, religious, economical, artistic; nor had any one embraced in a general view the living unity of the natural and geographical elements which had made her what she was. Different historians had taken different points of view—some engrossed by the question of race, others by institutions, and so on, without seeing how difficult it was to keep these things apart, and how they acted and re-acted on each other. "Life," he held, "was really life only when it was complete"; and he resolved to try to make a complete and animated picture of French history. He was not content merely animated picture of French history. He was not content merely with connecting the different parts together, but he determined also to attempt what he called "the resurrection of the integral life, not only on the surface but in its deep and immer organisms."
No wise mun, he admits, would ever have thought of such a thing, but "happily, he was not wise." It is obvious that there are two ways of writing history; one way is to search out, sift, and classify the facts, leaving the render to derive from them such impressions as he is capable of forming. In the other case the reader is offered not the hard bare facts themselves, but the impressions which the study of them has produced on the writer's mind. There is no reason why the latter should not, within certain limits, be considered a proper function of the historian. There are many people to whom a string of facts conveys no ideas at all, and who would be utterly unable to conjure up a lively picture of any particular incident or period without assistance. It is evident, however, that this second kind of history must necessarily be taken very much on trust, and that there is a point at which it becomes exceedingly difficult, if not impossible, to distinguish between solid fact and pure imagination. Carlyle and Macaulay both endeavour to realize characters and incidents vividly for the benefit of their readers, but still they adhere pretty closely to the narrative for and their historical pudding is full of plums—that is to say, fa and their historical pudding is full of plums—that is to say, facts. They give you not only their impressions, but the evidence on which those impressions rest. Michelet, on the other hand, does not bind himself down to the order of narrative, and his facts are usually presented in a highly sublimated form. His History is usuadoubtedly a work of great historical value, and any one who wishes a male of the order of Ferral historical value, and any one who wishes to make a thorough study of French history is bound to read and will probably get much more from it than from many as h torical compilation of the ordinary kind. Nevertheless, it certainly not a History in the common sense of the word. It certainly not a History in the common sense of the word. It is rather a series of essays, or perhaps one might say poems, setting forth views and speculations as to different periods of French history. When M. Michelet sets himself to work out the resurrection of the inner and secret life of any historical pursuage, he is really exercising the novelist's art, and the result is 'bit of fiction. It does not follow that the flation may not beginned, but its truth is poetical and imaginative. It may be impossible to buy down a precise rule as to how far an historical seasy shall go in this direction, was it is easy to mulessand thus, he can see but any but a down a precise rule as to how far an historian may hitly go in this direction, yet it is easy to understand that he care go but a very little way. The substance of history main, after all, he facts, things which are capable of some sort of proof; and the historian

must here to the ground. When he takes to the air he becomes a newdist of post.

A very good ensemble of Michelet's way of treating history will be found in the volume devoted to Louis XIV. He was been with a pions has all of Mings, which he barefully charished. He bosses that his history is an exposure of "dieux crevés, role pourris," and that he has executed a severe autopsy on this "government of corpses." It may be imagined, therefore, how he ninelse Louis XIV. to pieces, and with what delight he shows up the history and shallbiness of the idel under its golden mantle. There is fillenty of scope for this, no doubt, but Michelet pushes it to an extravagant length. His favourite authority is the register of the King's health from his boyhood to his death which was kept by the royal physicians. It is extremely minute and uncompromising in its details. The doctors probably thought that the subject was too soldism for equivocations or pretty phrases; and they certainly set down everything plainly enough. Michelet is in reptures with their "intropid positivism"; and it cannot be said that here he has not facts to go upon. But observe what use he maires of the facts. He takes all the principal events of the reign, and males out a sort of account in double of the reign, and males out a sort of account in double of the reign, and males out a sort of account in double of the reign, and males out a sort of account in double of the reign, and males out a sort of account in double of the reign and males out a sort of account in double of the reign and males out a sort of account in double of the reign and males out a sort of account in double of the reign and males out a sort of account in double of the reign and males out a sort of account in double of the reign and males out a sort of account in double of the reign and males out a sort of account in double of the reign and males out a sort of account in double of the reign and males out a sort of account in double of the facts. of the reign, and makes out a sort of account in double columns, one side giving the event, and the other the King's particular state of health at the moment. Now he has a colic, and that accounts for such a thing; another time he is overesting himself, drinking too much strong Burgundy, and scandal-ously running after Maids of Honour, and that explains such another thing. Or again he is brought low with bleeding and aimilar remedies, and here we get at the source of something else. We do not happen to have the volume before us, and write from We do not happen to have the volume before us, and write from memory, but this is its general tenor. The history of the country is reduced to a study of the monarch oscillating between his doctors and his mistresses, and of course a great deal is made of a famous surgical operation. It will readily be understood that the most august divinity must look very small when subjected to this extremely private investigation; but no doubt Louis XIV. is fair game. It is also true that it is the curse of personal government that it should hear the most of personal weakenesses and given that there game. It is also true that it is the curse of personal government that it should bear the mark of personal weaknesses and vices; but there is surely something ludicrous in the strain which Michelet puts on all sorts of trivial incidents of this kind, and the keenness with which he hunts a grave piece of State policy to its origin in a pot of jalap, an extra cup of wine, or the surgeon's lancet. We might take other parts of the History and point out other examples of the same sort of thing. It runs through the whole work. Micholet has been rather unfairly called a superficial writer. He was evidently a man of much research and extensive reading, and it would seem a man of much research and extensive reading, and it would seem that he worked hard in the collection of materials. He is not superficial, but he is fanciful and fantastic. He builds up the most gigantic framework of argument on some petty circumstance in which his eyes discover what everybody else is blind to. Any one who chooses to stare at the clouds or brood over the fire may see some wonderful sights; and there is, on the whole, rather too much of this brooding fance in Michelat's History. Vet it is much of this brooding fancy in Michelet's History. an extremely interesting and suggestive work, and should certainly not be omitted from the library of any student of history who wants ideas as well as dates. "My life," the author used to say, "is in that book; it passed into it. It is my only event. I made it, and it has made me."

THE LATEST SCHEME OF SWISS FEDERAL REFORM.

Swiss affairs have of late drawn to themselves a much larger share than usual of the attention of Europe. But they have been almost wholly affairs which in themselves concern only par-ticular Cantons, and which touch the Confederation only in case of an appeal being made to the Federal power against the acts of the Cantonal governments. The expulsion of Bishop Mermillod the Cantonal governments. The expulsion of Bishop Mermillod was a Federal act; but the dispute which has been going on about the Catholic parishes in the Jura—that is, in the old Bishopric of Basel—is in itself a matter which touches only the Canton of Bern. But from the odd phrases which have been used in the English papers—talk for instance about a hitherto unknown body spoken of as the "Swiss Grand Council"—it would seem that people are still unable to understand, in Europe at least, the relations between a Federal commonwealth and its members. The same people would most likely be ashamed of confounding the State of New York with the United States; but then people do not go to America to climb Alpa. But while the Cantons do not go to America to climb Alpa. But while the Cantons have been acting, the Confederation has been acting too, though to the action of the whole the world has not given the same attention which it has given to the action of the parts. And the two have to some extent been acting on the manner matters. That is to say, the exclesisation controversy which has been going on at the same time on the relation of the points in discussion in the two Houses of the Federal Constitution. Several Amendy have a direct bearing on sometime on the relation to remember that the bedy which has been discussing and passing successistical changes in the whole Confederation in the Confederation will go, along with heady which has been discussing and passing successistical changes in the whole Confederation is not the same being on any of its Cantons is there any body known by the Notional-like any of the Swing Grand Counted.

The two Houses of the Federal Amenday have been helding a which has been discussing and passing successistical changes in the whole Confederation is not the same any others, to the vote of the Cantons not their own. We will not you have any of its Cantons is there any body known by the same of the Swing Grand Counted.

The two Houses of the Federal Amenday have been helding a which has been discussing and passing successistical changes in the whole Confederation is not the same any body known by the proper of the Cantons not their own. We will not you have a point to be noticed in Cantons not their own. We will not you have a point to be noticed in Cantons not their own. We will not you have a point to be noticed in the old question of the Nector-like Swing Cannot are any body known by the proper of the Swing Grand Counted.

The two Houses of the Federal Amenday have been helding and proper of the Swing Grand Counted and the proper of the Swing

January, and they have again put into shape a scheme for the revision of the Federal Constitution. New proposals have after January, and they have again put into shape a scheme for the Pervision of the Federal Constitution. New proposals have, after various amendments, passed both Houses, and they now await the vote of the Cantons and of the people. We are easily to see that it has been again decided that the voting should be in globs, that is to say, that the whole scheme shall be put to a single vote of Yes or Nay. The objections to this course are not so strong now as they were to the scheme which was thrown out both by the Cantons and by the nearly in Nay 1872. It is plain that now as they were to the scheme which was thrown our men my the Cantons and by the people in May 1872. It is plain that during these last delates a spirit of reconciliation has been as work which has brought all parties nearer to a common point than they were in the delates of two years ago. One must striking fact is that the representatives, not only of Bern and Zurich, but of Geneva and Vand, Dr. Inde smong the latter, are now in favour of the revision, at least as a whole. It should of course be remainof Geneva and Vand, 1r. Ithis among the latter, are now is favour of the revision, at least as a whole. It should of course be remainsbared, as we showed once before while speaking of the last Foderal election, that the influences which direct the choice of representatives, and thereby the acts of the representatives when they are elected, are not siways the same as those which direct the "Yea" or "Nay" on a popular vote. When a proposal is objected to by different parties on different grounds, it is quite possible that a constituency may send up representatives favourable to a scheme, and may yet in the end reject that scheme when it cames to it for a single vote of "Yea" or "Nay." Still the change is most remarkable. Within the walls of the Federal Palace at least, the vahamant conscition of the Romance Cantons seems to have come vehament opposition of the Romance Cantons seems to have come pretty well to an end. Their great bugbear, the four of being dragooned into a common system of German Law, has been taken The main stress of opposition now comes from the small Catholic Cantons; and they, we cannot but think, have a real reason to complain. But all this greatly changes the position of things from what it was in 1872. There is now much less chance than there then was of a strong and successful opposition, formed through the momentary union of several parties which have little or nothing in common among themselves, but each of which objected to some part or other of the proposed changes. Still we must think it not only unwise, but unfair in itself, to ask for a single vote on a long string of proposals on various subjects which have no necessary connexion with one suother. A man ought not to be asked to vote for a military proposal which he dislikes because there is no other means of carrying an occlosinstical proposal which he wishes for. This, or semathing to the same effect, is what it really comes to when the popular vote is taken is ylobe on the whole scheme. We should have thought it odd here if men were asked to give a single vote of Yea or Nay about the disestablishment of the Irish Church, the abolition of purchase in the army, and the 25th Clause in the Education Act.

We will now speak of some of the more important features of the new scheme, and especially of the points on which the two Houses at first came to different conclusions, but have since come to an agreement by accepting one enother's amendments.

In the matter of education, it may be remembered that the existing Constitution simply gives the Confederation power to found a Polytechnic School, which has been done, and a Federal University, which has not been done. Beyond these two permissive clauses education is left to be wholly a cantonal affair. The new scheme proposes to give the Confederation power to found other institutions for superior education. To this the National rath other institutions for superior education. To this the Nationalrath proposed to add a power to give help to ("subventionner") institutions of the same nature. It also proposed to give the Confederation power to lay down rules and conditions for the management of primary schools, though the nanegement itself was to be left in the hands of the Cantons. The biunderath left out the power of subvention; and instead of a Federal power of laying down regulations for schools, it simply proposed to vest in the Confederation the right of seeing that constitutional provisions were really carried out. Among these, as the proposal now stands, are that primary education is to be placed under the exclusive control of the civil power; that it is to be compulsory, and in all public schools gratuitous; coupled with the following very im-portant provision, however hard it may be to carry it out in

Cos écoles publiques doivent pouveir être frequentées par les adhécents de tentes les confessions, sans avoir à souffrir d'aucune façon dans leur liberté de conscience ou de croyance.

One or two curious points came out in the debates on this subject. One or two curious points came out in the debates on this subject. One orator, for instance, wished for a clause making "Forest ment civique" obligatory in all primary schools. For, as is said, many young men, when they were called on to enter on their military duties, were found to know nothing of the constitution either of the Confederation or of their own Cantons. We have often found the same kind of ignorance at house, and that not

scholar or citizen, has any right in Port Meadow unless he had freeman by birth or otherwise, the thing is little more than an odd local survival; but it would become important if every perfeir in England had such a body of freemen possessed of valuable odd local survival; but it would become important if every partial, in England had such a body of freemen possessed of valuable corporate property. This difficulty there seems no way of getting over, except by measures which would be reckened violent in any part of the world. On other points something is gained by giving the newly-settled µiroso; a vote after three months' residence, instead of leaving it open to his new Canton to disfranches him for two years. Some also of the certificates formerly necessary for settlement in another Canton—the vague certificate of good morals for instance—are abolished; though the "acta d'origine on autre pièce analogue," which seems so odd to an Englishman accustomed to settle where he will without being asked any questions, is still kept on.

Just now whatever bears on ecclesiastical questions has a special interest. A remarkable debate arose on a clause which the Nationalrath inserted and which the Ständerath struck out, by which the Cantons and the Confederation were authorized, besides which the Cantons and the Confederation were authorized, besides their old power of keeping the peace between contending religious denominations, to act in a way which is described in the words "prendre les mesures nécessaires contre les empiètements réciproques du domaine civil et du domaine religieux." In the end the clause was adopted by both Houses in this form:—"Contre les empiètements des cautofités restrictions in the contraction de la cautofité de la cau ments des autorités ecclésiastiques sur les droits des citoyens et de l'état." New articles forbid the foundation of new or the restoration of suppressed monasteries, and the erection of bishoprics on Swiss territory without the approval of the Confederation. The old Article 44, which guaranteed freedom of worship to all recognized Christian confessions, has now become Article 49, and in its new form it is in one way wider and in another narrower. It used to stand thus. to stand thus:-

Le libre exercice du culte des confessions chrétiennes reconnues est aranti dans toute la confédération.

In its new form it stands thus:-

Le libre exercice des cultes est garanti dans les limites compatibles avec l'ordre public et les bonnes mœurs.

One new Article, which decrees the abolition of "ecclesiastical jurisdiction," is not, to an Englishman, very clear. We also get provisions that no one shall be in any way constrained or suffer in any way on account of his religious opinions, and that no one can on the ground of his religious opinions absolve himself from any civic duty. One of the ecclesiastical provisions of the National-rath has been modified by the Stünderath. As proposed it stood thus:—

Nul n'est tenu de payer des impôts dont le produit est affecté aux frais du culte d'une confession ou d'une communauté religieuse à laquelle il n'apparisent pas.

This, it was argued, would, in a Canton which has an Established Church and a clergy paid by the State, justify a Dissenter in refusing to pay any taxes at all. The first words were therefore altered into the following form:—

Nul n'est tenu de payer des impôts dont le produit est spécialement affecté aux frais proprement dits du culte d'une communauté religieuse à laquelle il n'appartient pus."

A proposal of the Nationalrath to make Sunday a day of rest by an A proposal of the Nationalrath to make Sunday a day of rest by an Article in the Federal Constitution has been thrown out by the Ständerath. In some of these pieces of legislation we certainly see signs of a spirit which, in opposing intolerance, itself becomes intolerant, and which seems to overstep the range of subjects proper to a Federal Constitution. But this, we suppose, is the necessary consequence of new Councils, new dogmas, and a generally defiant spirit which arrays the feeling of makind against itself. The reaction is natural. Yet of all policies the worst is that which makes martyrs, or does anything which can be construed into the making of martyrs. In all these questions we never fail to think of the two opposite sayings attributed to James the Second and William the Third:—"Mr. Johnson has the spirit of a martyr, and it is fit that he should be one." "Mr. Collier has set his heart on being a that he should be one." "Mr. Collier has set his heart martyr, and I have set my heart on disappointing him."

In strictly constitutional matters it is a comfort to hear no more of the *Initiative*, while the *Referendum*, the appeal from the Federal Chambers to a vote of the people, appears only in its "facultative form," when it shall be demanded by a fixed number of Cantons or of citizens. We still cannot bring ourselves to swallow the Referendum in any shape, and we do not forget the argument used with much force in the former debates, that a necessary Referendum might become almost a matter of form, while in its "facultative" shape it is an invitation to agitate against a law the moment it is passed. On the other hand the new provisions with regard to the Foderal Court are a decided gain. Its powers with regard to the class of appeals which are now so absurdly brought before the Federal Coupail and the Federal Assembly will be largely increased. And whereas by the present Constitution the members of the Court are elected by the Assembly for three years, the new Con-Court are elected by the Assembly for three years, the new Constitution leaves this point open. The number of the Judges and the term of their functions are to be fixed by a Federal law. It is therefore possible that the term may be for life; though we still think that they should not be chosen by the Assembly.

These are only some chosen points out of many which are dealt with in the new scheme. Had we a vote in the matter, there are many points in it for which we should heartly give that vote, but we should at least have to think twice before we could say Ju to the whole scheme.

Ju to the whole scheme.

47

PARASITES OF THE PRESS.

CASE which has this week been tried in the Court of Queen's Land. Bench brings out very clearly some of the difficulties of managing a newspaper with a great name and a numerous and widely-scattered staff of contributors. Soon after the fall of the Commune an unpleasant story began to be circulated in reference to a supposed Correspondent of the Times who was accused of having obtained a commission from M. Thiers to save what papers and valuables he could from M. Thiers's house in Paria, and of having afterwards endeavoured to extort a large sum, as money for the surrender of certain documents which had thus come into his hands, and which were said to be of a compromising character. At first this story was directed against Mr. T. G. Howles, who happened to be in Paris as the Correspondent, not of the Times, but of another London paper. Mr. Bowles at once wrote to M. Barthélemy St.-Hilaire on the subject, and M. St.-Hilaire replied that the story was true, with the exception that the papers to M. Barthélemy St.-Hilaire on the subject, and M. St.-Hilaire replied that the story was true, with the exception that the papers were worthless and that the Correspondent's name was not Bowles but Polhès. As nobody of the name of Polhès had ever been heard of at the Times office, it was natural that he should be denounced as an impostor; and this was done in a letter written by one of the genuine Correspondents of that journal as a means of extricating himself and his colleagues from the suspicions which surrounded them. It turns out, however, that M. Polhès, though not a Correspondent of the Times, and quite unknown to the regular staff of the paper, was for a short time employed to pick up scraps of news for the Correspondent of another English newspaper who also sent occasional letters to the Times, and that M. Polhès, on the strength of this connexion, had assumed that he was entitled to describe himself as the secretary of the Correspon-M. Polhès, on the strength of this connexion, had assumed that he was entitled to describe himself as the secretary of the Correspondent of the Times. A French statesman may perhaps be pardoned for not appreciating the delicate distinction between a Correspondent and the secretary of a Correspondent. It is quite clear that M. Thiers and M. St.-Hilliare received M. Polhès as an agent of the Times, and M. St.-Hilaire received M. Polhès as an agent of the Times, and that they were thus induced to place confidence in him. It does not follow, however, that M. Polhès may not have been scrupulously careful in designating himself correctly according to his own conception of his relations with Printing House Square; and as he has obtained a verdict in his favour, it is evident that the jury took this view of the matter. A question was raised as to whether a writer who sent only casual letters to the Times could be regarded in the technical sense as one of its Correpondents, but of course M. Polhès may not have been aware of the niceties of English distinctions on this point.

We have referred to this case, not for the purpose of discussing it in any way, but merely as an illustration of one of the difficulties of journalism. It appears that the Times Correspondent in Paris who felt bound to expose what he took to be a case of imposture had formerly been attached to the Abyssinian Expedition in the

had formerly been attached to the Abyssinian Expedition in the service of the same journal, and had, even on the distant plain of Zoola, been confronted with a gentleman who had contrived to obtain a footing in the camp by passing himself off as the Correspondent of the *Times*. The man who has lost his shadow is certainly less to be pitied than the man who is perpetually haunted by one which does not belong to him, and which occasionally succeeds in getting before instead of behind him, and appropriating the privileges to which he is entitled. It is not merely that the sham Corresponwhich he is entitled. It is not merely that the sham Correspondents discredit and disgrace the real ones, but that they often put the latter in the position of being suspected to be shams. Some exasperation on this account is surely very natural. The trick, it seems, is played more or less everywhere, but it is probably more common in France and in the adjoining countries than anywhere else. It may be taken as a rule that at any moment there is always in some part of the Continent a sham Correspondent trying to swindle an hotel-keeper or to obtain a favour from an official on the strength of an alleged connexion with the Times. Anybody who has travelled much must have heard many stories of this kind, and may possibly have witnessed the detection of one of these impostors. They infest the table-d'hôte; they establish themselves in free quarters at fashionable d'hôte; they establish themselves in free quarters at fashionable dhild: they establish themselves in free quarters at fashionable watering-places, on the pretext of writing them up and making them more famous; they levy black mail on petty innkeepers in obscure nooks as the price of bringing the grands route, with its rush of Milors, round that way; in a manufacturing town they promise an inundation of English buyers. The wine districts are a favourita hunting-ground of rogues of this class. Most commonly the sham Correspondent is content with his food and ledwing gratia and is huntile around to except a glass of with respect lodging gratis, and is humble enough to accept a glass of wine or even schnapps rather than nothing; but the more audacious mem-bers of the profession demand, and sometimes obtain, considerable sums of money. The writer of the letter with reference to M. Polhès, said he thought it very hard that official persons should receive with said he thought it very hard that official personsehould receive with open arms any chance comer who chose to say that he was connected with the Times, without inquiring into the precise nature of the connexion, or asking him to produce his credentials. There can be no doubt that the confidence of officials is often singularly misplaced, and that more circumspection may be expected from them than from ignorant innkeepers and tradestion. It is probable, however, that the game will still be kept un marrily. The fact is that the Times has obtained a remarkable field upon the imagination of foreigners, and this is one of the consequences of this sort of greatness. Their ideas of the magnificency of the Lord Mayor are equalled only by their ideas of the stapendous machinery by which the Times collects news, and especially all sorts of Court socrets, in foreign parts. Not long upon we read in

The mine accepted spot and thinks being perfectly better the world. The result is a lies of all the subjects which by any change are likely to occupy public attention to the subjects which hy any change are likely to occupy public attention in the provided with a bundle of blank chaques for his subject, and previded with a bundle of blank chaques for his subject, and previded with a bundle of blank chaques for the measure enviling seems quiet and humdrum, but where an origin environment. One betakes himself to the heart of Africa, another to Centra lana, who knows more about it than anybody else; perhaps the only man who knows more about it than anybody else; perhaps the only man who knows anything about it. Besides this, there are always four or five Correspondents, with packed portmanteaus and the usual stock of blank cheques, waiting in Printing House Square ready to be started at a moment's notice to China or Peru. The evidence given in this trial shows us how the work is actually done. The Times has a number of regular and duly accredited Correspondents in different parts of the world, who are entitled to use its name and to collect information on its behalf. It also sends out special Correspondents as occasion arises for their services. But besides this, it receives a vast quantity of volunteered communications from all sorts of people, who are paid for their contributions if any use is made of them. Taken literally, a Correspondent is a person who sends correspondence; and we suspect that the nice distinctions between "Our Own," "Our Special," and "Our Occasional" Correspondent are rather thrown sway upon the general public. The reputation and liberality of on important journal will always attract towards it a vast quantity of correspondence from all sorts of people; but the penalty is that many of those who have thus furnished casual assistance are apt to give themselves out as recognized agents, while perhaps a still larger number of persons who never had anything whatever to do with the paper go about

It is the peculiarity of the press that it is a profession which is usually followed without any personal identification. The writers are known to their employes, and they are also known within a limited professional circle. Beyond that their names have probably never been heard. The consequence is that it is very easy for persons who choose to do so to pretend to be connected with journalism in some form or other, although they may never have written a line for a newspaper in their lives, and may be quite incapable of doing so. There are at this moment in London a capable of doing se. There are at this moment in London a considerable number of people who obtain free admission to theatres, concerts, and all sorts of places of amusement, who thrust themselves into public dinners and forage among the restaurants, who lavy contributions from trade-smen, extract bribes from specularity appearance and in short curve on a general system of mendilative companies, and, in short, carry on a general system of mendicancy and extortion on the strength of a connexion with some newspaper or other which in nine cases out of ten is probably purely imaginary. There are journals which are kept up for no other purpose than as a pretext for this sort of black mail—journals without credit or circulation, but which represent merely paper and printing that can be passed off on the foolish and unwary as a much public capition. so much public opinion. The worst examples of this imposture are perhaps to be found among what are called financial papers.
Some of the Indian princes who have from time to time appeared with claims against the British Government could probably throw a good deal of light on the manufacture of opinion to order in a certain class of papers; and exhibitors at the great Exhibitions in a certain class of papers; and exhibitors at the great Exhibitions in London, Paris, and elsewhere, eager for a puffing notice of their wares, could also disclose the prices at which they purchased, or thought they purchased, fame. There is, in fact no great institution which is so discredited, disgraced, and preyed upon by parasites of all kinds as the newspaper press. To some extent perhaps the consequence of the press are themselves responsible for this evil, in consequence of the carelessness of some of them as to the personal character of those whom they employ. It is true that in arrays consequence of the carelessness of some of them as to the personal character of those whom they employ. It is true that in every profession there are black sheep; but the privacy with which must newspaper work is performed unfortunately supplies a cover under which black sheep have sometimes rather more than a fair chance. The public, however, might do a great deal, not only to protect themselves against imposition, but to keep up the character of the press, if they would only believe the sham Convented only believe the sham the character of the press, if they would only believe the sham the character of the press, if they would only believe the sham the character of the press, if they would only believe the sham the character of the press of the pressure that the sham the character of the pressure that the sham the pressure that the sham the character of the pressure that the sham the character of the pressure that the sham tha Companies to effect the objects for which they seek to be paid, and if they would treat as impostors all who offer their services for him, as manufacturers of public opinion.

HOURS OF POLLING.

I There not been too far reduced. A resident in Lembeth or Chicken, who has employment in the City from nine to four delty, ment vote in the three hour of politing if he votes at all. There is no doubt more danger of disorder after dark, but there is no reason with the political about not be opinish at all or seven in the manning and perhaps hept open a little later at night, particularly where the country of the votes to not begun until much

light open different days, and there was only one pulling-place even for the great dounty of York. The time was monimizedy limited to nine days, two days, and one day, and increased convincions for taking the noll were provided. As regarded horotophes, the existing law in that the polling shalk begin as sight ordicals in the forescon, and shall continue during one day only, and no poll shall be kept open later than four ordical in the attention. But suppose that the poll is not opened until after night ordical, or is closed before four ordicals, what is the effect upon the station? This question seems likely to be raised in connexion with one or more of the elections in metropolitan boroughs. In Hackney it appears that three of the polling-stations remained closed throughout the day, while in Lambeth it is stated that several polling-stations were not opened at the proper time. As regards Hackney, it can hardly be doubted that the election will be declared void. An elector can only vote at the station appointed for him, and if that station be not opened he is deprived of his vote. There were nineteen polling-booths or stations in Hackney, and if three of the stations remained closed throughout the day, something like one-sixth of the constituency would be for the time disfranchised. An election thus conducted can hardly be supposed to be valid; but if we inquire what degree of irregularity in procedure will invalidate an election the answer may be difficult. Under the old practice of keeping open the poll several days there was ample opportunity to vote, and irregularities in the hours of opening and closing did not greatly matter. But suppose that a City clerk who lives in Lambeth goes to his proper polling-station at halfpast eight on his way to business, and it is not open, and his vote is lost, and suppose this occurs in numerous cases, the grevance becomes serious. A slight want of punctuality in opening one or two booths would not furnish a case for interference. The entire failure to open three booth wou

Non-compliance with the rules of ...e Ballot Act will not invalidate an election if it appears that the election was conducted in coordance with the principles of the Act, and that such non-od apliance did not affect the result of the election. This is the substance of a clause in the Ballot Act, which, however, is not directly applicable to the question under consideration, beginse that question arises, not upon the Ballot Act, but upon makes, or rather part of a clause, of an earlier Act which is the unrepealed. It seems useless to complain of the slovenly beaut of modern legislation. Instead of repealing the whole of the Act limiting the hours of polling and re-enacting part of it, Parliament has chosen to repeal part of a section of that Act and leave the rest standing. Thus, if we want to know on what day a poll should be taken, we must refer to the Ballot Act; but if we want to know during what hours the poll should be kept open, we must refer to the earlier Act. The mutilated section of the earlier Act which remains unrepealed speaks of "such one day," but the antecedent of "such" has been swept away. However, we understand it to mean the day appointed under the Ballot Act for taking the poll. Thus the law is:—

(r) The polling shall commence at 8 A.M.
(a) It shall continue during one day only.
(3) It shall not be kept open later than 4 P.M.

What is the effect of non-compliance with these enactments? Are they merely "directory," as lawyers say, or are they "imperative"? If they are "imperative," non-compliance with any one of them would invalidate the election. But the practice of Parliamentary Committees appears to have been to inquire whether "the result of the election" was affected by non-compliance with these enactments, and only to invalidate the election where this appeared to have been the case. Thus Committees proceeded on the view which has been adopted in the Hallot Act. They looked to see whether the result of the election had been affected, and probably they would also have considered whether the "principles" of election law had been violated; but it appears to be a matter of doubt, and certainly of importance, what the true interpretation would be held to be of the words "whether the result of the election has been affected." In the Hackney case it is impossible to say what the result of the election might have been if the voters had had full opportunity of polling. But we may say with something like confidence that "principles" have been set at nought. It clearly is a "principle" that electors should have reasonable opportunity of voting, and this they do not get if they are teld off to a particular polling-booth which remains closed throughout the day. In considering the case of Lambeth we will assume that a hundred voters were actually prevented from voting by the delay in opening the poll. These voters would have just ground of complaint; but we are not sure that a judge could see prevailed upon to avoid the election on this ground. If it could be shown, not with certainty, but with reasonable probability, that a number of votes were lost to the defeated candidate which would have placed him in a majority, that would be a very different case; though even here it must not be forgotten that, where a petition is at the suit of any of the electors themselves, the question whether the fortune of either of the candidates has been influe

decision was due to the circumstances of the case. The decisions of Committees are not likely to have much weight with the judges by whom elections are new tried, and therefore it may be useful to see whether any decisions have been given by judges which throw light upon this question.

throw light upon this question.

In the Warrington case it was alleged that, in consequence of confusion at a polling-booth, and owing to the incompetency of a poll-clerk, the electors had by no fault of their own been prevented from exercising their franchise freely and indifferently, and that therefore the election ought to be held void. It was proved that at one of the polling-booths, upon the resignation of another man, a person named Dickson was appointed to be poll-clerk. Dickson went to the polling-booth, and took his seat at first in a place which was not the usual place for the poll-clerk to sit at, but he was afterwards removed by the Returning Officer to a better place. The persons who went to vote, instead of going in steadily one by one, rushed up in a crowd in frent of the place where Dickson was sitting, and, instead of orally tendering their votes, they held up tickets for him to take, and then thrust them over on to his book. Some of these tickets were taken in by a man named Lowe, a check-clerk of one of the candidates, who was sitting in the booth. check-clerk of one of the candidates, who was sitting in the booth, and by him handed on to Dickson, without any personal tender of the vote being made to Dickson by the voter himself. Partly owing to this rush of persons, and partly also in consequence of Dickson not turning out to be a very competent man, there was a confusion at this polling-booth for an hour or so, and the votes of a number of persons were either not recorded at all or Dickson not turning our so that an hour or so, and the votes confusion at this polling-booth for an hour or so, and the votes of a number of persons were either not recorded at all or wrongly recorded. On these fasts it was contended that it was the duty of the Returning Officer to take care, as each voter came up, that he tendered his vote to the right person, otherwise that voter would not have that free opportunity of exercising his privilege to which he was entitled. The question was whether the electors had been deprived, not by their own wrong, of the privilege of voting. Mr. Baron The question was whether the electors had been deprived, nor by their own wrong, of the privilege of voting. Mr. Baron Martin held that this was not a void election. He did not consider that it was entirely through the fault of the poll-clerk Dickson that the poll was not properly taken. He thought that Lowe and the voters, as well as Dickson, were parties to the irregularity that took place. Then was this to be declared a void lattice. Lowe and the voters, as well as Dickson, were parties to the irregularity that took place. Then was this to be declared a void election? "Supposing to happened that the votes of half-adors out of two or three thousand voters are unitted to be taken, are all the other votes to be set aside, and the election declared void?" It would in his opinion be ridiculous to say that because at one booth there was in irregularity, the whole of the rest of the borough should be put to the trouble of a new election, and all that had taken place be declared null and void. "I adhera," he said, "to what Mr. Justice Willes said at Lichfield, that a judge to upset an election ought to be satisfied beyond all that a judge to upset an election ought to be satisfied beyond all doubt that the election was void, and that the return of a member was a serious matter, and not to be lightly set aside." In the Greenock case it was alleged that the Sheriff had contravened cortain statutory provisions as to dividing the burgh into districts, and assigning the voters to polling-places; but there was no evidence to show that the fairness or the result of the election was at Barcaple upon this said, "I think that these statutory provisions are of such a kind that it would require that something much more should be made out than merely that they were transgressed in good faith without any serious consequence to invalidate the

In the Harwich case, which came before a Committee in 1851, it appeared from the evidence that a voter named Woods went to the poll four or five minutes before four o'clock; that the Iteturning Officer was there with the clarks and poll-books; that the witness tendered his vote for the defeated candidate; and that while the poll-clerk was writing down his name a disturbance took place, and the proceedings were interrupted by the mob, who, in accordance with a local custom, considered themselves antitled to the hustings with a local custom, considered themselves entitled to the nustring when the poll was closed; that during some discussion as to administering the bribery eath, a cry was raised that "Time is up"; that the hustings were speedily demolished; that the Mayor refused to take the vote, and that the poll was finally closed before four o'clock in the afternoon. It was contended that the poll was improperly and unlawfully closed, that the proceedings were interrupted by violence, that the Returning Officer ought not to have finally closed the poll, but was bound by law to have adjourned the same and that on both these grounds the election was void. the same, and that ou both these grounds the election was void. The majority was six, and only this one case of Woods was brought forward. Evidence was given on behalf of the sitting member to forward. Evidence was given on behalf of the sitting member to show that the poll was not closed before four o'clock. The Committee resolved that the poll was closed before four o'clock; that the proceedings were interrupted by violence; that, in consequence of gitch interruption, Woods was prevented from voting; that the effection was void; and that the Returning Officer should not finally have closed the poll. This case, therefore, went upon two grounds, and it cannot be regarded as a clear authority that the closing of the poll five minutes before four o'clock would avoid the election.

Where a statute directed an act to be done in a certain manner, and it was not so done, the act was not held would unless the statute went on to direct that it should be so. Thus an order of justices at the Michaelman Quarter Sessions was held walld, although the Bessions were not held in the first week affect the 11th of Citober, as they were directed to be by statutes. Heavy cases have held and active on this principle that the parties were

mords are necessarily importance, but it would be seemful infection, but that affirmative words are not importance. There when the seems says that the poll shall commence at eight o'clock, and shall not be kept open after four o'clock, it can hardly be that a difficunt rule construction would be applied to these two clauses of the seem section. Within limits it may be safely said that this whole section is imperative. Thus if the Returning Officer were to give notice that he should hold the poll from nine to five o'clock, there are be little doubt the election would be void. But it would be seen to be little doubt the election would be void. But it would be put cases of accidental and partial infringement of the Act the decision would be doubtful. Thus much, however, is cla that either the hours of polling ought to be extended, or very complete arrangements ought to be made for taking the poll wife out delay to voters. Such occurrences as those of Hackney and Lamboth cannot but cause deep dissatisfaction.

AMERICAN AND ENGLISH THEATBES.

RECENT number of the New York Harald contains at A bearing the title "American Comedy—Is it Coming?"
answer given to this question is such as one would have expense. Poor as this country is in current dramatic literature, she is rich in comparison with America. "Nobody will write an American play," except, we may remark, Sardou, who does not exactly please. American taste. A few years ago a drama was brought out which was popularly accepted as an American play. "It was merely a very literal piece of realism, with a cosmopolite series of dramatic persones, and the scenes adroitly laid near the Rocky Mountains." But in order to produce "a contemporansous comedy" it is necessary to do something more than provide "portraits of places, furniture of the period, and vivilication of fashion plates." The dramatist who is master of his art is not content with investand the dramatist who is master of his art is not content with investing every territorial settler with the moral proportions of a hero-albeit a hectoring hero—and uniting highly improbable incidents to one another by wholly impossible links. His incidents would grow out of his characters, and his characters would develop from his incidents just as they do in real life. "When the truly American comedy comes along, we shall entertain no objection to its having just as many bandsome dresses for the leading lady as that somewhat exacting personage could desire, provided that it is not necessary for the management to depend upon the handsome dresses for the success of the play, and provided the accessories are not made to occupy so large a space in the public eye that the essentials are lost sight of." This passage puts the matter very forcibly, and we will only add that, "when the truly American comedy comes along," we hope to be in the way of meeting it. As might be expected, American managers are even more destitute of good literary assistance than we are, and they endeavour to supply this want of talent by providing everything that money can buy. We might be quite sure that, if a good play were produced in America, it would be brought to England, but nothing of the kind has come. And it is tolerably certain that Americans would not America, it would be brought to England, but nothing of the kind has come. And it is tolerably certain that Americans would not be content with that dreary entertainment called a lecture if they could get anything better. "We want a comedy deriving its elements from civilization in the United States, and limiting its electicism to what is generically American." One writer who has attempted to satisfy this demand has produced "cheap dramatic ferrotypes of life in concert-saloons and slums." Another writer localizes English scenes and characters by help of a novel of Trollope; or he assimilates the "Buffalo Bill" element, and fixes his scene on the border of Western civilization. Another writer "concorts a farce in five acts, which yield a number of pretty concocts a farce in five acts, which yield a number of pretty women the opportunity of wearing stylish dresses, and render it women the opportunity of wearing stylish dresses, and render necessary for upholsterers and cabinet-makers to do their work brilliantly, and give plenty of it." But these efforts do not satisfy a reasonable demand and the article exhorts young writers to set to work and produce that play which most young writers fassy they could produce so easily. But it must be something American; indigenous, no dimsy translation from a French play, no unaccredited adaptation from an English novel. "We should not object somuch to the dry-goods drams, if it were leavened with American

much to the dry-goods drama, if it were leavened with Asserican character and genuine wit."

Turning to the musical and dramatic intelligence of the same journal, we find that a play founded on the Lost of the Molecone is in preparation at Niblo's Garden. "The managers claim, we believe, that it is the American drama, and we do not say that it is not." All that is insisted on is, that a play with Big Indian is it is not necessarily American. The resort of American dramatists to Cooper's novels does not perhaps bespeak greater powerty than the reproduction of Amy Robsert at Drury Lane. But it certainly does not indicate wealth. Perhaps if the new play succeeds at Niblo's Garden, it might be transferred to Drury Lane with real Indians to act in it. That would be, we believe, a distinct novelty, and would be likely to have a marketable value. A play called Folline has been produced at the Fifth Avenue Theatre. It is an indeptation from Sardou, but contains several allusions that are intended to give it an American air, although the Franch names of persons and places are retained. A wealthy widow could of course invest in the Northern Pamunky, and Daniel Course invest in the Northern Pamunky. And Daniel Course invest in the Routhern Pamunky. Sinch a physical line has been produced in England, but it has not a marketable but us be thinkful. Sardou's characters and situations without his language are intolously characters, and situations without his language are intolously characters, and situations. character and genuine wit."

The highest three life person an immediate their; and he edices the distribution an officer of police are stitering her apartment their and her apartment their at home when they see the play. At Wood's Museum their are being her apartment, beneauth, and conjumes are and to be prevailing features of the entertainment. The placky red-shirted heroes who do the tall talk at this house are probably the American equivalent for the British Tar who gratified our fathers by expressing noble sentiments in neutical phraseology. The critic of the Herald thinks that he ought to rejoice that these plays are no worse. "But then, if they could be worse, they probably would be." In the course of the plotting and counter-plotting between the hero and ruffan of the piece, probability is outraged and coherency is despised. Catastrophes are ensured by devices which an infant could see through, and astounding discoveries which surprise no one are perpetually being made. Sentimentalism is sandwiched with murder, and the "angel mother" business alternates with negro hreak-downs. We have not at present anything so bad as this in London, but then we might have. However, the tide of sensationalism has lately rather ebbed in London, and it is not likely to be always on the flood at New York. But the dreadful difficulty is, if you take away the plays which receive these severe and

culty is, if you take away the plays which receive these severe and just criticisms, what can you put in place of them? Although America sends us no plays, we receive from thence me valuable actors. The Lyceum Theatre has become the headsome valuable actors. quarters in England of Miss Bateman and her sister, and it has been successfully managed by Mr. Bateman, who has lately, as we are glad to observe, abandoned a system of puffing which was hardly compatible with the character of a high-class theatre. The play of Richelicus having been withdrawn, we hope that the burlesque thereof at another theatre will be discontinued, particularly as it would be rather hard to continue to paredy Mr. Gladstone after he has virtually ceased to be Prime Minister. The play of Philip, which has been produced with tolerable success at the Lyceum, is welcome as affording a change of part for Mr. Irving, and also as coming from a gentleman who, although known as a novelist, has here attempted dramatic composition for the first time. We cannot pretend to say that this play has any conspicuous merit or defect. It is well acted by Mr. Irving, Mr. Clayton, and Miss Isabel Bateman. The make-up of Mr. Clayton as an old man is commended by the critics, who handsomely allow themselves to have been deceived by it. As the newspapers divulged on Monday morning that the old man was Juan in disguise, we are unable to judge whether this secret could have been penetrated by the unaided quarters in England of Miss Bateman and her sister, and it has whether this secret could have been penetrated by the unaided sagacity of the audistice. We do not, however, think this make-up so remarkable as others which have been lately seen, and it would be rash to challenge comparison on this head with the clover firm of Trico-he et Cucolet. It is a little unfortunate that the last act of Philip, which is intended to be solemn and impressive, contains a situation resembling that which causes such exuberant mirth in the second act of the English version of Le Mariage de Figure. There is a continuant who takes refuse in a closet, there are a wife and a gentleman who takes refuge in a closet, there are a wife and a suspicious husband. Such is the levity of playgoers that the majority would probably prefer the fun of the Olympic to the moral grandeur of the Lyceum Theatre. Both plays may be seen once, but one of them will bear to be seen as often as a company can be found to act it. This comedy, like the opera on the same anhiest is ever fresh and we would recommend managers at News subject, is ever fresh, and we would recommend managers at New York to introduce the comedy as well as the opera-to their audiences. Until the American Sheridan desired by the Herald shall evolve himself from the womb of time, it may be useful to consider whether Beaumarchais could not be translated at least as well as Sardou. Beaumarchais could not be translated and a Monarchy might The political satire which was composed under a Monarchy might be adapted to a Republic. The Count might be appointed The political satire which was composed under a monarchy might perhaps be adapted to a Republic. The Count might be appointed Spanish Ambassador to the United States, and if any pedant objects that this would be an anachronism, we answer that the talents of Figare and the opportunities for their exercise belong to all times fand countries. We had almost forgotten that the story of Philip hagins in Spain; and although we believe that frockcoats and Liberal opinions have made their way into any Spanish castles which still remain, yet for the sake of stage effect it is permissible that, the Counts Philip and Juan should dress themselves like handles. Both these young men fall in love with the girl that the Counts Philip and Juan should dress themselves like bandits. Both these young men fall in love with the girl Matie, whom their mother has adopted out of charity, and whom she turns out of doors in anger at the natural consequence of her own imprudence. Poor Marie is forced to earn her living by teaching French to a family of six English children, whose parents probably overlooked the fact of her being pretty and attractive in consideration of her accepting a low salary. Afterwards she becomes companion to a French lady of fashion, and in her drawing-room meets a Seanish centerman lately restrence. Afterwards she becomes companion to a French lady of fashion, and in her drawing-room meets a Spanish gentleman lately returned with a fortuse of his own making from America, who turns out to be her did lover Philip. During the seven years that she implet French To shildren at twopence an hour she had beloure for reflection, and discovered that the faithful gloomy Philip deserved her love better than the agreeable heartless Instit is to be feared that girls often make these missakes, which semestimes they find out as grown. There had been a consistent to have killed Juan. Philip goes to America, consessions of the late of the little day.

themes to Parls, mosts Mario apple and marion has a supposes at their country house an old then who is beautiful displayed. He visits Mario when he supposes Philip to be shaut. Philip returns, and the usual jeslous husband business follows. Philip is relieved at once from suspicion and removes and husband and wife full into each other's arms, while Juan uncombrably illustrates the saying that two are company and three is now.

REVIEWS.

TALES FROM THE FJELD.

THESE are excellent stories, and they have been admirably translated by Mr. Dasent. As he says in his prefect, "things which seem essiest are often the hardest to do," and there is no small difficulty in translating, as he has done, at once with great spirit and with exact fidelity. To Mr. Asbjörnsen we, in common with all who love folk-takes, owe hearty thanks for this worthy continuation of the work which he and Mr. More began so many years ago—for the first volume of the Norske Folkerosstyr appeared as far back as the year 1842. Like many other books destined to succeed, the Norse Tales were at first received somewhat coldly. But they soon won the hearts of their readers, and they rapidly passed into enlarged editions, of which the fifth has just seen the light. In 1847 appeared a German translation, to which Ludwig Tieck contributed a preface, and in 1858 Mr. Dasent introduced them to English readers, by which Mr. Dasent has now translated, appeared in 1871. All the stories it contains were collected by Mr. Asbjörnsen, as also are those which constitute the two series of his Norske Huldre-Eccutyr, books of a song-what similar nature which we should be glad to see translated.

As we may assume that most of our readers are familiar with the first series of the "Popular Tales from the Norse," and as there is not much difference between the centents of the two collections, except in as far as, to use Mr. Dasent's words, "the character of this volume is more jocose and less poetical than that of its prodecessor," we will pass from the frank and simple stories themselves to the vexed question of their origin and meaning. Usin they be looked upon as the creation of Norwas' an peasants, or are they mere adaptations of foreign tales? To they ensurine any relics of Scandinavian heathenism, or are the fragments of myths which may be detected in them to be referred to some very different religious evatem? These are problems not easily to be solved; but although it would be rash to give any decided opinion about them, various guesses may without imprudence be hazarded. In some countries very little is known about the religious dectrines or the mythological systems of their inhabitants proviously to the introduction of Christianity. Of the deities worshipped of yere in the Slavonic lands, for instance, scarcely any trustworthy evidence exists; of the ideas which their names and attributes conveyed to the minds of their worshippers we have but little means of forming even a conjecture. But with respect to the heathen scandinavians the case is different. Thanks to poots and scholars, and above all to those friends of the luman race, as they are said to have once been officially designated, the Icalanders, we are in possession of testimony which enables us to draw sufficiently certain conclusions with respect to the roligious views entertained by the old inhabitants of Norway, the forms with which they peopled the spirit world, the voices they heard amid the howling of the blast, the sights they saw through rifts in the mist or the storm-cloud. And therefore we are in a position to judge whether the supernatural world whith was realized by the imagination of the heather.

In many cases, at least, such identification appears to be all but impossible. Every here and there, it is true, occurs a story which seems to be linked with Northern mythology, with the old tales of Asgard and Jötunheim, of the wars waged between the gods and the giants. But of most of the longer narratives it may be said that they have scarcely any features specially characteristic of the North of Europe, their plots as well as their personages being all but identical with those which are revealed by a glance at the popular fiction of the South. If we take, for example, the Sicilian tales, we find in them almost exactly the same supernatural machinery as that by which the action in the Norse tales is produced and controlled. Yet there was a considerable difference between the old mythologies of Norway and Sicily, which may account to a certain extent for some of the divergencies between the popular beliefs of the two countries at the present day. Similarities of this kind may sometimes be attributed to direct borrowing, but they appear to be much more frequently due to independent adaptation. The story of the "Three Lemons" in the present volume, has undoubtedly been conveyed from the Mediterranean, where it flourished lummiantly, to the North Sea or the Belticology whose alien shores its appearance is a rarity. But that of "Three Years withmost between the popular beliefs of having been conveyed to Norway by any

Tides from the Ffeld. A Second Series of Popular Tales, from the Bases of P. Chr. Ashidenses. By G. W. Bussett, D.C.L., Autior of "Tales from the Spree," Annals of an Eventful Life," Sc. London: Classian & Edl., 1872.

special route, or of its migration having been determined by other causes than those which mysteriously distribute the seeds of popular fiction. As the two stories are typical, it may be werth while briefly to examine them.

while briefly to examine them.

The hero of the "Three Lemons" is the usual youngest brother, who is sent for the prettiest princess "to be found in twelve kingdoms," and his early difficulties and ultimate success are of the ordinary kind. But one episode in his story is of a nature unfamiliar to Northern fiction. In a Troll's castle he finds three lovely princesses, who immediately turn into as many lemons, which he pockets and carries away. Becoming thirsty after a time, he bites a piece out of one of the lemons, whereupon a princess is discovered within it, who cries out that unless water is given to her she must die. No water can be found, and so she dies, and the same fate is underzone by the princess whom the hero finds in the ner she must die. No water can be found, and so she dies, and the same fate is undergone by the princess whom the hero finds in the second lemon when he takes a bite out of that. But the fair tenant of the third lemon is saved by the fortunate discovery of a neighbouring mill-stream. What is the exact meaning of this singular transformation scene it is hard to say; but that it has been borrowed by its reciter at Christiania from some Southern source a readered meable by the fact that is rendered probable by the fact that a prominent place is given in it to a Southern fruit; and the probability becomes almost a certainty when we find that no other Scandinaversian version of the story appears to be known to the commentators, while Italian variants are numerous. The earliest of these is to be found in Basile's Pentamerone, under the title of "Le tre Cetre." Others have been discovered in Tuscany, Piedmont, the Italian Tyrol, and have been discovered in Tuscany, Piedmont, the Italian Tyrol, and Sicily. The story is not by any means confined to Italy, for a Greek version from Asia Minor is given by Hahn, and another from Wallachia by Schott; but it probably made its way direct from Italy to Norway, just as the German version quoted by Zingerle in his collection of Tyrolese tales (No. 11) is likely to have been borrowed from the story current in the Italian Tyrol, of which he quotes (No. 52) from Schneller an imperfect variant.

In both these Tyrolese tales the magic fruits are pomegranates; but in the latter version they are tenantless, in the former they enclose fair maidens whose existence depends, after their exposure to the light of day, on their being immersed in water, in which

to the light of day, on their being immersed in water, in which they rapidly assume the ordinary proportions of womankind. The modern Greek version from Asia Minor corresponds closely with modern threek version from Asia Minor corresponds closely with the Norwegian, as also does Basile's Neapolitan story, in which however, the fairy occupants of the fruits do not die if water is not given to them, but only disappear. In the Sicilian story quoted by Clonzcubach (No. 13) the fruits are replaced by a coffer, in which is enclosed the "Fair one of the Seven Veils," who requires water to be thrown into it when it is opened, in order to anable her to exist and grow in Pitra's version from Castaltarminical control of the seven control of enable her to exist and grow; in Pitre's version, from Casteltermini, the life of the hero will be forfeited unless one of the fairy tenants of seven magic lemons will accept from him a proffered draught of water. In the Wallachian story the fruits are golden apples successively given to the hero, who is sadly in want of a wife, by Mother Wednesday, Mother Friday, and Mother Sunday. He is told to go to a fountain and give one of the golden apples to the fair maiden whom he will find there, but not until she has asked fair maiden whom he will find there, but not until she has asked him for water and accepted it from him. In his thirsty impatience he fruitlessly eats the apples bestowed upon him by Mothers Wednesday and Friday, but Mother Sunday's apple he treats more prudently, and when he bestows it upon the nymph who has quaffed his proffered beverage, she says, "I recognize in thee my destined husband." The story is evidently connected with some heathen belief in water spirits, akin, perhaps to that entertained by the Russian peasant with respect to the Russika, or Naiad, who will perish, he thinks, if she ever allows herself to become entirely dry; for which reason she frequently combs, like a mermaid, her sea-green locks, which have the power, when thus

Naiad, who will perish, he thinks, if she ever allows herself to become entirely dry; for which reason she frequently combs, like a mermaid, her sea-green locks, which have the power, when thus solicited, of pouring forth a copious and refreshing flood.

We did not undertake to explain the mystery of the "Three Lenone," on which we have dwelt merely in the hope of identifying the region from which it made its way to Christiania. But the story to which we are now about to turn admits, at least in part, of a very simple explanation. The hero of "Three Years without Wages" is a ploughboy who, at the end of the time specified, obtains, in lieu of other recompense for his services, a dog, a cat, and a lizard. At the lizard's request he sticks a knife into its tail, on which the reptile becomes a prince, whose delighted family bestow upon the ploughboy a magic ring which brings him everything he asks for. And when it is stolen by the bad princess whom he subsequently marries, and he is reduced to his former poverty, the dog and the cat combine to recover it for him, and all once more goes well. The story is utterly devoid of moral, and its principal incidents are not easily to be explained by reference to any of the mythologies or superstitions of Europe. But we have only to refer to its counterparts in India, and we shall tind it there assume a shape which is thoroughly in keeping with Indian ideas both as regards mythology and morals. We shall therefore be fully justified in placing it in the group of those popular tales which have clearly been transferred, during a comparatively recent period, from the East to Western lands, in which their originally formed No. 104 of the Mürchen collected by the Brothers Grimm, and will be found in Western lands, in which their original meaning has become utterly lost. A German version of the story originally formed No. 104 of the Mirchen collected by the Brothers Grimm, and will be found in some of the English translations under the title of "The Faithful Beasts." But it was subsequently omitted, on the ground that it was a mere translation of a Mongolian story—namely, the thirteenth tale of the Niddle Kir, which was supposed to have been made familiar by its manualation in Bergmann's Normalistic Strayweigh.

The hypothesis may have been correct in that instance, for the type narratives are suspiciously affine, but the story is, in several leads at least, as genuine a follable as many of its mesuspected companions. In Russis and in Greece, for instance, it is exceedingly popular, and many versions of it have been printed (see Highly popular, and it occurs at least five times in Raddoff's immense collection of songs and stories current among the Turkish people of South Siberia. But its original home was undoubtedly India.

The whole group of European folk-tales about the gratitude of animals for man's kindness may clearly be traced to the Buddhistic East. Not with the idea of merely whiling away an idbellious, but with the intention of teaching a moral leason, were those early Indian "beast-fables" composed, in which the doctrine of the transmignation of souls was conveyed under a generally attractive form. And not to a sentiment akin to the kindly modern feeling which in so many European lands has created Societies for the Protection of Animals were these eloquent pleadings in favour of which in so many European lands has created Societies for the Protection of Animals were these eloquent pleadings in favour of the brute creation due, but to a conviction that even the meanest of the inferior animals may have been, or may become, a man and a brother, may even be a Bodhisattva, a being destined to attain to the state of a supreme Buddha. From India the complicated stories into which these elementary parables developed passed at an early period into China, and in the course of time became current, in a modified form among the Buddhistic inhabitants of Central early period into China, and in the course of time became current, in a modified form, among the Buddhistic inhabitants of Central Asia. Later still, in all probability, they travelled weatwards, and one of their number, that of the "Faithful Beasts," struck the fancy and obtained a firm hold on the memory of many European peoples. In Benfey's opinion this story was probably introduced into Russia during the Tartar period, and thence made its way into more Western lands, its first appearance in print being in the early part of the seventeenth century, when Basile founded upon it the 25th and 31st tales of his Pentamerons. Its Norse rendering, under the title of "Three Years without Wages," seems to have been adapted from one of the fuller Slavonic versions. seems to have been adapted from one of the fuller Slavonic versions, The episode of the lizard which turns into a prince is a fragment of another tale, borrowed from one of the numerous Indian stories about Nagas, wherein a man renders a service to a snake, which turns out to be the son of a ruler over those serpent-demons. The incident is of common occurrence in Oriental stories; its mythoincident is of common occurrence in Oriental stories; its mythological explanation is perfectly simple from an Indian point of view. The serving three years without wages is another interpolation, belonging to an entirely different story, with which, in its modern form, the Whittington's Cat legend is generally connected. A tale of this kind is given by Mr. Dasent in the present volume under the title of the "Honest Penny."

Similar ideas have, no doubt, at different times and in divers places independently developed into similar narratives; and therefore the mera rescuellance between two stories is not a proof

therefore the mere resemblance between two stories is not a proof that one has been borrowed from the other. But it is very impro-bable that any such independent development should result in the production of two complicated dramas, divided from each other by great spaces of time and place, and yet agreeing in the sequence as well as the nature of their respective scenes. On the other hand, well as the nature of their respective scenes. On the other hand, there is nothing excessively improbable in the supposition that a dramatic tale of this kind may have made its way from people to people, sometimes being helped on its path by literary aid, but more often depending for its progress on oral tradition. And so, if a long chain of events is found narrated in an Asiatic as well as in a European story, the nature and the connexion of the several links being almost if not wholly identical, we may fairly assume that the one narrative is a copy of the other. Then, if the supernatural machinery or the moral teaching of the story be shown to be inconsistent with any ideas ever known to have been prevalent in Europe, but thoroughly in accordance with those which have certainly prevailed, and perhaps still prevail, in Asia, we may safely assume further that the European narrative has been borrowed from the Asiatic. Let these tests be applied to the longer stories in any collection of European folk-tales, and, unless we are much mistaken, their Eastern origin will in most cases we are much mistaken, their Eastern origin will in most cases

stand confessed.

THE ALPS OF ARABIA.*

THIS is a book with a high-sounding and misleading title, horrowed, perhaps unconsciously, from Sir F. Henniker's Notes during a Visit to Egypt, as quoted by Dean Stanley. The author, who informs us that his profession obliges him to work in a crowded and smoky capital, started from Alexandria in January and ascended the Nile as far as the first Cataract. Having accomplished this by no means arduous or unprecedented feat, he crossed the Desert from Cairo to Ismailia and Suez, visited Mount Sinai, went up the western shore of the Gulf of Alashah to the place of that name, and, after a short stay at Petra, trayered the Sinai, went up the western shore of the Gulf of Akabah te the place of that name, and, after a short stay at Petra, traversed the Holy Land from south to north, taking in his way the usual places of interest, and ending with the ruins of Baalbec. Now there was once a time when Sydney Smith could write of an Egyptian traveller as one entitled to make a profound sensation in acciety by the mere novelty of his experiences. The test of a good novel, the witty Canon wrote, is, that it should make a reader itattentive "when a hishop is speaking," or when a gentlemin "fresh from the Pyramids or the Upper Cataracts is let loose on the drawing-room." The works of a host of liarned and attractive writers, and the increased facilities of communication,

The Alpe of Arabia: Travels in Egypt, Stand; struble, and the Hold. By William Charles Maughan. London: Heavy S. King & Co.

pair at the class of the great war with the First Napoleon. Now an every one-onlives made a subject with the First Napoleon. Now an every one-onlives made a subject with the sugrams of Ecoless, or fixed the Bean of Westminster, or with the sugrams of Ecoless, or fixed the with the conious knowledge of Dr. Robinson. Revertheless something is to be made out of a journey of four months in Egypt and Palestine if a man is skilful in selecting his topics and appearts in his remarks; and there are some things of which the world is never weary, and on which every fresh market or can shed a little additional light. Unluckily Mr. Maughan, thogrif observant and grifted with a good eye for natural scenery, cannot treep his pen and his feelings under command. The whole of his trip up to Assouan might have been omitted. He is far too much given to guah in "recollections," and "associations," and "solemn thoughts," and "mighty names," and "immutable desolations," all of which, to be endurable, must be clothed in striking and nervous language, or should be neatly suggested to the reader, who can follow them out for himself. Every man of education and perception may be fairly left to warm his picty at Iona in his own fashion, and to reanimate his patriotism, if it needs it, at Marsthon, or by his own freside. Then glowing sunsets and moonlight nights are Mr. Maughan's especial snare; more than half-a-dosen times does he broak out into rapturous descriptions of sundscapes, rivers, and rucks, as seen at eve or after sundown, for which the whole dictionary is ransacked. "The afterglow overspreads the horizon. Palm groves, billowy plains, and dim mountain ranges are blended into a ghostly and harmonious whole. The shimmering stream steals away like a shroud, or changes its dingryellow for a ghostly, glassy hue. Tombs cut out of the rock have a cavernous, melancholy look. A red tinge on the horizon is delicately graded away through a succession of tints of all shades, into the dark sapphire of the screech of an owl. Clear lustrous j

There is, however, a good deal to be gleaned from Mr. Manghan's volume in the way of hints for the trip, especially of that part which the Overland Route has rendered accessable and familiar. Twenty years ago a dahabeah was the accredited mode of proceeding up the Nile. When the vessel had been thoroughly purified of vermin, and had been well provided with stores, books, tins of provisions, and mosquito curtains, a party of two or three gentlemen had all the keen enjoyment which leisure, a fine climate, and good companionship could supply. But it required at least two months to reach the first Cataract, and after a time the monotonous character of the ascent became very trying. Men who are not keen sportsmen or practised linguists tire of attempts to pick up a few words of Arabic from the Ress and his crew, or to vary the daily meal of chicken and omelette by shooting wild pigeons or waders and divers in the glare and heat of the mid-day. Long reaches of the river intervening between the places of historical interest seem never to end, and many a traveller, besides being scared by the expense, would prefer to the dignified solitude of the private boat the miscellaneous congregation of the steemer, which gets over the uninteresting ground at a good pace, allows three days for Thebes, and perhaps a day at other places, and so lands the traveller back at the port of Cairo in less than one-half the time required for the old-fashioned mode of "doing the Nile." There is nothing in the visit to Shoubra near Cairo and to the Pyramids which calls for criticism; nor has Mr. Manghan thrown any new light on the monuments of Luxer or Edfou. Neither do we care to quote any scraps of salar which he picked up from the Cairo donkey boys, or to follow his retrospect into the "stream of time," "the majestic traditions," and the "princely list of conquerors" who "flashed like a meteor" on his blinded sight.

on his blinded sight.

We pass on to the journey across the Desert. Mr. Maughan took Ismailia on his way to Sues, but he seems to have been under a misconception, or to have missed the moral of the spot, when he records that there is little to see at this place, and that he "disposed of the sights in about half an hour." The mirsele is, not that there is so little to see, but that Ismailia has actually been called out of nothing into existence by the simple cutting of a fresh-water catel. That a spot which was either a waste of sand or a collection of Missrable Arab huts a few years ago, should now boast an "Hotel Pagnon," some cases and billiard-rooms, and any trees or vegetation at all, and should be the residence of Europeans and or a military behd, is an exmest of what might be done to turn deserts into rice-fields, if the Visaroy of Egypt would only construct a series of examps to earny. Nile water all over the country

just when the river is at its height. After visiting that the author came down on the Gulf of Alabah, and noticed the initiality number and variety of the shells, as well as of the coral fragments, which doubtless led the Greeks, as Dean Stanley well district. We call this sea Red, while the Jewe called hithe "Sea of Wastle." Here, too, he had a distant view of the small island of Kurelysik, which few travellers in modern times have visited, except Labards the Frenchman, and Wellstead, who was employed by the Reat India Company to survey the place in 1833. Mr. Manghan is rather too much addicted to quoting whole pages from the works of furner travellers, and to give summaries of history; but we can quite furgive hist for his borrowed description of the ruins whose very founder is unknown. The island is of granite and consists of two hillooks connected by a flat isthmus. It is difficult of access and has been locally known as the "Island of Pharach," doubtless from the same spirit in which the celebrated well at Cairo is ascribed to Joseph. A wall, partly in ruins, and with turrets and embrasures, on the northern mound, encloses some edificas which have arches and a Durk column still standing, and fragments of pillars half concoaled in rubbish. Tanks had been hown out of the solid rock to supply the fortress with water. We cannot find any mention of this island in the works either of Doan Stanley or in Dr. Wilson's Lands of the Bulle. The French explorer, Laborde, planted the white flag of the Bourbons on the highest of its rocks, in the name of his nation, in 1828.

on the highest of its rocks, in the name of his nation, in 1828.

The account of Petra is perhaps the most interesting and satisfactory portion of the book. Most travellers appear to have entered this only from the west, after passing the "wide and desert valley of the Arabah." Laborde and Mr. Maughau managed to turn the eastern range of the Arabah and to enter the "Sik" or gorge of the Rod City, from the south, through the Wady Ithm. The reductance of the Araba to allow strangers to view the mins unmolested has not yet been fully overcome. Dean Stanley, as was to be expected, was neither plundered, insulted, or mobbed, and he especially commenorates the "princely courtesy" which was shown to him by Shelkh Mohammed, who at the time of his visit, 1852-3, was the eldest son of the celebrated chief of the Alawins, Shelkh Hussain. The headship of the tribe by this time has devolved on the said son, Sheikh Mohammed; and between his claums and those of another local celebrity, whose name is in these pages metamorphosed into "Abnegazion," and the disputes of the Follaheen with the Dragonan of the party, and exorbitant demands for "backshish," Mr. Maughan and his companions appear to have had just sufficient alarm and annoyance to give zest to their adventures. The Arab Bedouin or Bedawi is, however, at his worst, for many many the freight which enters his doubseling on the ships of the Desert. Travellers may be husted, saluted with blank cartridges, kept awake all might by guttural ejaculations, and forced to jurchase peace and quiet by emptying their pures into the hands of their Dragonan, in some doubt whether the whole scene may not be got up for his especial benefit, or at least in complicity with the wild men of the Bosert. But their ears are not slit, nor are three Englishmen held in durance until a fourth has gone on to Jerusalem or back to Cairo in order to levy the ransom of his companions. On one occasion Mr. Maughan scens to us to have apprehended danger and to have detected bood hirstiness from a mere igno

We cannot quote any of the passages in which the author describes, and not with undue abundance of diction, the extraordinary site, the crumbling excavations, and the exquisite structures which Grecian skill and Roman magnificence have combined to raise in a valley which, till the commencement of this century, had baffled or escaped all the researches of travellers. As a place discovered by Burckhardt in the disguise of an Arab, and only half explored by Irby and Mangles; night to the mountain where the Great High Priest of the Israelites was buried; as, by a preponderance of authority, successfully identified with Kadesh-Barnes; presenting a combination of purple-coloured rocks, firsh verdure, and magnificent ruins; as a spot approached even now with some difficulty, and yet not quitted in haste or without regret, Petra may take a high rank in the list of those exhumed or deserted cities which have afforded a long succession of puzzles to linguists and scholars. The remainder of the tour does not appear to have given birth to much adventure. The travellers made a little expedition to Jericho and back; and an a rising ground which afforded a fine view of the

Dead Sea, came on a congregation of tents, each with its own flag, showing that English, American, French, and Germans were apparently sujoying life and having a picnic of nations. In fact, on the heaten tracks in Syria and Egypt there is nothing like solitade or immunity from intrusion. Mr. Maughan properly notices a tradition, due to the Mohammedans, to the effect that Moses is buried, not somewhere on Mount Pisgah, "but on a height opposite the Red Sea." Neby Musa, however, as he writes it, does not site the Red Sea." Neby Musa, however, as he writes it, does not mean "the grave of Moses," but Moses the Prophet, "Nabi" being a title given by Mussulmans to all those divine messengers who preceded their own Mahomed. Thus we have elsewhere Nabi Bannel, Nabi Yunas or Jonah, Nabi Yehiya or John the Baptist, and Nabi Zur, or the founder of Tyre. The Arabic word for grave or tomb would generally be Kabr. It is curious that Mr. Maughan does not seem to have heard of or read the two volumes by Maughan does not seem to have heard of or read the two volumes by 1r. Wilson, the Lands of the Bitte. While quoting freely or referring to Burckhardt and Laborde, Dean Stanley and Dr. Robinson, he access to be ignorant of the writings of a scholar who brought to the elucidation of many historical and social questions a very competent knowledge of more than one Semitic language, a thorough acquaintance with the works of previous writers, and a familiarity with Oriental manners which makes him in many points an admirable guide and companion. In some aspects Mr. Maughan is not disqualified for telling us what he saw. He is not dull. He soes and describes natural productions and pictures one dull. He sees and describes natural productions and picturesque hits of scenery. He is evidently penetrated with the religio loci. He has taken some pains to consult authorities, and has spared no trouble to commit his observations to writing daily and on the epot. But, as we have noticed in other cases, the excursion of four months might easily in print have been compressed into two hundred pages, at the rate of fifty for each month. There are so many enchanting features in the Holy Land that we by no means imply that no more books should be written about it. The security would be attractive without the associations. The history and the remains would invest it with hearts. and the romains would invest it with beauty, even were the whole country as barren or desolate as the Arabah. saited for exploration, moreover, enables men of leisure and wealth to avoid any-winter which has dropped out of its place in the seasons to re-appear in an English spring. But then writers ought to pick their subjects, repress their fervid imaginations, and condense and prune their style.

WILLIAM ELLIS, THE MISSIONARY.*

I THE author of "Polynesian Researches," even though we may hesitate to receive the assurance that "his name is spostolic n its missionary achievements" (p. 302), was unquestionably a considerable man—at/least a bishop in his chosen calling—and his son has aketched the history of his active and honourable life in a simple, frank, and natural style, which is not the less effective for some obvious lack of literary skill and experience. It is far more profitable as well as more pleasant reading than the ambitious supplementary chapter devoted to the great missionary a "character and work" by Dr. Allon, respecting whose unseasonable love of erclesiastical polemics we may have to say a word presently. If there is one enterprise which beyond all others might be supposed to attract the sympathics of religiously-minded men, it is surely that which forms the main subject of this volume. The triumphs won by our faith over the strongholds of idolatry have been how and scanty indeed in modern times, yet we need not grudge the tribute of our reverent admiration to those who have been foremost in the battle, nor deem their unselfish labours lost even though they may seem to have been ever so unproductive of the results we could have desired. Men like Carey and Morrison, like Henry Martyn and Bishops Mackenzie and l'atteson, belong to no sect or party; they are the common possession of Christendom. And if the case of William Ellis at all differs from theirs, it is that he has left behind him more visible and (as we trust) enduring memorials of success than have been accorded to the efforts of some who strove as earnestly and perseveringly as he did.

The hero of this momeir was born in London in 1794, of parents whose circumstances were very humble. His mother had left her mative town of Reading to take domestic service; his father was a mechanic, though his grandson seems strangely unwilling to particularize "the special manufacture in which the young man was engaged." When the child of such a huma attains a way engaged." When the child of such a home attains to distinction, it will almost invariably be found that at least one of his parents possessed qualities suited for a higher station. In William Ellis the gentleness of his mother's disposition and her sensitiveness of spirit tempored and adorned the firmness and masculine energy which he inherited from his father. The latter is described which he inherited from his father. The latter is described as a man of good natural parts, much shrewdness, and genial humour, fond and proud of his oldest son, as well he might be; but so "advanced" and "liberal" in his religious opinions that the Unitarian chapel was his refuge when he was most inclined to be devout. It may well be imagined that these tendencies on his purt gave his eminent son no small distress, and long after, on the occasion of his mother's death in 1837, he closed his remonstrances to his surviving parent with a prayer which, if excusably uttered, ought never to have been reproduced to the world:—"May the Lord have mercy on him and save him at the elevanth hour."

As marly as 1797 this industrious mechanic took goet in a strike among his follow-weakman (such things as stellow substant eighty years ago), and was compalled to migrate with his family to the Cambridgeshire fens, where after a while he become one of the hands employed by Mr. Usill, a candle-maker at Wicheach.

What education young Ellis could pick up must have been chiefly at home, for at six years old he was employed at two shillings a week in winding cotton wicks with one hand, while numing his little brother with the other. But there were a few books in the house, such as Captain Gook's "Voyages," ambellished with tempting pictures, and now and then the child might pick upon sixpence of his own by holding a gentleman's horse, wherewith to buy a second-hand volume of Travels. Besides this taste for reading, the boy was so happy as to form a predilection for another pussuit, bny a second-hand volume of Travels. Besides this taste for reading, the boy was so happy as to form a predilection for another pussait, in its influence hardly less humanizing, that of gardening. "Klere began," he said publicly at Wisbeach, sixty-six years afterwards, "when I was scarcely five years old, that strong desire to understand the processes of vegetable life, and that unspeakable pleasure in meeting with new, rare, and beautiful forms of plants, flowers, and fruit, which through all the intervening changes of life have been to me a source of pure unmingled thankfulness and pleasure." Accordingly, before he was twelve years old he left his candle-Accordingly, before he was twelve years old he left his candle-making and slight irregular attendance at school to become apprentice to a neighbouring market-gardener. From this situa-tion he was promoted at thirteen, as a quick handy lad, to the service of a clergyman, who long continued to take an interest in his fortunes; then to snother clergyman's, whose well-furnished library was open to him when work in the garden was done. At seventeen he transferred himself to Kingsland, near London, to learn in a large nursery-ground the more abstruce searcts of the calling which he looked to follow.

We have pursued William Ellis's modest career thus minutely,

because we have here, throughout his son's narrative, in substance though not in form, as genuine a bit of autobiography as ever was written. Men have risen in life as he did—some few, though not written. here have risen in life as he did—some lew, though though many—on whose mind and manners the sordid cares of early poverty have left no trace whatever; whose easy gracefulness of literary style would suggest any scholastic training rather than that of a gardener's assistant. But such persons are usually reticent about their youthful days; some through constitutional reserve, others in consideration for the children who look up to the constitution of the them with respect; yet more from the notive which Dr. Johnson confessed to—pure dislike to trace what he chose to call "the annals of beggary." We institute no comparison in regard to annals of beggary." We institute no comparison in regard to usofalness and dignity between the poet Crabbe and our missionary; but parts of this volume strongly remind us of sionary; but p Crabbe's Life by his son, as well in their candid disclosures as in the geniality of the spirit which inspires them both. What a contrust they exhibit to the false shame and impotent resentment with

which Dickens has told a not dissimilar tale!

The turning point was now nigh at hand, when the love of study and of nature was to be absorbed in a yet nobler passion; for nothing less than a passion was Mr. Ellis's anxiety to make known to others the highest truth as he received and held it. At the two clergymen's houses he had imbited no more than such a general reverence for religion as stood him in little stead among the special temptations of London to so young a man; but the next year he again changed his place and became an inmate in a religious household, which worshipped at a chapel of the "Independent," or (as it now calls itself in preference) the "Congregational" dent," or (as it now calls itself in preference) the "Congregational" persuasion. This accident, it as such it must be regarded, determined his choice for life. He joined that communion, as so many thousands join all communions, through no deliberate preference of its peculiar doctrines or discipline, about which they may not be curiously anxious, but simply because they have learnt in such assemblies the value of religious exercises. He now became a Sunday School teacher at Silver Street by London Wall, where he met with her who was afterwards his first wife, Mary Mercy a woman of the same temperament, as his mother, though Moor, a woman of the same temperament as his mother, though somewhat her superior by birth, and who in the same Surrey Chapel, "and glowing with the same aspirations," was first moved like himself by an impressive sermon to go out to preach the Gospol to the heathen. He had just completed his twentieth year (November 4, 1814) when he addressed to the Secretary of the London Missionary Society, which was then supported chiefly, and is now entirely, by mombers of his denomination, a formal application for employment, which is here published at length. One or two extracts alone we are able to give, as being at once characteristic of the man, and not too purely

I can conscientiously affirm that it is not an impatience to be freed from envising that is ink-some or unpleasant in my present situation that induces me to offer myself as a candidate; nor am I influenced by any secular motives, for I am perfectly satisfied with my present station in all respects, and have reason to believe that I give satisfaction to my employers. I should be unwilling to leave my present place on any other account.

I have but little to recommend me to the Society, having had but little education, and most of what I have learned I have learned from observation. I have been accustomed to work in the garden, which eccupation forms the chief part of my present employment. I received must be of "Qualifications for Missionarics," after reading which I intulged a hope that, although my telents were of the lowest cort, yet I might be accupated. I move declare myself willing to follow wherever Providence may lead my.

In any other mean in his position it would have any medial as more I can conscientiously affirm that it is not an impatience to be freed from

In any other men in his position it would have sounded as more affectation to profess himself indifferent to the social advancement

^{*} Take of William Ellis, Missionary to the South Sons and to Madagamar.
y his Bon, John Etzmo Ellis. With a Supplementary Chapter containing
a Ketimeta of his Character and Work, by Henry Allon, D.El. London: John Murray. 1873.

which must be common distanting what he cought; he life. He was destributed the consistency of a constant and leastlibuted. He was destributed to be a constant and leastlibuted. He was a supply destributed to by the County consistency of the least and tenus again the discissy ever had: White Matthew Willis, one of the few chargeness on the Board of Enaminers, had could him where he had received his education, his reply was " in my badenous "; and, indeed, he had stolen mainly from his night's must the time for learning what little he had acquired. Raw as he man, the Directors were at first for sending him straight to Africa, fill they had yet to discover by repeated disappointments that thom who set up to instruct others, even in the Rible, have shandant need to know a little themselves. This arrangement was subsequently changed, and Ellis was allowed a year's very necessary proparation under Drs. Bogue of Gesport and Pye Smith as Homerton, previously to his ordination as a paster, and his mainlegs the next day to his faithful hapmate, who wanted nothing but health to be all that her husband could have hoped for.

Their destination also had been changed when their departure was postposed; they were now bound to the South Seas, and, in the first instance, to the Society Islands, a remote volumb group seen by Quiron in 1606, but virtually rediscovered by Walfis in 1767, and visited by Cook in 1769. The delicious climate of these isles of bliss, their rich tropical productions, the volumbous beauty of their women, and the aboninable institutions of their base idolatry, had been coloured by Dr. Hawkenworth somewhat too vividty for the taste of a not very fastidious age, and his unlucky book had doubtless the effect of directing the earliest efforts of the newly-founded London Mission to spots where man alone seemed vile. In 1796 the good ship Day, whose perilous voyages made a favourite reading book for young people lifty years ago, was despatched with a cargo of missionaries, eighteen of whom were to be left at Tabiti and its smaller neighbours. They were mostly men taken from the same chase as Ellis, but without any share of his ability and power of self-culture; so that it is nothing wonderful that, set on by drunken and profligate sailors and adventurers from Europe, to whom the spot had become a favourite refuge, the natives rejected their teaching, stripped them of all they possessed, murdered three of their number, and drove the rest into the woods and caves of the rocks. The prospects of the mission were improving, and the ministers had returned to Eimeo, a little member of the Society group, when Mr. Ellis and his wife arrived early in 1817, some thirteen months from Portsmouth. The native Christians numbered at that period scarcely more than fifty. but the presence of a superior mind, and the decision of a true ruler of men, soon made themselves folt. After he had learned the language, which was to him a matter of little trouble, and had made good progress in the work to which he had been specially appounted, his views extended from this small archipelago to that larger one about two thousand five hundred milee fur

Returning to his native country in the very flower of life, with a reputation in every way deserved, William Illia is presented to us in a new character. For more than five, years he was employed as travelling agent by the Society he had served so well. This was hard and uncongenial work, but he threw himself into it cheerfully, or at least uncomplainingly. On these tours his thorough earnestness and varied information always made their way, though his speaches were characterized rather by fluency than elequence, and were at times so diffuse that it needed a friendly twitch of the coat-tail to bring his oratory to a close (p. 185). He did the cause he loved far better service by his pan. At this period he published two most interesting books, whose substance must have been prepared long before—namely, his Tour through Hassess and Polynesiam Researches, beyond comparison the most picture-que narratives of missionary enterprise at that time extant, and well worthy to take their place in English literature by the side of Bishop Hober's "Journal." In 1831 a weary itinarant life was ended by his being chosen for the highest preference he could well aspire to, the office of Foreign Secretary-in-Chief of the London Missionary Society. In that responsible capacity he tasked his energies so unsparingly that in 1839 ill health compelled him to sack temponary repose; and after spanding a year at Pau to little purpose, he was at length forced in 1841 to resign his post and to retire to the little Hertfordshiru town of Hoddesdon. He had by this time lost the loving companies of his early manheed, who, after more than ton years of acute suffering, endured with mint-like patience, was removed from him in January 1835. She had given him a charge which we have of much offence in acute failant to see than in real life—to provide for himself another wife who should be kind to his matheriae, he despites; and after a decent wife whoo should be kind to his matheriae.

when editor of a little mound, the Christine Mignetic. Missister and biographer praises his stepmenter highly; equivally nationally anticoming affectionate care of his stillered siners, two of whom the manual till a long sinhman closed in dusth. For the rest, the conventional and wife might uses to have agreed in little distributed and wife might uses to have agreed in little distributed and with what in him must be called an incommutant highly and programme from dusting programmes and programmes and punctuality. Each of them was distinguished by strong including and punctuality. Each of them was distinguished by strong including yet their union was eminently happy. The husband in his mature age exchanged a melancholy too natural with him the habits more social and communicative (p. 196); and after thing five years of wedded love, having calmy received her partners have breath, the faithful wife retired to her own chamber to die best seven days after him. "Sane uhi idem at maximus et homestications amor cet, aliquanto present morte jungi quam with distrabil."

At Hoddesdon, in a charming cottage whose garden was hill out by his loving skill, Mr. Ellis lingered for twelve years (1820—53), recruiting his broken health, officiating as paster to a small body of Congregationalists, always ready to take a wider flight if duty seemed to call him from home, extermed and respected by all around him of whatever communion, yet, oddly enough, surprised that a new-born seal against Church rates made some of his neighbours look more coldly on him than their wont (p. 180). From this retirement he went forth, when sixty years of age, to become a missionary at Madagascar, in a sphere of action which must have been quite novel to his experience. He coor found himself immersed in the shifty politics of that semi-barbarous kingdom, and his son's narrative, referring as it perpetually does to extraneous sources of information, hardly allows us to see our way clearly through the mist. That his several visits were sources of much consulation to the persecuted native Christians needs not be stated; that his motives were the purent, his honour beyond question, are facts sufficiently attested by the whole course of his perpetual conflict with almost every European that crosses his perpetual conflict with almost every European that crosses his path; not only with the French consul M. Lambert, but with the English consul Pakeuham too; with Abbé Jouen and the French he terms "Roman Catholicism" exhausted all the higotry which his mild spirit was capable of cherishing. His son and Dr. Allen, treat this period as the most glorious in his life. "For Our" two part we are plad to welcome him safe home, again by the end of 1865, and to find him spending his goatle divelue in his old work, trauping on deputations, and preparing for the press an edition of the Malagasy Bible. Ho died in his seventy length year, on the 9th of June, 1872, after three days' illness, and was fitty homound with a public funeral by the Directors of the London Missionary Society.

We like Mr. J. Eimeo Ellie's book so well that we will only use him to record in his second edition the plain fact that the Society for the Propagation of the Gospel in Foreign Farth is a century older than any of these commercial in the first page of his "Introduction." Dating as he does from Upper Chinda, a prome full of that Society's good works, his forget/siness in the more to be marvelled at. With Dr. Allon also we would fain part in peace, if he will but let us. We shall not get him to also his not authorssed opinion about "the disastrous history and issue of Established Churches in all nations" (p. 304), nor shall we modify our own judgment respecting the had taste of drapping such topics into a context which could better dispusase with them. If "to the Madagascar of future generations William Ellis will be. In the Madagascar of future generations William Ellis will be. England, what Houisace was to Germany, what Augustine was to Ireland" (p. 304), it certainly is not because he abstained from worldly affairs, but because he sought to control them according to the light that was in him. The legislatur of the Seriety Islam (p. 77), and the intimate commeller of Radama II. (p. 256), is just we believe to them all, of "forging classes to bind the Christian onergy and life" of posterity.

A WHALING CRUISE .

CAPTAIN MARKHAM took a voyage last summer to Baffig's which might be useful for future Arctic exploration. As he was appointed to H.M.S. Sallon within three weeks of his arrival in England, his journal has been printed during his absence almost in its original form. However valid may be the apology, we cannot say that the books of travel which are put together after this fashion are generally amusing. They have, indeed, the meets which belongs to impressions recorded at the moment; but they are apt to suffer both from the inevitable repetition and fases the onission of many things which at the time seemed to be too familiar to need explicit notice. Some such faults may perhaps be occurionally detected in Captain Markham's marritive; but we have on the whole very little to say signiset it. Here and these we might wish for more composition, or for a fallow description; but the narrative is lively, unaffected, and

* A Whaling Cruise to Baffin's Bay. By Albert Heatings Makham Landon: Sanipson Low & Co. 1874

ntly indicative of the writer's characiently clear, and all the cleaver because he takes no to to imprese us with the fact that Captain Markhum is the of the right material for Arctic exploration. He is always that or the right material for Arctic exploration. He is arways cheer-ful, alive to the good side of his companions, keenly interested in his pursuit, and ready to take energetically to any piece of work that falls in his way. His object is, of course, to encourage his countrymen to make another dash for the North Pole by way of Smith's Sound; and we wish him all success in his laudable endeavour. Meanwhile, as great part of the book is devoted to giving a detailed account of the manners and customs of whalers, we are inclined to ask a humble question. Might not some gentlemen who are in want of sport find an agreeable variety in a cruise after whales? So far as we can reduce to any logical In a cruise after whates? He far as we can reduce to any logical formula the motives which lead men after grouse, or deer, or salmon, it would seem that whate-fishing has every claim to rank amongst recognized sports. A large number of athletic young men will be engaged next summer in circumventing salmon; but if the dignity of sport is to be measured by the magnitude of the pray a whals is to a salmon related to the pray a whals is to a salmon related. young men will be engaged next summer in circumventing salmon; but if the dignity of sport is to be measured by the magnitude of the prey, a whale is to a salmon what a salmon is to a minnow; and whale-fishing, or, to speak more accurately, whale-hunting, should rise as much above salmon-fishing as salmon-fishing above bobbing in the Serpentine with a crooked pin and a bit of thread. When a gentleman has the luck once or twice in a week to find himself at the end of a rod with a thirty-pound fish at the end of his line, he talks about it for days, and when he returns to London is capable of boring any one who will listen to him with the minutest details of his glorious sport. What then must be the satisfaction of feeling yourself fast to a monster sixty feet in length, with some twenty tons of blubber atowed about as a mere length, with some twenty tons of blubber stowed about as a mere miscellaneous item in his gigantic carcase! The salmon forces poor Mr. Briggs to run a hundred yards along a river bank; the whale will tow a boat through fifteen miles of sea, and occasionally not only a boat, but a loaded ship of four hundred tons. The salmon has a nasty way at times of snapping a line by a sudden rush; the whale sinks a hundred fathoms or so, and drags the boat after him. The salmon gets into awkward corners of a pool; the whale takes out a mile or two of line under a field of ice, and requires to be persuaded out of his sulks by firing harpoons at him instead of pelting him with stones. When you have landed your salmon, the trouble of carrying him home may justify a gillie in a claim for a glass of whisky; we know not what reward would be due on the same scale to Captain Markham and the boat's crew who on the same scale to Captain Markham and the boat's crew who had on one occasion to tow a dead whale behind them for eight hours. Luckill, a whale, like most animals and men whose constitution tends to the development of blubber, is a creature of stitution tends to the pacific habits; for, if he had the sense aliquiarly amiable and pacific habits; for, if he had the sense should a maything short of an ironclad armed with heavy guns. parsued in anything short of an ironclad armed with heavy guns. Still the mere play ulness of such a brute is apt to be awkward to its immediate we have a plunging whale, his chances of revisiting a rope which it is fast to a plunging whale, his chances of revisiting the upper a reflap of the tail of one monster, just touching the armall; and a more than the sense and the sense are flap of the tail of one monster, just touching the the upper are flap of the tail of one monster, just touching the all; and a m Captain Markham was following him, failed by the amall; and a m Captain Markham was following him, failed by the dingy in which it in smashing the whole concern to atoms, and, as it was, gave On another occasion he described a narrow escape from a similar catastrophe, when, as he says, fall the other boats were miles awis, with one exception, and that one, being fast to a whale, would, he suppose, have thought twice before coming to his assistance. We should have hoped that these sportamen would a higher value on each other's lives; but doubtless it was assistance. We should have hoped that these sportsmen would have set a higher value on each other's lives; but doubtless it was not the reflection that a whale is often worth a thousand pounds or more which would have caused any hesitation, but that overpowering excitement which makes all objects seem unimportant when one is in the process of killing any living being.

For fear lest this brief indication of the pleasures of the chase

should send off any number of eager sportsmen to Dundoe, whence the fiset annually sails, we think it right to add that a certain amount of discomfort is to be set off against the pleasures. We find even Captain Markham confessing that on one morning he felt some reluctance to get up and witness a run—if that be the proper word for describing the pursuit of a whale. In fact, it seems that his stomach was a little turned by some of the incidents. The pursuit is all very well, but the process of cutting up the whale afterwards is not calculated for aqueamish people. Captain Markham is of course superior to the weaknesses of wretched landsmen; but he seems at times to have been in a condition which might be called sea-sickness if the predisposing cause had not been something else than the motion of the waves. In fact, when the sport has been good, the blubber seems to pervade the whole ship. Not merely is it impossible to find a tolerably clean place on the deck, but the unctuous substance insinuates itself into the cabin, gets into one's clothes, and infects the atmosphere. Everything which you eat or drink tastes, we should imagine, of blubber; and, according to Captain Markham's description, the arrangements for feeding are not precisely elegant at the best of times. The captain of the Arctic, in which he sailed, appears to be a pattern seaman; hearty, blusterous, as well as skilful and daring in his profession; moreover, we are glad to hear that he is well read in Shakspeare, and could give long recitations from his plays; but, with all his marks, the Captain, as we gather, was at times a rather trying host. Whenever Captain Markham asked for a slice of beef welghing less than a particle work indicates a tradition in the Arctic and that

thinner than was desirable. State gigantic con of the season had brought back to his measures. Though we are not expensively told as much, we infer that these joyial mariners would have been scarcely suited for the society of an exquisite. Dim visious are indicated of a peculiar kind of festivity called a Molly. The original "molly" is an Arctic bird which gorges itself which blubber and offal till it becomes unable to fly; it has then a pleasant habit of rejecting its food and returning to take the action cargo. We are left to infer that some kind of snalogy has assented itself to the seafaring mind between the manners and customs of the bird and those of the guests of a so-called Molly. Society, indeed, must necessarily be limited in the Arctic regions; but wherever two or three whalers are gathered together one hospitable captain runs up a tub to his masthead and his fellows speedily arrive from the other ships. We can fully believe that next morning there is frequently a small of brandy, run, beer, and tobacco in a small cabin, which is able successfully to encounter even the odours of blubber. From various indications, indeed, it is plain that nobody of very delicate stomach should rashly take a passage on board a wiciler. But if any robust person should be smitten with the desire of whale-catching, he will have the compensation, if we may trust Captain Markham, of making the acquaintance of a set of thoroughly manly and skilful season. Indeed the occupation is one which requires high qualities, and the enterprise of the men is stimulated by a system which gives all the members of the crew an interest in the racuits of the cruise. Each man receives a certain sum for every ton of oil and whale-bone, besides rewards for success in capturing; each fish. The service is thus a popular one, especially under successful captains, and the crews appear to be above the average. Captain Markham, looking at the matter from his own point of view, considers that he could get an admirable set of volunteers for an expediti

We need not follow him into further details; but, on the whole, we may safely say that he has drawn an interesting picture of a curious and adventurous branch of trade. The literature of whaling is not very extensive; though Captain Markham has had some able predecessors. But its traditions and its modern history deserve some notice. We have only space to add that he gives some interesting information as to the crew off the Polaris, which was brought home in the Arctic; and that he describes some relies of former adventure in those regions. We must quote the quaint but really pathetic epitaph out one of the graves at Port Leopold, in Prince Regent's Inlet. In a bottle at its foot was a paper with these words:—"Near this spot lay the remains of Thomas Coombs (late belonging to the carpenter's crew of H.M.S. Investigator), who died now foord that ship on the 27th day of October, 1848, after a lingering illness of three months, which he bore with Christian fortitude. And I sincerely hope, should any Christian fall in with this, that he will leave his body rost in peace and undisturbed, and oblige his late chum and messmate, Charles Illarris, A.B."

MISS MACARTHUR'S SCHOOL HISTORY OF SCOTLAND.

THE History of Scotland before us is so small in bulk that it would not add materially to the burdens of any enthusiastic patriot who might wish to peruse it on the summit of Ben Novis or Ben Crunchan. Its cost is so moderate that the most prudent native of the land whose annals it condenses need not scruple to include it in an outfit as slender as that of Roderick Random himself when first starting in quest of that success which is denied to no well-conducted Scotchman. But its merits are not summarized in the double praise of cheapness and portability. Its errors of commission, if it contain any, are very trifling. If any charges of omission are to be brought against it, we should be unwilling to hold a particular volume in a series responsible for the results of a system to which it necessarily accommodates itself. As this is the third volume of Mr. Freeman's "Historical Course for Schools," which began with his own General Skatch of European History, it may be worth while to consider how far the example before us may be regarded as a promise of success for the entire scheme which the editor appears to propose to himself.

Not only was the need beyond dispute of some such attempt heing made as that which is now in progress under the direction of one of the most eminent of our historians, who moreover has had some experience of the results at least of the ordinary teaching of history, but this need has cried aloud, and has not been least sudible in the columns of this journal. But we live in an age of progress, though it is not always quite certain of progress to what. Thus, though the teaching of history in these kingdoms had been neglected even longer than the representation of the Commons of Scotland in Parliament, the reform has begun at last. The example has been set in high quarters, at least in England; for the Scotch Universities have, so far as we are a standown nothing. Oxford and Cambridge, as became them, have book set to work. Oxford and Cambridge, as became them, have book endowments for the encouragement of the study and trailing of

"History of Scotland, By Mangaret Macaribus, (Vol. 211, of "Returical Course for Schools," Edited by E. A. Francisco, D.U. of Landon Macarillan. 2012.

by her remodelled her system of Modern History examinato far at any rate is the University is concerned, for there
least one funces college in which a bountiful etholership
rds the vister in an examination which is simply switch in the
ness of the very conception thereof. Cambridge—possibly with
nignant intention of training on a unficiently broad hasis
likes who may go out in twose to scalemate the culture of the
uncotaring districts—has besued a scheme for her future History
as which remembles the table of enceties who may go out in twos to scalemine the culture of the manufacturing districts—has issued a scheme for her future History Tripos which resembles the table of contents to a revised edition of the Advergment of Learning. Efforts are being made elsewhere—notably at Eton—to prepare the soll from which so luxuriant a harvest is expected in the Universities. All this is well, or at least all this is meant well. But there is a process proliminary even to that in which the upper forms of public schools, or of schools of a higher "grade," as the phrase is, may engage with some hope of success. The very beginning has to be made; the very ground has to be broken up. In a word, before young men or boys can be introduced to the study of historical "subjects," or "periods," or both, they must be furnished with the means of acquiring that general rudimentary knowledge of history which is the indispensable foundation for any and every subsequent superstructure.

quent superstructure.

How to teach history to the young and ignorant is a question which we have no desire to discuss at length on this occasion with the shade of Mrs. Mangnall, or with any other practitioner. But certain conclusions will, we think, be readily conceded as not requiring proof. If a schoolboy or any other beginner is to learn with profit, he must learn it in a reasonable way, in a con-way, and in a way which will interest him. Otherwise nected way, and in a way which will interest him. Otherwise the pursuit will simply confound him, or delude him, or add to the many other inducements which already exist to give up the trouble of learning altogether. A boy who is merely ordered to get by heart a mass of names and dates might as well have been bidden to commit to memory a given number of pages of the Post Office Directory. The moral discipline is the same in either case; and the intellectual results will likewise tally. If, on the other hand, he is taught history in a more ambitious fashion, but still in detached bits, in unconnected sections—set, we will say, to read a handbook of English history from the Norman Conquest and another of Roman history down to the battle of Actium, with two supplementary pages bringing him on to A.D. 476—he may come forth, if he is lucky, the owner of two nicely-bound school prises, but he will certainly come forth the proprietor of a remarkably fast accumulated number of false notions. And, finally, if he is subjected to these or any other "methods" while no care is taken to awake in him an interest in his study, and to sustain it when awakened, he will ever after regard the study of history as a delusion and a snare, and will in later life infallibly confine his historical reading to those books which happen to treat of historical subjects, and which also happen to be forced upon his attention by Mr. Mudie and society at large as "books of the season."

But there is another side to the question of historical teaching, and that is the teacher's. He is not Mr. Freeman, though he has probably read Mr. Freeman's books—we man his big books. Even if he were Mr. Freeman, there would be a limit—though to be sure an uncommonly wide and the historical beauty. be sure an uncommonly wide one-to his historical knowledge. His most immediate object must be to satisfy at least the three demands enumerated—to see that his pupils understood what they learn; that they view history as what it is, a connected growth of which indeed all the connexions are visible to no eye, but which even the least experienced should from the first be prevented from treating as an agglomeration of disconnected atoms; and, lastly, that they are interested in it as in the knowledge of the doings of men and women who lived like themselves in a real world. To attain these ends the teacher also stands in need of aids, which (though in no case they can be uniformly satisfactory) must be sure, prompt, and invariably trustworthy. It is such aids as these for which he and his friends on his behalf have long, as we have said, been crying aloud. He has wanted books to place in the hands of his pupil or his class; he has wanted books which he might use himself as threads to keep together, and to keep in proportion, the oral explanations and illustrations necessary in order to interest boys in any subject under the sun—and most of all in one against which they have generally imbibed an hereditary prejudice— as being either too endless and too uncertain to be worth attempt as being either too endiess and too uncertain to be worth attempting, or too contemptibly easy to be worth taking trouble about. Books are often, and not always very correctly, described as "boons" to this or that class of people. A series of historical handbooks, textbooks, schoolbooks—the name does not matter—answering at the same time the modest but pressing needs of the teacher and the learner of the rudiments of history, was indeed a boon devoutly to be wished. It could not be the less such as boon devoutly to be wished. It could not be the less such as boan devoutly to be wished. It could not be the less such as coming from the hand of a distinguished historian whose more name was a guarantee for much at least of what was wanted being actually supp

Having said so much, we need hardly add how sincerely we wish success to the undertaking which Mr. Freeman has now in teral Sketch of European History His own admirable Ge hand. His own admirable General Stotch of European History supplies, precisely that general thread which such a teacher as we have described requires. Of its accuracy we can speak with something like certainty after a tolerably close examination; and its lustifity would strike any reader on the first perusal. But its object is of a peculiar kind—namely, we presume, to bind the whole series together, while in a manner supplementing each particular work; and the usefulness of the introductory easy will therefore have to be determined by the result of the settire series. It will stockably be read and explained—not, we hope, too amply—as an

introduction to the study of the particular Histories which succeeded or are to succeed it; but it will have to be received insponention to the study or the paracouse resources was succeeded or are to succeed it; but it will have to be ten again and again by both teacher and learner; and its more use will probably arise when after it has been mastered, or that particular History is in course of study, the Sketch is again and again employed by the teacher to see eye of the learner, and to reassure himself as to his own ou nwo aid or as ales

eye of the learner, and to reassure himself as to an commonwer over the bearings of his subject.

When we pass to the qualifications which are above all requisite in a particular History like that before us, we perceive the same necessity for that lucidity of arrangement of which the editor's General Sketch set the example, as well as for a constant attention to that general connexion of history of which it supplies the outline. Miss Macarthur proves equal to both these demands. From the point of view of the first of them, her tasks was comparatively easy. Scotch history, if its details are offer misty, is clear enough in its outlines, except at the beginning; if its misty, is clear enough in its outlines, except at the beginning; if its progress is, or at least was, slow, it is a progress under escertainable conditions and towards definite ends. When the bar has once conditions and towards definite ends. When the bar has once been crossed, and the Picts and Scots are left behind, it is all plain sailing; the difficulties as to the feudal relations between Scotland and England have no reality for any one who can appreciate the value of plain facts as well as Miss Macarthur; though, by the by, in page 37, in reference to the competition for the Crowin between Bruce and Balliol, she rather weakens the case in favour of Edward's—or rather the jury's—decision in favour of Halliol, by speaking of it as in perfect accordance with "modern" law-sailing ambiguous expression. The author has no difficulty in dividing speaking of it as in perfect accordance with mouern naw-an ambiguous expression. The author has no difficulty in dividing her book into periods which are real periods—not like, s.g. those into which books divide Roman history, teaching beginners to fix in their minds as an axiom the mistaken notion that the Roman constitution was revolutionized by the regifugium. The Gaulia constitution was revolutionized by the regifugium. The Rollid period, the English period, &c., are divided off by real revolutions; and if "the Jameses" seems an odd division, it is at least not a confusing one. Moreover, Miss Macarthur has very clearly summarized the results of each of these periods upon the main questions at the root of Scottish history—the relations between the races, these between Scottish and Freedand and Freedand. those between Scotland and England (and France), the establishment, consolidation, and tardy downfall of feudalism, and the religious views and systems obtaining in the land. Almost every one of these questions assumes a new aspect at particular points in Scottish history; and so with education, and even with commerce. All these points have, so far as we have observed, been clearly brought out, and not been obscured by the faintest attempt at time writing; there are hardly more than three inctaphors in the book. The diction is throughout straightforward and perspicuous; only now and then the author appears to struggle unnecessarily with the perfect tense; for she writes (assuredly with no eye to modern hotels), that the Highlanders "have at all times been much given to pillsging the more fortunate Lowlanders"; and, again, that the Orkney and Shotland isles "have never been redeemed by payment of the sum agreed on "by Christian of Norway—as if there will several more property of a diplement of propositions. still remained some remote prospect of a diplomatic proposition in that sense on the part of Paron Hochschild.

It might perhaps seem as if, under the second espect of the task, a School History of Scotland likewise presented no formidable difficulty. As Miss Macarthur reminds her readers in the very difficulty. As Miss Macartnur reminds nor readers in the very first page, Scotland "was never taken into the great Roman Empire"; and the solitary connexion which her history has with its system lies in her law, the origin of which might perhaps have been dwelt upon rather more fully than it has been in the brief reference which Miss Macarthur makes to the subject. The points of contact between Scottish and Irish history are—tho origin of the Scots excepted -- easily marked. The other countries belonging to the European system with whose history that of Scotland connects itself are (Norway apart) only England and France. The range of the elementary student's subsidiary reading need therefore in this instance not be wide, and Miss Macarthur has clearly indicated the several stages in the relations—which she rightly regards as most peculiar—between Scotland and France, while those between Scotland and England, as a matter of course, occupy a great part of her narrative. James I. (VI.) is attempts at union perhaps deserved a fuller notice; and we see no reference to the violent feeling against the Scots excited in England by the conduct of Lord Bute. But after Scottish history has become blended with English, it is not always easy to distinguish the currents in the common stream. Yet Miss Macarthur might have said something more of the part which the Scots have taken in colonization, though she has by no means overlooked the

Upon the whole, however, we have no exception of importance to take to this book from either of the points of view already referred to. Whether it has been made interesting enough as a parrative to be likely of itself to attract the elementary student, is a more doubtful question. The author has obviously felt under no obligation to insert anything which might be reparded as mere ornament; if there has been any struggle in her mind on the subject, the ornaments have, like Bruce's brooch, "come loom," and been dropped. Though she has found a place for Bruce's spider and one or two other old friends, she is in general as savers in manner, but by no means so protracted in length, as the Shorter Catechism itself. But why, if we may ask the question, were her limits so assrow? To put the whole History of Scatchad into one hundred and ninety-three duodecimo pages is no dont as difficult a task as to pass a rule through a ring; but what necessary was there for the rings being so very small?

We can, in short, see no reason why an excellent epitome like

that before us should not, while retaining its concise and summary character, have been warmed up and relieved here and there by additions likely to prove interesting to the beginner. Anecdotes and nicknames (what a genius, by the by, the Scotch have at all times had for nicknames!) are well enough; but it is not an increase in this direction that we desire. But why should Mr. Freeman and his coadjutors not permit themselves the introduction of brief aketches of character in certain instances, and of an element of local description in others? Why, above all, should the progress or decay of manners not be from time to time illustrated in appropriate passages? Moderation must be exercised as a matter of course; but let the poor schoolboy—leaving the poor teacher out of the question—be cheered here and there by something which will place him in more lively sympathy with his subject. The memory of John Knox is dear to Miss Macarthur; why should she not have indulged her readers in half a page bringing the man before them? The character of James VI. no schoolboy will forget in its broad outlines (which there is plenty of first-hand evidence to sketch with certainty) when he has once that before us should not, while retaining its concise and sumof first-hand evidence to sketch with certainty) when he has once become acquainted with it; why pass by the opportunity in half-a-dozen tame lines? And if the names of men of letters are to be mentioned at all, what use is there in flinging at a schoolboy's head "David Hume the infidel philosopher," of whom it is merely said that he was "born at Edinburgh in 1711," and "is best known at the school of the as the author of a popular but untrustworthy History of England"? Characterization, whether of men, manners, or places, is possible within very narrow limits of space.

It is readless to offer any further second to the control of t

It is needless to offer any further suggestions, as our meaning has, we hope, been made clear. This Series is sure to succeed, and to fill part at least of a terribly aching void, if the several Histories are made a little more interesting than the one before us. This are made a little more interesting than the one before us. This will be easily accomplished by writers so competent and so capable of self-control in the execution of a difficult task as Miss Macarthur has proved herself to be, if a little more "law" (to use a school-boy's term) be allowed. The following volumes of this Series will therefore, we hope, be a little longer than this History of Sectland. Due proportion will no doubt be preserved; and we should be glad if a recommendation which we should certainly refrain from making in the case of nine out of ten elementary historical series should contribute in any degree to the success of the tenth, which in many ways promises far better than any other with which it is our fortune to be acquainted.

ARCHDEACON FREEMAN'S DISTORY OF EXETER CATHEDRAL.

THERE seems to be some special gift of fruitfulness about the city of Exeter which enables it to keep us in a never-ceasing supply of local literature, and also in an unusual amount of current events which call for notice. The present book, a history of the cathedral church by a member of its Chapter, though its preface bears date as long ago as last August, has reached us only now, in this season of suspense, while we are waiting to know whether the reredos for which we presume that Archdeacon Freeman is responsible along with his brethren is to be looked on as idolatrous or not. We believe that the Archdeacon's is the first attempt since these matters have been at all understood to give anything like a scientific account of Exeter Cathedral. If the Archdealogical like a scientific account of Exeter Cathedral. If the Archeological Institute could have been persuaded to go to Exeter in its earlier and more vigorous days, the church would doubtless have had its history worked out once for all by Professor Willis in the same style as the famous monographs of Canterbury, Winchester, and York. But, as this was not to be, we thankfully accept what we have got from Archdescon Freeman. It would be flattery to place the Archdescon on a level with the Professor, whose combination of gifts, his knowledge alike of construction, of architectural detail, and of documentary evidence, together with a power of exposition which has never been surpassed, sets him above all competitors. Not but what there is one side in which the Archdescon has, we think, the advantage. With all Professor Willie's wonderful power of combining the evidence of written history with the evidence of the existing buildings themselves, history with the evidence of the existing buildings themselves, he never seems to care for any history of a building except a history of the stones of which it is built. With all his knowledge of architectural detail and architectural construction, he never seems to care for a building strictly as a work of architecture, having a certain artistic character, and worked out more or less successfully according to a certain artistic design. It may be that he has always thought it his duty strictly to keep himself be that he has always thought it his duty strictly to keep himself within his own special range of combining the evidence of documents with the evidence of construction, and that he holds that any purely historical or purely artistic views of things are beyond his tether. But the lack of any considerations of this kind always give an air of something lacking to any discourse of Professor Willis. The thing is perfect as far as it goes. It works out all that can be done within its own range, but its range does not take in the whole of the subject in hand. Archdeacon Freeman, without reaching the Professor's strength or the Professor's clearness, without his exceptional power either of finding things out or of setting forth what he has found out; does in his way take a wider and worthier view of the matter in head than Professor Willis does. He sees that the architectural history of a church, though distinct from the history of the floundation to

3.3

which the church is attached, is yet something more than the list-tory of its construction. Archdescon Pressum too is qualified for the work he has taken in hand by long study of at least ling-lish ecclesiatical architecture, and by an intimate personal said official knowledge of the building. So, as there is no hope of anything from the great master, we are glad to get what we can from a disciple who has at least striven to walk in his path.

Exeter Cathedral is noted among our great churches for several things. It has an outline shared by no church in England, save its own miniature at Ottery, and by not many elsewhere; that is, the absence of either western or central towers, while where the pair of towers form the transepts, after a mannor which Archdescon Freeman reverently compares to two hands lifted in prayer, but which irreverent people say gives the church the look of a paddle-steamer. Archdescon Freeman says that this arrangement is known to exist in three Continental churches only; the metropolitan church of Lyons, and the cathedral churches at Châlons and Geneva. Lo Mans he shuts out as having only a single tower. But Lyons differs from Exeter in having western as well as transept towers; Châlons has not exactly transept towers, but towers east of the transepts, as in so many German churches and in the church of Nôtre Dame in Châlons itself; and, if Le Mans has now only one tower, it once had two. Archdeacon Freeman can hardly have been at Le Mans, or he would remember one of the most living tales of the eleventh century; how Bishop Hildebert was constrained by William Rufus to pull down the two the most living tales of the eleventh century; how Bishop Hildebert was constrained by William Rufus to pull down the two newly-built towers of his church, and how the northern one has remained from that day to this a ruined stump. Altogether the closest parallel to Exeter is Geneva. Another point at Exeter is that it forms a link between our Romanesque and our Gothic buildings. At Peterborough and Norwich the earlier style prethat it forms a link between our Romanesque and our croums buildings. At Peterborough and Norwich the earlier style prevails; at Wells and Salisbury we have only the later. At Exeter we have a Gothic body with, so to speak, Romanesque wings. And mark again that the Romanesque of Exeter has a history of its own. As at Wells, the Old-English church survived longer than usual. For one reason, it was nearly new at the time of the Conquest. Bishop Leofric, who survived William's coming several years, could hardly be expected to pull down the church which he had himself built. The next Bishop. Osborn. a Norman who had come in under Edward, Bishop, Osbern, a Norman who had come in under Edward, identified himself with his adopted country, adopted the manners and feelings of an Englishman, and, we are expressly told, abstained from destroying his predecessor's works. The remodelling of things was therefore put off at Exeter, as for other causes it was put off at Wells. Neither of those churches had any share in the first great impulse of rebuilding in the days of the Conquest, the impulse of which we see the fruits at Winchester and St. Albana. Their turn did not come till a generation later, in the days of Henry the First; in the case of Wells oven later. Only at Wells there is no visible trace of the Norman work any more than of the Old-English—though they once did exist nevertheless—while at Exeter the transept towers of the church built or begun by William of Warelwast are still there to speak for themselves. They are, as Archdencon Freeman says, in a plain style of Norman, but still they are not at all in the same early style as the buildings raised immediately and the Comments of the same are not at all in the same early style as the buildings raised immediately after the Conquest. Another special point at Exeter is that the whole church except the two Norman towers was rebuilt, or rather, as Archdeacon Freeman insists, recast, at a time reaching from the later years of the thirteenth century through a large part of the fourteenth, and that from one general design. It therefore gives us one of the best lessons in the gradual progress of art during that time, and especially in the development of the window tracery of the time, of which we may safely say that Exeter supplies us with the most perfect study to be had anywhere. Furthermore Exeter is, whether we count it for a fault or for a merit, the only English church on a great scale which, owing to the utter absence of any central lantern of any kind, can show a centinuous vault running uninterruptedly from east to west. In all these ways Exeter Cathedral is one of the churches in all England which is best worth studying. Few have so many striking features peculiar to themselves; but, looking at the building as a whole, as a work of art, we are not sure that we rate it quite so high as the Archdeacon dess. not sure that we rate it quite so high as the Archdoncon does. We never could bring ourselves to admire the side towers and the long unbroken roof running between them. We must confess that the towers much oftener make us think of the paddle-boxes than of the hands lifted in prayer. The church has in fact no outline. If it was not to have the common English and Norman outline, one might have looked for something of the German outline which the side towers do indeed suggest. The Archdescon indeed holds that the church had, or was mannet to have make the towers as well as the the church had, or was meant to have, western towers as well as the side towers; but we do not see that he makes out this point at all certainly. And if it were so, the huge side towers with smaller western ones would have made a very strange outline quite different from the German outline of an eastern and western pair of towers, like Trier and Hamberg. Then again the church is low inside and out, and inside its continuous roof makes it look still lower. The break of inside its continuous roof makes it look still lower. The break the lantern would have been a great gain, and would have add much to apparent light. The Archdescon compares it, with equally unbroken roof of King's College Chapel. Her King College Chapel is a building which stands quite by itself, want body, without aisten, transcots, towers, breaks of any kind. I roof is unbroken, because everything about it is unbroken; and internal height of King's College Chapel is in about a several fashove that of Eigeter Cathedrall. And, passion college and the conquent high appraisant point of the wealth give will greater on quent high appraisance point of the wealth give will greater on orioni as it may

The Architectural History of Exeter Confederal. By Philip Free-man, M.A., Architectural Canon of Exeter. Exeter: Eland. London: Bull & Sons.

parentite height to the helicites. What is really to be educated at Expire, to be admired as a matter of art as distinguished from the singularity of its history, is the perfect and enquisite finish of all its finish. It would be very easy to find work which is richer; it would be hard indeed to find work which is better.

it would be hard indeed to find work which is better.
Architector Freeman successfully points out come of the minconceptions of the earlier local writers, and shows very plainly that
the side towers were always meant to be side towers as they are
now, and that there is no ground for the belief that they once were
the towers of a west front. If so, they must have been towers
beyond the sides, like those at Wells and Notre Dame at Rouan.
But there is nothing to lead us to think that this was the case.
The towers are quite unsuited for any such purpose; it is inconceivable that William of Warelwest could have built his whole
church to the east of them, and, what settles the matter, parts of
the Norman work have been clearly made out to the west of them.
William was a man who had seen a good deal of the world; he
had been on various missions during the dispute between Henry I.
and St. Anseim, and he may very likely have caught the idea from
something in Germany, France, or Burgundy; he certainly could
not have learned it from anything in Normandy or lingland.
According to Archdescon Freeman, the Norman church which
Bishop Williams began went on with some interruptions through
the rest of the century, and was finished by Henry Marshall, Bishop

According to Archdescon Freeman, the Norman church which Bishop Williams began went on with some interruptions through the rest of the century, and was finished by Hanry Marshall, Bishop from 1194 till 1206, who not only finished his predecessor's work to the west, but enlarged it to the east, by lengthening the choir and adding a lady chapel. After this little or nothing happened affecting the fabric of the church itself till quite the end of the thirteenth century. Then Peter Quivil, Bishop from 1281 to 1292, began what the Archdescon calls the transformation which went on under his successors, Thomas Button, Walter Stapleton, and John Grandison. We have said that the Archdescon's great point is that the church was simply transformed—that is, that the Norman building was not even gradually palled down and another built on its site, but that it was simply recast without pulling down. If so, the work was most ingeniously and thoroughly done, but the very ingenuity and thoroughness of the work almost cuts it down to a piece of local antiquarian history. For the Norman work in no way affects the character or proportion of the work into which it was changed. In Gloucester choir the Norman work is not even recast; it is simply overlaid with Perpendicular. In the nave of Winchester and in the choir of Sherborne, as compared with Canterbury and St. Mary Redeliff, we see the difference between recasting and rebuilding. The earlier work clearly affects the proportions of the new, and at Winchester bits of the earlier work actually peep out. But at Exter no one would think that the exquisitely designed Decorated work was a mere recasting of Romanesque. Though the church looking cast and west is low, yet the arcades, taken bay by bay, are about as perfect in their own kind as they can be. Their proportions do not seem to be in any way affected by those of an earlier building. Some may wish for a larger triforium, and, as giving greater height, it would so far be a gain; but it is in no way needed by the bays themselves,

MARTIAL'S TREATISE ON ETCHING.

A MONG the artistic signs of the times may be counted the multiplicity of treaties on etching; and that it is not merely a passing fashion amongst amateurs, the serious cultivation of the art by many accomplished artists and the formation of schools of etching, as we have schools of painting, sufficiently prove. The most recent Continental fashion in matters connected with the fine arts is for collectors of pictures to have their collections etched for sumptuous illustrated catalogues, which serve as presents to the collector's friends, and at the same time make the collection known to the public, thereby increasing its future value in the market. It is curious that so old an art as this should be revived in such strength immediately after the remarkable photographic discoveries of the present century, and the reader who is only partially initiated into artistic matters may naturally feel inclined to ask if it would not be at once cheaper and more satisfactory to have galleries reproduced in photographic autotype. There are, however, two great objections to the autotype processes as a means of reproducing pictures; one objection is that photography does not tender that the printing processes are not very transtworthy. In many old pictures much of the work is in a degree of obscurity not always easily penetrable, and yet the charm of the picture is entirely dependent upon some perception of the forms and details that are to be discovered in the obscure passages by a keen-sighted and intelligent spectator. Photography generally readers these photograph happens to be defective, the blot is more uninteresting still. And even if photography were as perfect as it is important, there would still be a distinctly independent pleasure in observing

bow an intelligent interpreter translated the picture into block and white. The owner of a pullery that is engraved may find visual, and intitud if the engraving is badly done, but there is a presider pleasure in the enjoyment of in idelity when it is at the same time both skilful and intelligent. To study an exclude finance picture that we know, when the etching has been done by some quite first-rate artists such as we derive from the reading of an adminstration such as we derive from the reading of an adminshed critical exposition of its merits. The etcher tells us quite plainly with his point what were the delicate artistic qualities, that he perceived in the printed week before him; and it has certainly not too much to say that for any student of art sufficiently advanced to take in teaching that is not expressed by words, such a plate as the "Reguest" by Julea-Jacquemart, after Nicolea Rerghein, contains as much critical instruction as an essay by Burty or Charles Hanc. The very liberty of etching adds greatly to its force as an exponent of the qualities of painting. Any one who knows how an atcher holds his needle and how a passer holds his break will perceive that the two instruments are much neasur skin is their manner of action than the burin is to either. An etcher who has perfect sympathy with the painter he interprets can convey a very clear notion of his manner, and can make you feel that the painter had a light hand and a brilliant touch, or a firm and solid manner, as the case may be. The etching by Jacquemart just referred to be an excellent rendering of Herphen's manner in oil. The success of several Continental etchers in this direction, especially of Flamony and Unger, has rapidly formed a school of accomplished men whose earlier art education had been that of painters or engravers; and now it may fairly be considered that etching has wen the battle which it was waging against public indifference from ten to twenty years ago. It is now as popular as an art so purely artistic can be expected t

El bien ! la compuée est faite ! L'enu-firte, presque abandonnée depuis la dix-huitième secle, est redevanue une des expressions da l'ert français. Elle compte désormas comme une spéciaire qui es classe dans les expositions, et qui passionne déjà les curieux et les collectionneurs.

This is quite true, and the artists who have affected this result deserve credit for their courage and perseverance. The revival of an art so nearly extinct as this was can never be a very easy matter since the chain of tradition is interrupted. Now that the revival is fully accomplished, and that we have etchers in our own time who are as skilful as the very greatest of formor days, whilst they are numerous enough to form a school and help each other by mutual criticism and assistance, we may easily forget what up-hill work it was to learn the art over again from the works of the old masters. Something of the credit of this revival is due to M. Martial himself, the author of the book before us. He has been a skilful practical etcher for many years, and has produced a great number of clover places which must have done something to make the art popular in Paris. It strikes us as rather remarkable, howthe art popular in Paris. It strikes us as rather remarkable, however, that, although M. Martial appears to be practically so well qualified to give instruction in stelling, he should have written a treatuse which is decidedly less complete than the one published several years ago by M. Lalanne; and this is the more surprising since in technical literature of this kind the latest writer may easily supersade his predocesors, and generally endeavours to do so. 'Il Murtial's treatme not only does not take any note of several improvements which have been adopted. improvements which have been adopted very generally, but it does not even preserve the tradition of some processes which were in use in the time of Rembrandt. For example, Rembrandt was acquainted with the use of the dry point and with relating, yet M. Martial explains neither. He ignores all modern improvements in the mass, probably not having adopted them in his own pracin the mass, probably not having adopted them in his own practice; and yet many of these improvements have the practical sanction of some of the most eminent living stehers, who have gladily adopted them. We may reasonably complain that M. Martial is so conservative as to ignore entirely the useful modern practice, which the photographers taught us, of grounding a plate with liquid varnish as they do a glass with colloidon. There are several liquid grounds in constant use by different artists—the chloroform ground, the other ground, and the solution of wax and Japan varnish in turnentine. Some of the most exof wax and Japan varnish in turpentine. Some of the most ex-perianced and most practical etchers of the present day use and prefer a paste made of etching-ground and essential oil of lavender, of the consistence of pomatum, and applied with the rouless & reverser, which M. Jacquemart has not mentioned. The old system reversity, which M. Jacquamart has not mentioned. The old system of melting the etching-ground on a hot plate, and spreading it by means of a dabber, is much less perfect and much more liable to inequalities than either the liquid grounds or the peaks, although it is quite possible that an etcher like M. Martial, whose practical skill we do not call in question, may still prefer the dabber from old habit, and from a dissuclination to adopt new mathods, which of course always require a brief appearaticalisy for their perfect mastery. In the old treatises, such as that by Mr. Alfred Ashley, the dabber is recommended of course, because at that time no other way of spreading an etching-ground was known. We may add that it is impossible with the dabber to spread a black ground on a plate already etched upon without hiding the finest lines, whereas with the paste and roller the ground may be so thin that the faintest scratch is as distinctly visible as it is through the steat that is applied galvanically—an immense advantage when work line to be added.

^{*} Mouseum truité de le granure à l'asseffère, pour les pantres et les dessinateurs. Parle : Cadari. London : Dulan & Co.

Writers of such treatises as this, which find their sale almost entirely amongst amateurs, are uniformly rather culpable in one respect; they readily yield to the temptation to represent their art as being easier than it really is. The reason for this degree of polite misrepresentation is obvious. To say plainly in a treatise addressed to amateurs that the fine arts are so terribly difficult as all of them are in reality, that they require the whole strength of gifted men and the labour of many years for success in them, would be to discourage the very class of people for whom the book is intended. It is essential that the amateur should not be deterred by hard statements of difficulties which are pretty certain to be inintended. It is essential that the amateur should not be deterred by hard statements of difficulties which are pretty certain to be insuperable in his case. This book is preceded by two short introductory papers by MM. Bürger and Théophile Gautier, which, in very pretty and graceful physes, tend to keep up the illusion. These papers are not new, being reprinted from the old publication of the Société des Aquafortistes, to which they serve as prefaces, but they are so agreeably written that it was a happy idea to preserve them in this place. Both MM. Bürger and Gautier write as if any artist might etch who liked, and M. Martial himself does the same. In describing the state of feeling on the subject does the same. In describing the state of feeling on the subject forty years ago M. Bürger says:—

On y accrochait contre les murs quelques pièces d'Ostade et de Paul Potter, ou de Van Dyok et de Fyt, ou de Claude et de Callot, ou même de Goya, mais il semblait que ce fut une terrible affaire que la préparation des plaques, et les procédés de l'eau-forte.

The people of that time, if they thought that etching was a difficult business" (as David Cox said of water-colour), were much nearer the truth than our contemporaries who fancy that it is easy. Here is another passage in the same sense:

Nons pouvons nous rappeller une époque, pas bien éloignée, où la pratique de l'eau-forte effrayait encore les maîtres les plus audacienx. Eugène Delacreix s'y est risqué par caprices; mais combien a-t-il laissé de pièces? Une douzaine, à peu près. Et combien a-t-il laissé de dessins? Plusieurs milliers. Quel malheur qu'un génie d'une telle abondance n'eût pas jeté ses improviactions prestigieuses sur une feuille de métal au lieu d'une feuille de papier.

M. Bürger seems to believe that, if Delacroix had drawn on metal instead of paper, he would still have produced his many thousands of designs; that he might have done as many etchings as he did sketches. But the mere preparation for an etching would have taken as much time as a sketch on paper, and would probably even have included a sketch on paper; and then the biting?—and the stopping-out?—and the proving of the plate?—and the retouching and the rebiting? It may be affirmed without hesitation that an etching rebiting? It may be affirmed without hesitation that an etcning on copper takes ten times as much time as a sketch carried to the same point on paper, besides which it is much more difficult to do. The etchings that Delacroix did execute were very poor etchings indeed; and he probably felt no encouragement to give the time which would have been necessary to attain a satisfactory skill. M. Théophile Gautier speaks of etching as "rapide et facile." Well, it is facile in the sense that there is no material attained in stehing as there is in engraving with the burier facile. facile." Well, it is facile in the sense that there is no material resistance in etching, as there is in engraving with the burin; facile in the sense that there is little material friction, just as modelling in clay is more facile than carving in oak or stone. But what are these material hindrances in comparison with the artistic difficulties of master-like drawing and light and shade? And yet even in stching there are material difficulties that try the patience of the most experienced; and M. Martial's work leaves the reader wholly unprepared for these. Mordants are not always to be depended on throughout the whole process of hiting; they will sometimes stop biting quite unaccountably, as it seems; and instances occur when all the stopping-out and subsequent bitings are labour lost from the capriciousness of the said. The oldest and most experienced otchers complain of this; and they also sometimes complain of the the capriciousness of the acid. The oldest and most experienced otchers complain of this; and they also sometimes complain of the inequality and irregularity of the acid's attack upon the copper when first the biting begins—a very serious inconvenience indeed, for it often makes the pale tints exceedingly difficult to obtain.

Of course these difficulties and uncertainties are not sufficient to

make any persevering man abandon an art which has so many great qualities to recommend it; but they occasionally perplex and hinder very accomplished artists. A clever man will always get his plate right in the end, because copper admits of almost endless retouching and correction. In saying this, by the by, we find ourselves in direct opposition to M. Théophile (Fautier, who affirms that atching "na acuffre nas les tâtonnements les retouches les reetching "ne souffre pas les tâtonnements, les retouches, les repentirs." This is poetical imagination, the plain truth being that some of the best etchers proceed entirely by tatemments and retouches, whilst we have abundant evidence of repentirs in different states of of the best etchers proceed entirely by tatemments and resources, whilst we have abundant evidence of repentirs in different states of plates by great masters who have passed away. Gautier affirmed, too, of etching, that "ce qu'elle ne peut rendre, heureusement pour elle, c'est la fausse grâce, la propreté niaise, le lisse, le ratissé, le flou, le mollasse, le blaireauté, et toutes ces recherches de soin et de patience qui causent tant d'admiration aux philistins et aux demoiselles." Alas! we fear that etching has been only too successful in these various false directions. Many etchings are published which have all these vices except le blaireauté, and as near an approach to that as is possible in an art where the blaireaut is not used. Gautier, however, was a poot, and seldom hesitated about using hyperbole. There is a wonderful instance of this in his little essay prefixed to M. Martial's book. Wishing to convey an idea of the serial lightness and delicacy of which etching is capable, he says, "Que de mouvements primesautiers a conservée cette rapide et facile gravure, qui sait immortaliser des croquis dont le papier ne garderais pas trace!" This means that you may sketch ac delicately on copper that, if you sketched with equal delicacy on usper, the lines would be invisible. We need hardly observe that this is not true. The degree of pressure necessary to clear away

100

etching-ground properly is enough to produce visible and lasting marks on paper with pen or pencil. The idea of extreme facility is maintained by M. Martial himself, who says, "Veici les moyens faciles et prompts, qui permattront à tout peintre ou désiliateur de s'en servir utilement et de publier see essais"; and again, "En somme, ceux qui savent desainer doivent réuseir immédiatement l'ean-forte." The truth is that, although in order to steh it is necessary to be able to draw, it does not follow that every good draughtsman is able to etch. Many good draughtsmen have tried to etch, and failed decisively, because their art of drawing was not of a kind which forms an etcher.

M. Martial has entitled his work "L'eau-forte des rejutres et dessinateurs," as a distinction from the etching of engrivers. It may be observed in reference to this, that etching holds a much more important place in what is popularly called engraving shan is generally imagined. For example, the large plates after Ross Bonheur by Mr. Charles Lewis, Mr. Ryall, and Mr. Thomas Landseer, though the public admired and bought them as "engravings" at a time when it looked upon etching with comtempt, are in reality etchings on a machine-ruled ground, small parts only being worked with the burin. These, however, are engraver's etchings, and very wonderful things they are too, in their own way, but it is not a painter's way, although they interpret painting so efficiently. It may be observed also that the works of the new school which interprets pictures in etching are not recognized as etchings by the public outside of art, and even our of the new school which interprets pictures in etching are not recognized as etchings by the public outside of art, and even our principal newspapers sometimes speak of them as "line engravings." M. Martial no doubt desires to help forward the free, spontaneous, unprofessional kind of etching which has often been practised by accomplished painters, and in this desire he must have the sympathy of all who can appreciate genuine and direct expressympathy of all who can appreciate genuine and direct expression. Let us add, however, that the productions of the last few years do not encourage us to hope much from any general effort in this direction. The peculiar sort of talent which belongs especially to Mr. Haden, and which is the inborn gift of the true etcher, is evidently one of the very rarest gifts among the artistic faculties, and without it all attempts in that direction are only so much waste of effort. It is the talent of felicitous selection suggested by passionate feeling, and how are you to teach anybody that? The sort of etching which now promises to be generally satisfactory, but satisfactory in quite another way, is that which satisfactory, but satisfactory in quite another way, is that which Flameng's school is practising, and which depends much more upon science, intelligence, delicacy of observation and of hand, than it does upon any passionate inspiration.

We have met with an amusing instance of the way in which we have met with an amusing instance of the way in which professional authorities sometimes contradict each other. Here are the opinions of Mr. Alfred Ashley and M. Martial about the operation of strong and weak acid—a matter on which, from the extreme facility of making experiments, we should hardly have thought it possible that there could be two opinions:—

r. The great fault in using acid too weak is that it bites the line broad and shallow, thus causing it to print brown or sooty; on the contrary, with the acid strong, it acts immediately upon the copper, bites a deep line, which prints black, and renders the re-biting a comparatively easy task, it being next to impossible to lay a re-biting ground with the lines shallow.

—The Art of Etching. By Alfred Ashley. P.7.

2. If ne faut pas avoir peur de l'acide; léger, c'est à dire très étendu d'eau—il creuse à la longue sans élargir le trait; vif, c'est à dire presque pur ou peu étendu d'eau—il élargit et ronge la taille et le vernis dans tous les sens.—Martial, D. Az.

Martial, p. 41.

We are sure, from careful practical experiments, that M. Martial is right in this instance. He ought, however, to have mentioned

We are sure, from careful practical experiments, that M. Martial is right in this instance. He ought, however, to have mentioned the Dutch mordant, which enlarges less than any other in proportion to the depth of its bitings. A Frenchman never knows what is done outside of his own country, so that one would not be surprised if M. Martial were ignorant of this mordant so long as it had only been used in Holland, England, and America; but it is now employed also in Paris. It is most valuable for its steadiness and absence of ebullition, though an etcher who uses it may still like to have nitrous acid in his laboratory when he wishes to enlarge his lines.

The illustrations to this handbook do not call for particular comment, being simply done for the biting, and they do not represent M. Martial as an aquafortist. Two of the plates have been transposed, which creates confusion; that which is marked 11 and placed opposite page 44 ought to have been marked 12 and placed opposite page 46, and rice vered. The book confines itself entirely to the technical process, and nothing is given to illustrate the artistic uses of the etching-needle, a point which was not neglected by Lalanne. M. Martial's literary style is very well adapted to writing in which brevity is an object. It is as direct and clear as possible, but all in staccuto. Here is a good specimen of it:—

Il est désirable que les peintres et les desinateurs—sans exception— l'étudient. Ceux qui se passionneront pour elle, en feront un grand art— bien français ; les autres vous donneront au moins l'image—l'image—qui vaut le tableau, qui peut se répandre—celle qui élève—frappe et touche autant que le Livre!

TO ROME AND BACK.

IT is impossible to congratulate Mr. Capes upon the form into which he has thrown his Apologia. The serious and the lively parts of To Bone and Back do not blend happily together, and the liveliness of the latter is little better than deadly-liveliness. The imaginary Mr. Seymour of St. Bede's, who talk the story, almost drops out of sight when Mr. Capes comes to describe the real

^{*} To Rome and Buch. By the Rev. J.M. Capes, M.A. London : Smith, Elder, & Co. 1872.

changes which his opinions underwent, first in the Chusch of England, and afterwents in the Church of Rome; and the earlier chanters, in which there is some attempt to maintain his imaginary personality, seem to have been put in rather because a convert must in the asters of things have had his mind unsettled at Oxford than because Mr. Capes has any clear recollection that his own mind was unsettled there. The account of his here's Oxford career takes up nearly half the volume, and at the end of it he is made to say, "I left Oxford after taking my degree, and entered on my clerical duties without the alightest misgiving as to my duty in remaining a member of the Church of England. . . I was still a thorough Protestant." Mr. Capes must therefore be supposed to think his sketches of Oxford life worth preserving and printing as illustrations of a remarkable religious movement, and in that case either his recollections are singularly unfortunate or his imagination singularly unsuggestive. What can be said, for example, of such a passage as this? The speaker is a Tractarian his imagination singularly unsuggestive. What can be said, for example, of such a passage as this? The speaker is a Tractarian

"I assure you, Winston," he continued, "that the movement is growing in the most astisfactory manner. I was never more pleased than I was the other day, when I went to take duty in a terribly Evangelical neighbourhood, and happening to go into a very neglected little church, there I saw two young ladies and their brother—all upon their knoes in the chancel—making a rubbing of one of the finest fifteenth century brasses I ever saw. It was a most Catholic sight. Their hands were all black with the cobbler's wax, and their drasses tumbled and dirty, and I was glad to see so much self-denial in the grood cause."

elf-denial in the good cause."

"I confess that I scarcely like this passion for brasses," observed Winston; one cannot but fear that it leads to a good deal of irreverent conversation

in sacred places."

"I trust not," Yorke answered. "Young people cannot fail to be seriously impressed by the features of the venerable bishops and pious laymen which they are transferring to paper; and much Catholic doctrine must be insinuated by the deciphering of the legends which surround them."

This and some similar speeches from a Tructarian Undergraduate, who, by the way, makes rather a happy comparison between the Royal Arms which used to adorn the gallery front in many churches and the Cherubin in the Jewish tabernacle, seem to be the only things that made any impression on Seymour's mind. If Mr. Capes's here is a true representation of himself, he must have an extraordinary gift for discerning the small side of great move-

When Mr. Capes comes to business it is fair to say that his book improves a good deal. The reasons which led him to leave the Church of England seem curiously insufficient, but his account has at all events the merit of being fair to views which he no longer holds. First of all, he found himself puzzled to explain why he had become a clergyman. The Erastian theory, according to which the Christian ministry is one of the functions of a national communion, which he had accepted in the first instance, seemed to lack the countenance of the New Testament. The Evangelical theory, which makes the Church a mere combination of individual pious men and women, struck him as equally wanting in this respect. Consequently he was thrown back, by a process of exhaustion, upon the dogma of the Apostolical Succession. Dr. Pusey's tract on Baptism gave him a new view of the nature of the Apostolic teaching about the Sacraments, and Dr. Nowman's argument that Nicene Christianity could not by any possibility have developed into modern Protestantism completed his aliena-tion from the system in which he had been brought up. Upon this state of mind there supervened two new protections, the internal divisions of the English clarge and the approximate units of Lorse divisions of the English clergy and the apparent unity of Rome. It is strange that a man who had only just arrived at a wholly new set of beliefs should have thought the fact that everybody else had not made the same leap at the same moment an argument against the claims of the Church of England. On any theory the Tractarian movement was a reforming movement, and all reforms contemplate a stock of unreformed material to be worked upon Mr. Capes, however, found it indispensable to his spiritual comfort to be a n a communion in which there was an absolute identity of belief, and apparently an absolute identity of belief down to the minutest points. From this the step to the conclusion that without a living points. From this the step to the conclusion that without a living infallible teacher there can be no real revelation was short and easy. He made up his mind to be received into the Roman Church, and "felt a sense of unquestionable relief." His new-Church, and "felt a sense of unquestionable relief." His newfound comfort lasted but for a short time. He was soon "brought face to face with the painful truth that in Rome, as in England, human infirmity was triumphant in the most professedly saintly bosoms." If Mr. Capes had been a young lady of seventeen, the expectation he seems to have entertained that the Roman clergy were exempt from human frailty would have been sufficiently natural. In a man who had been ten years or so in Anglican orders such simplicity, if equally amiable, is not equally intelligible. Before long the tremendous truth began to disclose itself. Agreement upon a certain body of theological balief did not turn out to be incompatible with very violent differences upon matters lying outside it. One order of monks was not always on good terms with another order; rivalry between the regular and the secular elergy was not unknown; Oatholies belonging to different artistic schools often waxed hot in controversy; and the result of all this was that Mr. Capes found that there was nothing for it but to enter upon a dispassionate re-examination of the doctrine and claims of the Roman Church.

This is not the place to examine the details of this theological process. It resulted in a conviction that the Roman Church had no better title to respect than the Anglican, that both were human institutions of exceedingly mixed sharecter, and that, inassunding this view of her, there was nothing to be done but to acquisece in found comfort lasted but for a short time. He was soon "brought

this view of her, there was nothing to be done but to sequiesce in

scolosisatical isolation. The fact that he had been dissectanted with the Church of his adoption did not alter the fact that he had first been disenceated with the Church of his birth. His sonclusion that Anglican pretensions had no foundation in theological or historical truth was in no way affected by the later conclusion that Roman pretensions were just as groundless. Mr. Capes describes his feelings while this state of isolation lasted with eloquence and sincerity. He is not equally successful when he course to explain his reasons for returning, after many years dalay, to his old communion. His attitude towards Anglicanism has undergone no change, but in the Established Church of England he thinks he sees something greater than Anglicanism, and to this something he is content to devote "what now remains of a life so much of which has been exhausted in the storms of controversy." The English Church, says Mr. Capes, "is simply the institution through which the English people, speaking through a Parliamentary majority, repeats Sunday after Sunday, and day after day, its own interpretations of the Hible and its hopes of an eternal life to come." Consequently the fact that contradictory doctrines are openly taught by clergy who pray in the same churches, sign the same declarations of assent, use the same prayers, and observe the same ascramental rites, is, in Mr. Capes's opinion, an additional reason why he should work with and among them. There is, as he proudly says, no other Church in the world in which there are such internal differences; but then no Church which comprised fewer or less vital differences would adequately represent "the lengthing with an among them. There is, he has proudly says in the intelligence and religious views of the English virtual and an one of the English of the english can be a such as a such as a such and religious views of the English virtual and an one of the English virtual an scolomestical isolation. The fact that he had been fewer or less vital differences would adequately represent "the variations in the intelligence and religious views of the English people." The want of unity which was once a motive for leaving the Church of England is now a motive for remaining in it. If the the Church of England is now a motive for remaining in it. At the clerry as a body agreed upon any one matter of doctrine or ecclesiastical practice, they would not, he thinks, be suitable ministers of religion in a country in which, more than in any other in the world, "opposite beliefs are held with practical earnestness by educated and uneducated men alike." Mr. Cupes confesses that he regards such a Church as this as a marvellous anomaly, but he declares neve theless that he knows of no other religious community which exercises so healthy and powerful an influence in preparing those who own her sway for the awful moment of death. What the exact nature of this preparation is, we are not distinctly told, and it is certainly conceivable that when the awful moment in question comes, the value of a Parliamentary majority as an organ of religious expression may prove to be less than Mr. Capes believes. The most valuable part of Mr. Capes's book is undoubtedly the un-

designed antidote which it administers to Protestant uncharitableness. He has no love for the Roman Catholic system, but experience has convinced him that, in England at all events, its faults are not those which popular bigotry attributes to it. The Roman idea of worship he still holds to be "in some respects more philosophical and practical than the ordinary Anglican idea of common prayer."
It encourages an amount of individual liberty which is unknown among Protestants, but which is essential, or at least most important, to the offering of a purely spiritual worship by a miscellaneous con-gregation. Transubstantiation he now regards as false and illogical, but he pronounces that it is "no more idolatrous than is the belief that God died upon the cross upon Calvary." The popular notion that English Romanism is not a spiritual religion, he thinks too absurd for serious refutation. "I have long come to disbelieve its claims; but I know that it is no more a more mass of idolatries, superstition, and formalism than is the Church of England itself." The abuses often attributed to the Confessional exist in this country only to a small extent, and in this matter "the Jesuits are almost absolutely blameless." Statements of this kind, when they come from men who speak with knowledge derived from experience, and with an obvious absence of any bias in favour of the persons in whose behalf their testimony is given, must have some induence in breaking down that wall of theological prejudice which divides one section of Englishmen from another. We have not been able to discover any reason why Mr. Capes should have taken the public into his confidence as regards the reasons either for his first or for his second change of faith. But, as he has thought fit to do so, it is satisfactory that he should have written nothing calculated to increase the mutual enmity of the two communions to which he

has successively belonged.

AN OLD-WORLD DUEL IN HEXAMETERS.*

T is to be regretted that some capable person with sufficient leisure does not attempt to collect into a solid edition the best of the longer and shorter squibs, satires, jeux d'esprit, and epigrams which have been written by Oxford residents during the last two centuries. On the spot, and with the help of libraries, diaries, and unwritten tradition, much could be found out about the collateral circumstances of the various compositions which the lapse of time will inevitably obliterate. Our attention has been lately drawn to an amusing exchange of shots between a member of Magdalen College and a member of Jesus College in 1709. It may be presumed from the subject of the duel that it had an interest beyond aumed from the subject of the dust that it had an interest beyond the University precincts, but it is remarkable how little even the indefatigable and curious research of Notes and Cheries can bring to bear upon the quarrel and its origin. Of the first shot, and him who fired it, indeed, much more is known than of the counterblast to it. Edward Holdsworth, born in 1688, was educated at Winchester and Magdalen Colleges, and is surmised

^{4 [}Muscipula, sice Kambpomyomania. Londini: E. Curil. Ozon: J tophem. Muccin. Motpomopospacia. Sice Hoplandia Descriptio. Londini. Muccin.]

to have been a native of Southampton. His refusal, in 1715, to take the cath of allegiance to the Hanoverian succession, and his High-Church sympathies, might seem to indicate a descent from the staunch Master of Emmanuel at Cambridge who suffered so much persecution and imprisonment for the sake of Charles I., and who died in 1649, as it is said, of grief for his master. What is more certain is that Edward Holdsworth was an elegant is more certain is that Edward Holdsworth was an elegant scholar, whose remarks and dissertations on Virgil were edited by Spence for Dodsley in 1768, and are still well worth reading both for their scholarship and their artistic taste and knowledge. His poem, on which we are about to touch, ran through at least two editions, was held worthy of enshrinement amidst the "Musse Anglicanse," and has been thrice translated. The best translation is in blank verse by Dr. John Hoadley, a son of the Bishop, and a writer of some ability, and is to be found in the fifth volume of Dodsley's "Poems by Various Hands"; the second-best is a rather free and paraphrastic version in heroics by Samuel Cobb, M.A., of Trinity, Cambridge, published by Cutll in 1720; and the worst, an anonymous version in "very blank verse," printed in London for R. Gosling in 1715, and professedly "done from the original in Milton's stile." None of the three at all come up to the spirit and neatness of the original, which is prefaced in the second edition R. Goaling in 1715, and professedly "done from the original in Milton's stile." Nome of the three at all come up to the spirit and neatness of the original, which is prefaced in the second edition by an epistle dedicatory to "Robert Lloyd, a fellow-commoner of Magdalen College," couched in terms of genuine compliment to a student apparently of good family and promise, and at the same time expressing some mock-heroic scruples lest, by choosing from the Cambrian annals a somewhat low and ridiculous theme more adapted to his "jocose lyre" than those grander arguments to which no heroic language but the Welsh can do justice, he should have detracted from the dignity of an historic and susceptible nation. And yet no Welshman, he implies, need take offence at the Muscipula, the aim of which is to vindicate for a pre-historic Cambro-Briton a discovery which Greece—having stolen Astronomy from the Chaldees, Letters from Phænicia, and Jove himself from Crete—would fain claim for her comparatively modern Homer, a bard who flourished no more than three thousand years ago.

What was the source of the galf in which Holdsworth dipped his pen it is in vain to discover in the absence of any light from contemporary gossip or anecdote. Possibly his Winchester and Magdalen friend from the Principality was of higher rank than the many Joneses of Jesus, and a satire on his ruder comparints

Magdalen friend from the Principality was of higher rank than the many Joneses of Jesus, and a satire on his ruder compatible may have served as a subtle compliment to one who felt that he could not be confounded with vulgar Taffies. By the latter, at all events, the "Mouse-trap" was regarded as a national affront, which, as it was offered by a Latinist of high repute for poetical skill and scholarlike acquirements, must be answered by their ablest champion. But before we deal with the answer we must give an idea of the challenge. The poem opens with an appeal to the Muses and to Phosbus, in his synonym of Smintheus—

Nam to quoque quondam Muribus infestum dixorunt Sminthes vates

to leave Parnassus for one of the Cambrian heights, and thence to look down with favour on a mean argument woven into humble verse. A picture is drawn of the universal depredation committed almost with absolute impunity by the mouse-plague, and it is urged that what afflicts the whole world generally touches the Welsh part of it with particular keenness:—

Quia cassus illis Multus olet, quem mus non seque ac plurima libat, Aut leviter tantum arrodit, sed dente frequenti Excavat interiusque domos exsculpit edules.

Though the "heroic" translator Cobbe is usually too diffuse, he gives a neat turn to the last of the above lines, describing the cheese as being for the mouse "at once his lodging and his meat." The poet next describes the wrath of the Cambro-Britons, with a sly hit at their national irascibility, and a broader allusion to a disorder for which he insinuates more than once that sulphur continent was in great request. Dr. Hoadley translates with creditable closeness the lines which end with

Cum digitia credas animos quoque sulfure tinctos:--

Nature prone to wrath The Cambrians formed, and bade their flory breasts Burst into sudden rage—that men would deem Their souls were with their fingers sulphur-ting'd.

In order to show that there is a just cause for this wrath against the mouse, the poet next depicts the clever shifts by which it eludes the cet, and in a happy mock heroic flight likens its clinging to its fastnesses to the ancient Britons in their re-sistance to Cosar:—

Sio Cambri (Cambros liceat componere muri)
Elusere hostes, cum Julius, orbe subacte,
Imperio adjecit Britonas; sio nempe recessit
Ad latebras gena tota, et inexpugnabile vallum,
Montre: sic sua saxa inter, medioque ruluse
Delituit tuta, et desperans vincere, vinci
Nobult; hine priscos memorant longo ordine Patres
Indomitasque crepant terras, linguague senectam.

An indignation meeting and a council is summoned to St. David's, which was, it seems, as forlorn in 1709 as in 1872 :-

Supremo in limits terms
Concilium accitur, qua nunc Menevia pleret
Curtates mitra titulue et nomen inans
Semisepulta urbia,
Am elder, with a beard the envy of native billy-goats, leaning his
back against a well-worn post, opens the proceedings. In spluttur-

ing accents he invokes the patriotism and investion of a countrymen. His oratory has its effect. As Hondley translatures

Searce a heal But with imaginary mount

The honours of the competition are reserved for "Tally," the eponym hero of his race, "faber idem, idemque sension," whis justifying stratagem by a speech ending with Virgil's "Dolus an virtus quis in hoste requirat," narrates a dream wherein the capture of a too cheese-loving and adventurous mouse in his own lovo; of or own anggesta the idea of a mouse-trap on the model of that "mordax vinclum." It is strange, he moralizes:—

Quan cacio pasibus errat

Quan cacio pasibus errat

Camarum series! nobis mus ipse estatem

Invitus dedit, et ques attuits ante dolora,

Tollere jam docuit; neve hume hebuisse magistr

Vos pudest patres: fus est vel ab hoste doceri.

The Welshmen go home delighted. Coming events cast shedows before them in propitious omens. For example, to vary the Latin by Hoadley's English:—

The mousing kind (Prophetic instinct) show unwonted j.y. (inmesome, and (if we credit Fame) beneat The matron's hand dances the embryo ches

Next comes the description of the trap, which is too long to quote. In baiting it, a hit at the Cambro-Britons and at Welsh rabbits is opportunely introduced :-

Quo fragrantior easet Cascus, et mureur invitaret longius, escam Fatalem torret fiammis vunque addit odori,

And the trapping of a leading mouse on the first night of its being nut is also intensely mack-heroic :-

Explorat barid, jamque introltumque sagaci Explorat barid, jamque irremeabile linea Ingressus, votíque potens, tristem arripit escam, Exitiumque vorat lætus, potiturque ruinā.

On the morrow's dawn an ass is despatched as a herald, and an On the morrow's dawn an ase is despatched as a herald, and an owl as ambassader, to bid the Principality to a view of the success of Taffy's device. "Parturiant montes," writes the poet, and anon he describes how l'embroke, Merioneth, Bangor, Casmarthen, the Wye side, Montgomery, and Glamorgan pour forth their deputies to witness the sport which is to be the issue of the capture. The familiar routine of Pussy's watching the trap, and whetting her appetite, when the mouse is at length in her grip, by playing with her victim, as

With sportive cruelty, a subtle task, She acts the tyrant in a lover's mask,

is nourtraved in the Latin; and the final execution amidst the shouts of the mountaineers has suggested a capital touch about echo amidst the hills :-

Lætis clamoribus Echo implent. Æthern: clamoresque licho, Cambras incola terra, Læta refert; resonant Plinimmonis ardua moles, Et Brechin, et Snowdon: vicina ad sidera tertur Plausus, et ingenti strepit Othe Fossa tumultu.

It is needless to add that the poem ends with a glorification of Taffy, who thenceforth has his day in the Welshman's Calendar, and his leek to match with Apollo's laurel.

As Holdsworth was by his school, if not by his birth, connected

As Holdsworth was by his school, if not by his birth, connected with Hampshire, it occurred as a matter of course to the writer of the retort, which the wounded self-esteem of the Principality took care should be fired off without delay, to turn the tables upon him by ridiculing his nursing-mother and her stye. Accordingly the anonymous Hoghardie Descriptio, which in a mock dedication purports to be addressed by "Maredydius Cadugams Plinlimmonensis" "augusto admodum et undequaque spectabili herois Domino H————," turus, as might be supposed, on the adagial designation of "Hampshire Hogs." Holdsworth seems to have been of the High-Church party of his day, and a friend and fellow-student of Sacheverel; and on these points he is attacked by his assailant with a savareness which is intended probably to make up student of Sucheverer; and on these points he is attacked by his-assailant with a savageness which is intended probably to make up-for some inferiority of satire. In the prose dedication there is a hit-at some crotchet or paradox in regard to parallel lines in mathe-matics. The writer pretends to see such a likeness in the exploits of Taffy and of Bevis of Hampton, that all the world will take both poems to issue from the same brain, "Linese volut sibi invicam poems to saue from the same brain, "Linear volut sibi invicam parallelir, que te judice (quicquid inepti garriunt mathematici) ab eodem centro ducuntur"; and, joking apart, there is less maritim the lucubration of the Welsh champion, because it is throughout an example of the tu quoque style. It descends, too, to scurrility when, in reference, as it would seem, to Holdsworth's personal appearance, the dedication suggests that he should himself superintend the engraving of a hog as the frontispiece, either from the life or the looking-glass, "perinde erit utriusque proboscidi indatur

The opening of the poem refers to Apolle's occupation as a rineherd, but the taste for such personalities as—

Tuque, Holdsworthe, donsi vetule sen rancida rodia Ossa suis; tumidi carmen servile megistri Seu justu componis, ales-

an aliusion, it seems, to Dr. Sacheverel—is a symptom of was ness. The writer, after this exordium, goes on to show how #h was once Arthur's warlike realm, all save the lucky life. Wight, was now given over to hogs and hog-finders. To wild hoar overspread the land and rected up and decemed ti crops. As in the Muscipula the Welsh rise against the means to here the Belgm (As. the dwellers in Witts, Hants, and Romense d the

he a stand against the hog, when the odour and the mischief this past become intoinrable. A council is commoned to athempton (Trisentonis cetia), and as the summoner fails to ag the lieges together by the sound of the trumpet, the happy aght comme to him to beat a testo on a long's-tub: of the past b

Ictu pulsata frequenti Insonat et stupidam longè vocat amphora turbam : Quadrupedes bipedasque eadem ad convivia porcas Della cama cient, grazque ultro accurrit utenque.

The master of the altuation in this case is the famous Bevis, of whose it is told that

Ille quid angina vel quid porrigine captes Sanaret porces novit: que cura nocentes Pellet hyescami vires; meliuane farină Pinguescant au giande? auum demum omnia norat.

He does not, like Taffy, go upon the authority of a dream; but, having done a little in mole-catching, has got a wrinkle which he thinks may be brought to bear on swine. Thus we are introduced to the grand counter-effect of the poem. The description of hog-Associated to which Bevis resorts to trap the hogs into letting themselves be ringed—to wit, getting himself up as a mounted hogin-armour, and scattering, as he rides, soporific pills of beer, and wine, and poppy-seed:-

Torvas aper visum insequitur: fugit ille sequentem Budanti tremebundus equo; pilulasque crumenă Expediena, superosque vocana, per compita passim Dispergit, magicăque feram consopit ofeliă.

The monster is thus overcome by subtlety, and the picture of the crowd that is brought together by its grunting when it awakes to its ringed snout and impaired powers of mischief—a crowd which its ringed shout and impaired powers of mischiel—a crowd which includes the Winchester weaver and the Stonham poet, who is none other than Holdsworth—is plainly meant to match the "echo of the mountains" and the "torrent from the hills" in the "Mousetrap." Of course the concourse ends in a feast; and of course on such an occasion the Soyer or Gouffé of Southampton in that day tinvents a new viand. Sausages and pigs-puddings date from this exploit of Bevis of Hampton, which was so fruitful in good results and undamaged pasture and tillage that a grateful posterity looked upon one who had done so much as a deliverer whose exploits and labours rivalled those of Hercules :-

Hine vastasse urbes, immenså hine mole leones Dicitur, atque urses, et predigiosa gigantum Corpora Bevis humi stravisse et mille chimeras.

So ends Hoglandia Descriptio, and our apology for not letting the only English version we have seen of it take turns with the Latin is that it is of no great merit, and is apt to put the personal criginal. Of its author nothing is known, though in Notes and Queries we find his name given as "Mr. Richards of Josus College" (3rd Ser. vol. iii. p. 239). But, after all, the very little we know of Holdsworth is through his Muscipula and his notes on Vivella. Virgil.

THE GILDED AGE.*

A MERICA has as yet had so little time in which to establish a standard literature that the appearance of a sustained effort in the shape of novel or romance from the pen of a well-known American writer seems an agreeable event to the English reader, whose eye is wearied merely by running over the voluminous announcements of works forthcoming in the market of his own country. It is probable that there are many more novels published in with some degree of success than are ever heard of on this side of the Atlantic, where only those names which can claim a place in the first rank are likely to spread their fame. When Hawthorne, Wendell Holmes, Mrs. Beecher Stowe, and Sylvester Judd, the author of a beautiful and too little known romance entitled Margaret, have been mentioned, the list of writers of a reputa-tion already established through works of fiction extending to any langth (Edgar Poe is the author of only one such work) is well nigh exhausted. Amongst writers whose names are beginning to be well known here by the same means are Miss Louisa Alcott and Miss Elizabeth Phelps. The fact that other well-known athors confine themselves as a rule to brief flights in the region of romance may be traced either to the rapidity with which life is carried on in America, or to the comparatively short period during which civilized life has been carried on there at all, or to a comhination of both these circumstances acting and reacting upon each other. Foremost among such authors as these are Bret Harte and Mark Twain; to which names perhaps that of Josquin Miller, the producer of that brilliant fiction Life Among the Modors, should be added. Bret Harte is best known by a series of sketches Western life, of remarkable force and skill in execution so far of Western life, of remarkable force and skill in execution so far as they go, but they have never gone beyond a certain limit. They have been excellent in graphic description of scenery, in a facility for indicating with a few bright touches all the surroundings, entirate and inanimate, of a certain phase of life seen under various aspells. Their author has successful admirably in drawing with a hold hand and free touch outlines of character in a manner that has made it easy for the imagination to fill in the complete picture; and perhaps one charm about these performances is to be found in this very inct, that they leave an opportunity for the reader to use

The Glidel Age. A Kovel. By Mark Twain and Charles Dullig mar. 3 vols. Louism : Boatledge & Sons. 1874.

his own powers of invention in supplying something to what dignet believ him, and exercising his faculty of soft-esteen in admissing the skill with which he acquire himself of the task? The nearest approaches made by Bret Harto to a matchined effort of faction have been Mrs. Single's Heatends and An Spicole of Philippion, which was considered of sufficient importance to merit the honour of a translation in the Revue des Dans Mondes. In both of these were to be seen favourable examples of the writer's power of gramping types of character and giving them life in vigorous Englisher American; and also some amount of real pathetic purception, which was apt at times to degenerate into mandlin continuous. In both also, and especially in the Encode of Philiferense, there was a want of cohesion and artistic purpose, an absence of the faculty of construction, which left an impression of a straggling kind on the reader. There is nuch difference, but there is some likeness, between Brot Harte and Mark Twain. Both have made their name so far by brief sketches and narratiges; the forte of the former lies in the subtlet form of humour, in a power of postical perception, and an intermixture of pathos underlying incidents which may on the surface be the reverse of pathetic. The strongth of the latter is rather in a keen gense of the ludicrous, and in occasional bursts of elequent description or invective. In both is to be found, in one form or another, the method of humour which has become peculiarly was considered of sufficient importance to merit the honour of a translation in the Resected Deux Mondes. In both of those were to description or invective. In both is to be found, in one form or another, the method of humour which has become peculiarly American. One would perhaps expect Bret Harte of the two to write the better novel, because his insight into the feelings of humanity seems closer and finer; it is not surprising therefore to find that, where livet Harte has failed in the faculty of concentration and finish, there also, in a longer narrative than that writer has yet given to the world, Mark Twain and the author who has worked with him, Mr. Warner, should fail.

The Cilded Age is a novel which purports to give a representa-tion of life and manners in America in certain classes; which pre-sumably also purports to have some kind of coherent plot—of what kind it is not easy to see. It opens with a description of a small town in East Tennessee, a town lazy, dirty, and inanimate, which one Squire Hawkins, postmaster and storekeeper, is just determining to leave for the wider and livelier fields of Missouri. Before he starts with his family and belongings, he confides to his wife that he has taken up seventy-five thousand acres of land in Temessee, and in this he sees a princely fortune, not for him and her, but for their children and grandehildren after them. Meanwhile Missouri seems likely to afford them an opportunity for while kinsouri seems likely to anora them an opportunity for enterprise, and thence an old friend Eschell Sellers, a speculative genius, has written to Squire Hawkins a churacteristic letter, announcing that he has "got the buggest scheme on earth," and is prepared to take Hawkins into it. Of Eschol Sellers and his schemes Mrs. Hawkins, musing by herself, gives a good de-

scriution : -

The man did honestly believe there was a fortune in that black gunnay oil that stews out of the bank St says is coal; and he refined it himself thit it was like water, nearly, and it did burn, there's no two ways about that; and I reckon he'd have been all right in Cincinnati with his large that he and I reckon he'd have been all right in Cincinnati with his lamp that he get made, that time he get a house full of rich speculators to see him exhibit, only in the middle of his speech it let go and shoot blew the basis off the whole crowd. I haven't got over grieving for the money that cost, yet. I am sorry enough Eschol Sellers is in Missourt, new, but I was glad when he went. I wonder what his letter says. But of course it's cheerful; the's never down-hearted—never had any trouble in his life—didn't know it if he had. It's always surrice with that man, and thus and blazing, at that—never gets moon, though—leaves off and rises again. Notody can help liking the creature, he means so well—but I do dread to come scross him again; he is bound to set as all cross of surrices. again; he is bound to set us all crazy, of cour

again; he is bound to set us all crazy, of course.

Attracted by the brilliant visions of Sellers, the Hawkins family start for Missouri, picking up an orphan child and adopting him by the way. Before they arrive at their destination they fall in with an incident essentially American in the shape of a desperate race between two river stessners, on one of which they are travelling. The enterprising captain of this boat piles turpentine, bacon, every kind of combustible into his furnace, until the engineer, with native exaggreration, assures him that "every time a nigger leaves a stick of wood into the furnace he goes out the chimney with it"; but in spite of these praiseworthy efforts his rival gains steadily upon him, until they both jolt and lock together in the middle of the river. Then follows a harmless interchange of shots between the two captains, and then occurs an explosion, accompanied by various herrible incidents, after a careful description of which the authors tell us that "these things must not be dwelt upon." They also think it necessary to add a footnote at the end of the chapter in these words:—"The incidents of the explosion are not invented. They happened just as they are told. -The Authors." would seem to point to a moral purpose—a desire to mark the evils of steamboat races—in the introduction of the explosion, and with this no one can quarrel. But Mark Twain, who has on other occasions shown that he possesses a great power of forcible description—for instance, in the account elsewhere of a volcame eruption in the handwich Islands—has in this issuence failed signally in his attempt to be impressive. The effect produced upon the nally in his attempt to be impressive. The offset produced upon the seader's mind by the history of the explosion is simply one of diagust. However it serves one purpose, that of saddling the Hawkins family with another orphan to adopt—a girl this time, by name Laura, presently called Laura Hawkins, her real same seing uncertain. And thus they arrive at a village in Missouri, where they are received with open arms by Colonel Sellers.

Having got them there, the authors open a new chapter with this statement, the latter part of which seems a little unnecessary:—
We skip ten years, and this history findle certain clumpes to record."
In this auddes shifting of scenes the reader gets a tent of the ram-

bling character which the book assumes from this point. The Hawbling character which the book assumes from this point. The Hawkinses have made and lost fortunes, and so have the Sellerses; but with a faith the genius for speculation and invention possessed by the Colonel, Washington Hawkins goes off when his family are at a bad pass to see what Eschol Sellers can do for him at Hawkeye, a town in the interior of Missouri. The ingenious Colonel succeeds in finding him a clerk's place, where he promptly falls in love with his chief's daughter. There is a good description of the dreamy young man's feelings when, having been summoned home by his father's illness, he has said good-by to the object of his love: to the object of his love :-

to the object of his love:—

All the way home he nursed his woe and exalted it. He pictured himself as she must be picturing him: a noble, struggling young spirit persecuted by misfortune, but bravely and patiently waiting in the shadow of a dread calamity and preparing to meet the blow as became one who was all too used to hard fortune and the pitiless buffetings of fate. These thoughts made him weep, and weep more broken-heartedly than ever; and he wished that she could see his sufferings sow.

Washington Hawkins is one of the best drawn characters in the book; of the men, certainly the best drawn. About the other young men, chief among whom are two named Philip Sterling and Harry Brierly, there is a want of individuality and consistence; the actions of the one might be transferred to the other without giving any serious offence to the reader. Colonel Sellers, again, with his poverty-stricken home and his quick tongue ever ready to convert bareness into profusion, descends too often into the region of farce to fulfil the promise which he gives on his first appearance.

appearance.
From the time of Washington Hawkins's translation to Hawkeye the Gilded Age, as has been said, becomes an simless, disjointed piece of work. There are several plots none of which are particularly interesting, all going on at once and having but the faintest connexion with each other. There is a young woman named Ruth, who takes to studying medicine and ends by marrying the house character is not ill conceived on avecated, but as much who takes to studying medicine and ends by marrying Philip Sterling, whose character is not ill conceived or executed; but so much of one's attention is wasted over the long and minute accounts of the various speculative operations into which every one is continually plunging, that it is difficult to follow the fortunes of the various characters. Pages and pages are taken up with the business workings of these speculations, which are always carried on with an amount of forruption from the lowest to the very highest places which we can only hope is somewhat overstated. If it is not, then the worst and most degraded Governments that history can tell of are equalled by the Congress of Washington. No doubt Mr. Mark Twain and Mr. Warner ought to know better on such a subject than their English readers; still one cannot help wishing to believe, for the sake of America, that they have "set down aught in malice." The principal plot, if any of them can be called principal, is contained in a set of incidents in the life of Laura Hawkins, who, while still young, falls desperately in love with a Southern Colonel, who, in a set of incidents in the life of Laura Hawkins, who, while still young, falls desperately in love with a Southern Colonel, who, as she thinks, marries her, but really calls in the aid of that poor worn-out old trick a mock marriage, having indeed another wife alive on his hands. This being so, he naturally leaves Laura after a time, with an outward as well as an inward brutality which is out of keeping with the idea conveyed of his character. She has a long illness, from which she recovers with the heart of a fiend, as we are several times informed. But she does nothing more fiendish than firting desperately with all the young men whom she meets, until after some years all the converse her Colonel again. To him she clings with remarkable partingity, and, when he leaves her a second time, pursues him and pertinacity, and, when he leaves her a second time, pursues him and shoots him to death. She is tried for his murder, and the trial scene is interesting as showing the great difference between an English and an American criminal court. To see the counsel for English and an American criminal court. To see the counsel for the defence in a great murder case rise and address the jury with a most moving speech, habited in a brown frock-coat with a rose in his button-hole, would be to those accustomed to the solemnity of English courts a considerable surprise. Thanks, however, to the ability and elequence of this gentleman in the brown frock-coat and the rose, Laura is acquitted. She then takes to lecturing, is treated with scorn by her audience, and dies of a broken heart. The reader is avidently avnoted to avnotable with her articular The reader is evidently expected to sympathize with her entirely, but she is too unreal a person to excite much sympathy, even if from the circumstances she deserved it. The book concludes with the marriage of Philip Sterling and Ruth, who is one of the few the marriage of Philip Sterling and Ruth, who is one of the few people whom it is possible to feel an interest in. The others are disposed of in various summary ways. Clay Hawkins, we are told, the orphan picked up at the very beginning of the book, had wandered westward upon trading ventures. "His life lies beyond the theatre of this tale." Then what possible end was served by introducing him into it? Washington Hawkins's last action is to get rad of the Tennessee land from which his father hoped so much, and which he says has been a curse to them all. Thus the rurrocae get rid of the Tennessee land from which his father hoped so much, and which he says has been a curse to them all. Thus the purpose of the story would seem to be "Put not your trust in Tennessee land." But in truth it has no definite purpose or construction; it is a set of scenes of American life, which may be truthful or may not, which are sometimes amusing and interesting, and sometimes much the reverse. On the whole, admirers of Mark Twain who wish to retain their admiration unalloyed had isster leave the Childel Are alone. Gilded Age alone.

MR. GLADSTONE'S RESIGNATION. controversy whether a Minister defeated at the elections ought to resign before the meeting of Parlisment has already lost its interest; but it is well that constitutional changes, as they become from time to time expedient, should be deliberately adopted and generally understood. There is no doubt that the precedent established by Mr. DISRAELI, and now followed by Mr. GLADTONR, conduces to public convenience. The embarrassment produced by the temporary continuance in office of a Government about to expire has often been experienced in the United States. By a deviation from the purpose of the framers of the Constitution, the election of a President virtually takes place four months before his appointment by the titular electors who from the first became more delegates of the constituency. During that period once in avery four years; except when the President has, like General Grant; been re-elected, official power and patronage are divorced from political authority. In some instances, as at the close of Mr. Andrew Johnson's term, the President has ceased to enjoy the confidence of any party, while he still retains his large constitutional prerogative. The same anomaly would be produced on a smaller scale if an English Prime Minister awaited, after the unfavourable result of a general election, an adverse vote in Parliament. The moral influence which supports the legal authority of Government would in the meantime have departed; it would be impessible to frame measures which the Ministers would not afterwards have the opportunity of proposing; and every disposal of place or dignity would be regarded with jealousy, as a vexatious encroachment on the rights of the succeeding Government. On the other hand, it has been forcibly contended that a resignation immediately after an election involves a transfer to the nation at large of the powers of Parliament. It is true that the governing an Assembly rather than of the collective constituencies the indispensable condition of freedom and good government; and the most objectionable part of Mr. Gladstown's unfortunate address to the electors of Greenwich consisted in his attempt to pass a Budget by a popular vote. The promiseuous votes which are regarded by French Imperialists as the only legitimate foundation of power have hitherto only served to sanction despotism and power-have hitherto only served to sanction despotism and usurpation; but the creditable scruples of English constitutional critics may be answered by the suggestion that, in resigning his office, Mr. Gladstone has merely discounted or anticipated the decision of Parliament. The members of the majority had already in their speeches and addresses announced their intention of opposing Mr. Gladstone's Clausement and it was courtains and reasonable announced their intention of opposing Mr. GLADSTONE'S Government, and it was courteons and reasonable to suppose that they would not capriciously contradict their professions. It was not from any depreciation of personal provess that the celestial champion in Paradies, Lost suggested to his adversary a prudent acquisscence in an inevitable result. Mr. DISRABLI knows Mr. GLADSTONE'S force, and Mr. GLADSTONE knows Mr.

Mr. GLADSTONE'S force, and Mr. GLADSTONE knows Mr. Directles, and there would be no use in fighting for a prime which is already awanded. Accordingly the Princis Ministree fied, and with him fied the shades of much perinanent of temporary unpopularity.

If it were intended to take a division on the election of a Speaker, a carrious complication might be produced by the immediate resignation of the outgoing Government. Make the Prime Ministree nor any of his principal collection will have scate in the new Farliament when it makes; and yet the first business of the House of Communic is to organize itself by the choice of a Speaker

who, among other functions, must issue writs for the who, among other functions, must issue writs for the elections to the places which have been vacated. It might therefore happen that, in an important contest, the majority would be deprived of fourteen or fifteen votes and of the advice and influence of all the leaders of the party. No such contingency arose in 1834, because Sir Robert Pert had formed his Administration before the dissolution. Since that time the Speaker has always been chosen or re-elected without a contest. If Mr. GLADSTONE had, in deference to the reported opinion of one member of the Cabinet, determined to await a hostile vote, either the re-election of the Speaker would have been challenged, or the actual Minister must have framed the Speech from the Throne, and have left it to the Opposition to move an amendment to the Address, which would certainly have been carried. Since it would be irregular and indecorous for the Queen to deliver a second Speech, the official catalogue of Ministerial measures would become obsolete and impracticable as soon as it had been framed. It is obviously desirable that Mr. DINBARLI should be formally as well as really responsible for the intended legislation of the year; and during the short time which will be allowed for the preparation of his measures, the members of the new Cabinet ought to have unrestricted access to the records of their several departments. permanent functionaries of the various offices will serve the new Ministers as loyally as they aided their prede-cessors, but an expectant Secretary of State or Chancellor of the Exchequer could not have held official intercourse with an Under or Assistant Secretary with an Under or Assistant-Secretary. It happened that after the Goneral Election of 1841, when an overwhelming majority of Opposition members was returned, the Parliamentary Session was almost at an end. The dissolution took place in June, and it was at the end of August or the beginning of September that Lord Mriscusar's Government was defeated on a vote of want of confidence. The prorogation followed almost immediately on the appoint-

ment of the new Ministry.

Mr. Diseaseli's majority is only half that of Sir Robert
Perl, nor can it be said that he commands the personal confidence which was reposed in the former Conservative leader; yet the immediate prospects of the Liberal party are perhaps there hopeless than after the fall of Lord MELBOURNE. Lord JOHN RUSSELL was in 1842 the acknow-MELBOURNE. Lord John Russell was in 1842 the acknow-ledged leader of a united minority, for his claims were uniformly recognized by O'Connell, who represented the Irish malcontents. Mr. Gladstone excels Lord John Russell in Parliamentary eloquence and in official experi-ence, and he will for the present probably not be em-barkassed by any mutiny among his adherents; but it is not certain that he is auxious to resume office, or that he certain that he is anxious to resume office, or that he will think it worth while to commence the slow process of forming again the Liberal majority which has been dissipated by unskilful or unlucky minagement. It would be highly injudicious to begin his career as leader of Opposition by violent attacks which the whole country would resent as a protest against its recent decision. Custom and fairness prescribe the practice of giving spew Government a fair trial, unless indeed there is a chance, as in 1835, that it may be at one defiven from office. Mr. Government a fair trial, unless indeed there is a chance, as in 1835, that it may be at onee driven from office. Mr. GLADSTONE's temper and qualities are not well suited to a waiting game, and it is doubtful whether the hope of becoming again Prime Minister four or five years bonce would be to him either attractive or admissible. If he were tempted into an immediate display of pugnacity, he would not be followed by the moderate Liberals who in diminished numbers still form a recognized portion of his party. Any leaning to the Irish Home Rule party would be recently he marry the whole body of Scotch and.

English Liberals; and there is no other outlying section with which he could coalesce, as he coalesced with Mr. Disraell in two successful assaults on Lord Palmers-TON'S first Administration. No one suspects Mr. GLADstone, though he may be sometimes excited by political passion, of a sordid or selfish eagerness for office. It was well known that his strange delusion about Mr. Diseaeli's refusal to form a Ministry after the defeat of the Government last year was chiefly attributable to his own personal desire for repose. It is not so agreeable to be driven from office as to resign voluntarily at the head of a majority; but in his address to the electors of Greenwich Mr. GLADSTONE declared, with evident sincerity, that he should be not unwilling to retire from office. The Liberal party cannot rely upon their leader to prepare through years of toil and patience their restoration to power.

If Mr. Gladstons now, or at a future time, retires from

the chief conduct of Opposition, it will be difficult to find a successor to his post. Mr. Cardwell, who would have been the most available candidate, is about to ascend into a calmer atmosphere. Mr. Lowe, though he is, after Mr. GLADSTONE and Mr. BRIGHT, who would not be a possible chief of Opposition, the most brilliant of the outgoing Ministers, is deficient in the popular qualities which are required in a party leader; nor can the more zealous Liberals be blamed for regarding with imperfect sympathy the former adversary of every measure for the extension of the suffrage. Mr. Lowe himself is not unlikely to place additional embarrassment in the way of any competitor who may be preferred by the party. Possessing, through the considerate care of Mr. DISRABLI, a seat where he is in no danger of being capriciously disturbed, Mr. Lows will probably devote himself to candid and pungent criticisms on the conduct and measures of the Ministry; nor will he he restrained by the caution of any Opposition leader who may nominally represent the party. Mr. FORSTER is popular in the House, but he is disqualified for the post of leader by the violent animosity which he has unfortunately provoked among the Nonconformist and Secularist section. The selection of Lord Habtington, though it would surprise the country in general, would perhaps be more acceptable than any other to the House of Commons. He possesses two qualities, negative or positive, which would at the present moment be valued above other gifts. He is reputed to be cautious, and he is known not to be eloquent. It is not impossible that the succession may ultimately devolve upon Mr. Goschen or on Sir W. Harcourt, but neither has yet attained the Parliamentary position which could entitle him to represent the Liberal party. It must also be remembered that the Liberals are not united among themselves on any definite policy. Some wish to disestablish the Church, or to tamper with property in land, or to extend and redistribute the electoral franchise; but it may be doubted whether a third of the House of Commons could be induced to vote for any fresh political change immediately after the country has expressed an unmistak-able desire to leave things for the present alone. Few stranger events have occurred in recent times than the utter collapse of a party which had for a whole generation, and down to the eve of the last election, been regarded by itself and by its opponents as irresistible and supreme.

THE NEW MINISTRY.

WHEN in the spring of last year Mr. GLADSTONE resigned, and it was supposed possible that the Conservatives might take office, it was rumoured that Lord DERST, and not Mr. DISRAELI, would be Prime Minister. Like most rumours, this rumour was not based on any facts, but was merely a solution that seemed prohable to those who speculated on the difficulties which Mr. DISRABLI might have to encounter. These difficulties were mainly two. It was conjectured that Lord Salisbury and Lord Carnaryon would decline to serve under Mr. Disrabli; and their loss would be so serious a blow to the party that some device would, it was imagined, be found to make their tenure of office possible, and the only device that suggested itself was that it should not be Mr. Diseall under whom they were asked to serve. The second difficulty was that of finding a tolerably capable Chancellor of the Exchequer, if Mr. DISEARLI was not to hold the post. Mr. DISEARLI as a financier can scarcely be called a capable Chancellor of the Exchequer; but what is wanted in a Consequentian Chancellor is not so but what is wanted in a Conservative Chancellor is not so

much the power of devising financial measures as the power of defending them when they are submitted to the criticism of Mr. Gladstone. Neither of these difficulties has on the present occasion been suffered to stand in the way of Mr. Deseall's Premiership. Lord Salesbury and Lord Carnaryon have consented to take office under him, and have it is believed. have, it is believed, returned to their old places as heads of the Indian and Colonial Departments. If to either of them the step has been in any way painful, and some feelings of justly offended pride have had to be stifled, it is obvious that they have only made a sacrifice which they were called to make in their own real interests and in those of their party and the country. The temptation which presses on mon who have everything that station and wealth can give to isolate themselves, and stand aloof from practical politics, when they have had to undergo personal mortifications, is one which English noblemen are especially called on to resist. The House of Commons presents continually less and less attraction and opening to men of independent character and of such claims as mere knowledge and fitness for political life can give.

If Peers who are of a similar type consulted merely their personal feelings, and passed their lives in dignitheir personal feelings, and passed their lives in digni-fied inactivity, the guidance of public affairs might possibly pass before long into the hands of a class of men who are fitter to be prominent in a new country than in an old one. There are, too, advantages in holding office which no one who wishes to exercise a salutary influence over public affairs can afford to neglect. Lord Salisbury and Lord Carnaryon have shown great capacity as administra-tors, but it is only by administering that advance can be made in the difficult art of administration. India and the Colonies could not be in better hands than those in which they will now be placed; but those who will now preside over their destinies cannot full to gain largely in experience, judgment, and knowledge, by having to leave the attitude of external criticism, and to decide on great questions by the light of those broad principles which cast into the shade the somewhat petty though exciting issues of home politics.

The second difficulty has been met, if not surmounted, by the appointment of Sir Stafford Northcote as Chan-cellor of the Exchequer. Probably no better appointcellor of the Exchequer. Probably no better appointment could have been made. Sir Stafford NORTHCOTS is the pupil of Mr. GLADSTONE, and may be trusted not to depart widely or consciously from the main lines of the financial policy of his master. He is not likely to be brilliant as a Chancellor of the Exchequer, but he will be sound and safe, is sure to get up his facts and figures well, and if he cannot always reply to the objections of Mr. GLADSTONE, may cousolo himself with the thought that even the arguments of Mr. GLADSTONE are awarless against a majority of fifty. The real difficulty he new Chancellor of the Exchequer will not, however, be so much the production of mild unobjectionable Budgets, or the refutation of Mr. GLADSTONE by reasoning or votes, as the control of the spending propensities of his colleagues. The Conservatives come in as the champions of numbers of people who think themselves deprived of that amount of Government money which they consider they are entitled in the nature of things to look for. to the Conservatives that clamorous officers and discharged workmen and underpaid postmen have fied for refuge, and the Conservatives have welcomed the suppliants with open arms. To please all these discontented people will coat a great deal of money, and to disappoint them will be to reveal the terrible secret that one party can do no more for them than another. Some, too, of Sir STAFFORD NORTHCOTE'S colleagues have personally strong inducements to get as much money spent on their departments as they can. They have associated their names with the cause of those who have asserted that the late Government was niggardly and meanly unjust. It will be almost impossible for the Duke of Richmond to explain to the officers who are dissatisfied with the terms offered when purchase was abolished that they are not to gain anything by the stern and partithey are not to gain anything by the stern and passimonious Cardwell being driven out of office. To deal with the question of Local Taxation, again, in the manner in which the bulk of the supporters of the Ministry would like to see it dealt with, would be a very uncomfortable task for a Chancellor of the Exchequer. Up to a certain point, no doubt, a Conservative Chancellor may properly apand more money than a Liberal one. It is quite the proposition that in a great and wealthy country moreony is of more importance than the saving of this period. It is foolish not to make the service of the country attractive enough to secure good servants, and that to sell stores one year and buy them back the next is not economy at all. The theory on which the late Ministry proceeded was a totally different one. Their maxim was that the great duty of a Ministry is to take off taxes, and that the only efficacious means of taking off taxes is to hunt up every penny of the national expenditure that can possibly be steeped. Sir Stafford Northcore is not called on to rival his predecessors in economy. To give a fair price for a good article, not to spend as little as possible, is the Conservative theory. But then this way of looking at finance, though theoretically defensible, is apt practically to lead a Chancellor of the Exchequer into painful diffigulties, and firmness of resistance must be the chief quality he has to show.

Fortunately for Sir STAFFORD NORTHOOTE, one of the leading members of the Cahinet may be trusted to be on the side of thrift. Lord Debby is constautly preaching the gospel of economy, and may be trusted to practise for the benefit of the nation what he preaches. The Foreign Minister can spend nothing on his own department, and the only way in which he can burden the nation is by plunging it into war. No man could be less likely to go to war if he could help it than Lord DERSY. It will be convenient and proper for the Conservatives to proclaim themselves the supporters of a spirited foreign policy, and there can be no serious objection to it provided it never leads to unnecessary war, to blustering interference, or to offending allies. It is not likely that any occasion will present itself to Lord Deep to embarrassing as the Alabama quarrel; and if it does, he will have gained experience at the expense of Lord GRANVILLE, and will know that arbitrations in which England gives up everything beforehand are not the sort of arbitrations that England thinks fair. Under ordinary circumstances, Lord DERBY may be trusted to be quite as pacific as Lord DERBY may be dead Mr. DISRAELI will be perfectly aware that the one thing that would turn the constituencies speedily wound thing that would turn the constituencies speedily round would be the alarm caused by finding that we were always sailing as near war as we dared to go. For some of those mysterious reasons which seem to compel a Prime Minister to put members of his Cabinet in the wrong holes, Mr. HARDY is, it is said, to be taken away from the Home Office and sent to the Admiralty. That Mr. HARDY will do well enough in his new post may be probable, for Mr. Goschen has shown that a First Lord may do very well though be terts without knowing anything of his business. Mr. Hardy was a first-rate Home Secretary, and Lord ABERDANS has conclusively proved how important it is for a Minister to put a thoroughly efficient official at the hard of the Home Department. Mr. Hunt may be trusted to be pleasant and obliging, and to do his work fairly well, but the new Home SECRETARY has some awkward que tions before him. Beer has done great things for the Conservatives, and beer will expect to have its reward; and the judgment, firmness, and tact of the Hour Shorstary will be severely taxed if he is at once to keep the publicans in good humour, and yet to teach them that the world was not made exclusively for their benefit. Had the position of Mr. Hand and Mr. Hunt been reversed, the chief appointments made by Mr. Diseable would have been beyond criticism; and it will be a matter of universal satisfaction that his health permits Lord Carres to act once more as Chancellor. As to the minor appointments, Mr. Diseable cannot avoid disappointing many aspirants whom he might naturally wish to estisfy; but there is no feer lest the public should not be well served. The Conservative party is rich in mambers who may be extions before him. Beer has done great things for the mo feer lest the public should not be well served. The Conservative party is rich in members who may be expected to succeed beyond the average of excellence in the discharge of the daties of subordinate offices. That some of those many members should now have an opportunity of showing what they can do, and of profiting by the lessess of practical experience, is one of the many good results of the change of Ministry.

THE NEW BARLIAMENT.

House of Commons is now a Commons is now complete, and consideratives and got Liberale. Mr. Disnas And yet Conservatives and yet Liberals. Mr. Disnants

There are comewhat dry details, but a general sense of

the distribution a majority of yet, which is quite as large a

There are comewhat dry details, but a general sense of

the complication to which they lead is sure to have a very

majority as any Minister can want. A few deaks ago Mr.

Grandman had a nominal amjority of 66, and now place, be a Parliament with a new Government, whose

he is out of office with a majority of 50 against him The character of the Conservative gain is also no less remarkable than its extent. In the last Parliament there were, at the close of the general election, 493 English members, of whom 268 were Liberals and 225 Conservatives. As Bridgwater and Beverley have been since dis-framohised, there are returned to this Parliament 489 English members, of whom 296 are Conservatives and 193 are Liberals. The English constituencies have thus returned in round number seventy more Conservatives than in 1868, the boroughs returning fifty and the counties twenty more. The total number of Conservatives in the present House of Commons who represent English constituencies exceeds the total number of Liberals representing English constituencies by 103. In other words, there are three Conservatives returned by English constituencies to two Liberals. When, therefore, it is said that Mr. DISBARLI starts with a majority, it may be added—and for the purposes of many political calculations it is most important to add that his majority, if England only is looked to, is doubly as large. In Scotland there are now 4x Liberals to 19 Conservatives. Scotland is therefore even more decidedly Liberal than England is Conservative; but the Liberalism of the Scotch constituencies now is nothing like what it was in 1868, when not a single Scotch borough returned a Conservative, and only seven Conservatives were returned by Scotch counties. Taking Great Britain as a whole, the Conservatives have 315 members as against 234 Liberals, or a Conservative majority of 81. If we turn to Ireland, we find 67 Liberals, deduction being made for the double return at Athlone, and 36 Conservatives. Of the total of 103, there are probably about 53 who have, in order to secure their elections, had to speak favourably of Home Rule, and about 30 who have been returned distinctly in the character of Home Rulers. With two exceptions, the 53 members who, under pressure or voluntarily, have connected themselves with the Home Rule movement, are all reckened as Liberals. Thus, out of the 301 Liberals, 51, or one-sixth, are, on any question connected with Home Rule, pledged to obey the dictates of the leaders of the movement. Under a strong Conservative Government it dees not make much difference whether there are or are not 51 Liberals who have obtained their seats under such circumstances. But there can be no doubt that the strength of the Conservatives in the new Parliament is beyond their permanent strength in the country. As Mr. DISRAELI truly and modestly observed, the constituencies have been guided by a wish not so much to put him in as to put Mr. GLADSTONE out. How large a reduction ought to be made in order to bring the two parties to their normal strength in Parliament it is difficult to say. But we may gain some valuable light on the point by referring euce more to the elections of 1868. The Conservatives then held 131 seats for English counties; they now hold 154, and the greater part of this gain has been of a permanent kind, as was shown by the constant gains of Conservatives in the by-slections for English counties during the continuance of the last Parliament; but the counties were I and an area beautiful. but the counties near London may have been specially affected at the recent elections by the deep dislike enter-tained for Mr. Gladstons's Ministry. To allow for this we may perhaps take off ten, and put their permanent strength in the English counties at 144. In 1868 the English boroughs returned 216 Liberals and 94 Conservatives. They now return 160 Liberals and 142 Conservatives. Mr. GLADSTONE some little time ago owned that 1868 did not fairly represent the permanent political opinions of the English boroughs, and that the Liberal gain was acci-dentally large. Now the Conservative gain is, no dealst, accidentally large. Perhaps it may not be very far wrong to divide the present Conservative gain, and to take wrong to divide the present conservative gain, and to take 118 as the permanent strength of the Conservatives in the English boroughs, giving them in all 262 English members. If 15 are added for Scotland and 35 for Ireland, there is a total of 312, which the present elections may be taken to show is the very lowest estimate that can be safely taken of the safely t the real Conservative strength. This leaves the Liberals 350 snambers, and as 50 of them would be pledged more or less to Home Bule, this permanent strength of the Liberals apart from Home Rulers is 300 as against 312 Conservatives.

faults and shortcomings have yet to be revealed, which will be under the guidance of a Ministry securely seated, and supported by a compact and trustworthy majority. It will be itself ready to give more than a fair trial to the Government; it will obey its wishes and vote that it is always right whatever it may do; and it will know that the country wishes the Government to have a fair trial, that the great majority of moderate men of all parties are very glad that a Conservative Ministry has been formed, and glad that a Conservative Ministry has been formed, and that the Conservatives must make some very had blunders indeed in order to throw the blunders of the late Liberal Government into the shade. In the next place, the Liberals will be in a very peculiar position. It will be not nearly as much gain to them as it usually is to an Opposition to win seats at by-elections. Let us suppose that it is true that the Conservatives now hold 296 English seats, whereas their permanent strength would only give them 262; and this is a computation designedly made as unfavourable to the Conservatives as seems in any way consistent with probability. The Liberals must win 17 scats at by-elections to put themselves where they would be according to the standard of their permanent strength, and to win 17 scats at by-elections takes a long time and very hard work. But then, when they had attained this result, they would only be in the position of having 300 on their side as against 312 Conservatives. They might get fifty more votes by forming an alliance with the Home Rulers; but if they did this, they would at the next general election infallibly lose all they had gripped at hypoleutions and if they did not they received had gained at by-elections, and if they did not, they would be aspiring to hold office with a virtual minority. The Louth election must have dissipated the last lingering hopes of ardent Liberals that Irish constituencies would feel gratitude for eminent services, and would respect a long and honest adherence to the general principles of the Liberal party. The Irish constituencies care for nothing whatever but gratifying their own private wishes. It all comes round to this, that the members belonging to the Liberal party now go to Westminster without anything to encourage them and stir them to exertion, with no hopes of a victory by which they can profit, and with no chance of their leaders taking office except by forfeiting their own self-respect and the support of the bulk of the party Lastly, in Scotch and English constituencies. only have the leaders of the Liberal party almost nothing to work for except to do all they can to improve the measures of the Government, but they will assume the guidance of the Opposition under most dispiriting circumstances. Their ranks have been most terribly thinned. Mr. CARDWELL and Mr. CHICHESTER FORTSECUE will be no longer there, and many of the minor members of the late Government have lost their seats. The list, too, of the independent Liberals so odious to Liberal Ministers, so useful to Liberal loaders in Opposition, has been cut ruthlessly down. Mr. Gladstone is indeed left, and a party that is led by Mr. Gladstone can record he invitational that is led by Mr. GLADSTONE can never be insignificant. But Mr. GLADSTONE is in a position to depress beyond measure any ordinary man. He has thrown away a majority; he has rained his faithful supporters by the rash stop he took for their benefit, as he supposed, in suddenly dissolving Parliament; he has risked everything for Ireland, only to find himself treated with an ingratitude that is scarcely credible; and he, so lately the idol, as he was assured by flattering journals, of the English people, is now driven out of power because the English people ask for any other Ministry than his.

The House of Lords will meet under circumstances that have long been strange to it. The majority in the Upper House will be in harmony with the majority in the Lower, and it is thirty years since this was the case. The days of being abused, threatened, intimidated, of having their decisions overruled by summary exercises of the Prerogative, of hearing a Prime Minister say that he will think three times before he does away with them, are gone by for the Peers. They will now have to help friends, not to guard against enemies. A very large proportion, too, of the higher offices of State must necessarily be held by Peers under the new Ministry, and the Lords will feel not only that affairs are being guided as they would wish, but that they have ready and constant access to those who are really guiding them. There will, however, be an Opposition strong in ability and eminence rather perhaps than in numbers, which cannot fail to exercise a great and wholesome influence. Lord Derby will feel that he has his equal in Lord GRANVILLE, and the CHARGELLOR will be sensible of the

advantage of working in harmony with Lord Selecter. To this Liberal Opposition in the Lords Mr. Gladetone has made some well-chosen additions. Mr. Cardwell and Mr. Chichester Fortescue have served their party and their country long and well; have done many things well, and some few things very well; have held and expressed distinct-opinions without violence and rashness; have lived through difficult times, and discharged difficult duties without giving offence. If a peerage is a welcome refuge or an acceptable honour to either of them, they are fairly entitled to it. Why Mr. Cardwell, who kept his seat for or an acceptable honour to either of them, they are marry entitled to it. Why Mr. Cardwell, who kept his seat for Oxford, has put himself on a level with his rejected culleagues and left the House of Commons, is a question which naturally suggests itself. But he may see that the prospect of his sitting in the House of Commons as a Minister is somewhat remote, and, if he is to be in Opponition he may naturally think that the dignity and easy sition, he may naturally think that the dignity and easy hours in the House of Lords would suit him; and if a Duke is to be the new Secretary for War, he would like to defend personally in the House to which the new Secretary belongs the measure which he has worked so hard to carry out, and to see, if possible, that his labours are not made worthless and his plans spoiled. That Lord Engield should go to the Upper House in his father's lifetime is natural enough, as the result of the Middlesex election must have made him disinclined to wait altogether out of the political world in the vague hope of some day regaining his seat. The pecrages given to Sir Thomas Fremantle and Mr. Hammond are scarcely connected with party politics. They are the rewards of long services, and may be accepted as a tribute to those merits of the Permanent Civil Service which the late Ministry has been Permanent Civil Service which the late Ministry has been accused of being inclined to overlook. They are both men of special experience and knowledge, and have been conversant with important details of administration for the best part of a long life. If they use their knowledge and experience for the benefit of the body which they are now about to join, their assistance will be welcomed and recognized by one party as much as by the other recognized by one party as much as by the other.

THE EMPERORS AT ST. PETERSBURG.

THE most resolute students of the history of Court festivities must be satiated for the time with the reports by conscientious newspaper Correspondents of the pageants of St. Petersburg and Moscow; yet before the wedding party have set forth on their travels, another illustrious guest has arrived to share the Imperial hospitalities. It is difficult to bear in mind the combinations and permutations of Royal and Imperial visits. In the course of last year the Emperor of Russia, the King of Italy, and the German Emperor were gorgeously entertained at Vienna, and the same potentates held separate interviews with one another same potentates held separate interviews with one another at Berlin. The Emperor of Austria is now paying a return visit at St. Petersburg, and it is believed that important business will be transacted during his stay. Within two or three years great efforts have been made to terminate the long-standing estrangement between the Russian and Austro-Hungarian Governments; and the Emperor of Austria perhaps wishes formally to announce the re-establishment of friendly relations. The antagonism between the two Empires is not of modern date, nor is it exclusively due to special provocations. Alexander and Metternich charished special provocations. ALEXANDER and METTERNICH cherished towards each other a political and personal antipathy which frequently exceeded the bounds of diplomatic courtesy. During the negotiations of Vienna and long afterwards, the influence of Austria constituted a powerful impediment to Russian projects of aggrandizement; and whenever the ancient design of the dismemberment of Turkey is hereafter revived, Austrian and Hungarian statesmen will no doubt again be active in counteracting the policy of their formid-able neighbour. For a few years the Emperor NICEGLAS had reason to believe that his services to the Emperor FAARGIS JOSEPH had allayed the ancient jealousy of Austria. In 1849 a Russian army suppressed the Hungarian insurrection, and in the following year the King of Prussia, on the eve of a rupture, tamely succumbed to Austria, at the imperious demand of the Emperor of Russia. It was believed that even at that time Prince SCHWARZ-ERBERG, then Prime Minister of Austria, profished his intention of rewarding the Russian services by a display of gigantic ingratitude. The story was perhaps suggested by the subsequent realisation of the meason during the Crimena was. In his attack upon

Turkey the Emperor NiceoLas had counted on the friend-ship and connivance of Austria not less confidently than on the pacific tendencies of Lord Aberdeen and Mr. GLADstorm; and the occupation of the Danubian Principalities by Anstria, which secured Turkey against a renewed Hussian invasion, produced a deeper feeling of resentment than the direct hostility of France and England.

It happens that Russia and Austria have unusual facilities for inflicting on one another reciprocal annoyance; and for seventeen or eighteen years after the Posce of 1856 both Governments habitually employed to the utmost their large opportunities of mutual vexation. The modern study of ethnology has done much for potentates who desire to cultivate quarrels with their neighbours; and the mixed races of Eastern Europe contain the materials of innumerable national squabbles. Half the subjects of the Austro-Hungarian monarchy speak various Slavonic dialects; and in some provinces the Orthodox Greek Church lects; and in some provinces the Orthodox Greek Church divides spiritual supremacy with the Roman Catholic hierarchy. It consequently occurred to ingenious Russian politicians that science and national sympathy required the institution of Slavonic societies at Moscow, where members who happened to be Austrian subjects were welcomed with significant cordiality. Discoutented Czechs and Serviens were encouraged to count the autronome of and Servians were encouraged to court the patronage of the Emperor of Russia, who was supposed to be the national chief of the entire Slavonic race. If the Austrian Government was compelled to tolerate foreign encouragement of disaffection, there was some consolation in the display of extraordinary regard for the Galician Poles. During the last insurrection in Russian Poland, while the Prussian Government sternly repressed in Posen all sympathy with Poland, the feeling of the Galicians was strongly excited against Russia, not without the sanction of the Government of Vienna. Unfortunately for Austria, the peasantry of Galicia is not of Polish, but of Ruthenian origin, and both by blood and by religion it inclines rather to Russia than to Austria. The intrigues on both sides, though they caused much inconvenience and ill-feeling, have happily not resulted in war; and since the sudden and violent disturbance of the balance of power by the events of 1870, it seems to have occurred to the two Imperial Governments that it might be as well to bring their chronic quarrel for the time to a close. All monarchies have a common enemy in democratic revolution; and the reasons which formerly combined uncongenial confederates in the Holy Alliance have not ceased to be operative. For some time past the Panslavonic enthusiasts in Russia have discontinued their patriotic agitation.

It is supposed that among the subjects of discussion between Prince Gortonakorr and Count Andrassy will be the condition of the Roumanian Principality. It is difficult to understand the interest of Austria in relaxing still further the feudal ties which connect Roumania with the Porte. Russia, on the other hand, has long desired the establishment on the Lower Danube of a nominally independent Power which might perhaps at some future time offer facilities for encroachment on Turkey. The titular sovereign of the Principality would probably be disposed as a cadet of the House of Hohenzollern to court the patronage of Germany rather than of Russia or of Austria; but Bucharest is far from Berlin, and the two adjacent Empires necessarily exercise great influence in Wallachia and Moldavia. For some unexplained reason the relations of Austria and Hungary with Turkey have lately become less friendly than in former times; while Russian diplomacy has won a remarkable triumph in obtaining the confidence of the SULTAN. It will therefore not be surprising if the interview of the EMPEROES and their Ministers at St. Petersburg is followed by some proposal for the modification of the relations between Turkey and the nominally dependent provinces. The Prince of Servia, as an avowed client of the Emperor Alexander, will probably share any additional privileges which may be conceded to the Roumanian Government. If Turkey and Command Covernment. ment. If Russia, Austria, and Germany concur in any new arrangement, and especially if they obtain the assent of the Porte, it will be difficult for England to interfere, and France has for the present withdrawn from active participation in Eastern affairs. Lord Paluesson himself was unable to privent the union of the Danubian Principalities which was promoted by Napolson III. with the active Parliamentary support of Mr. Gladstons. In the present day political influence, like gravitation, bears an inverse ratio to distances. There is probably no foundation for a

statement which has appeared in the Allgemeine Seiling, that the German Government is disposed to concur with Russia in the diamemberment of Turkey. Such an enterprise, even if it could be reconciled with German interests, would involve a desperate straggle with Austria; and yet it is certain that the three Imperial Governments are at present disposed to maintain with one another friendly

The general politics of the Continent will not furnish the Russian and Austrian Empress with practical aphients of negotiation. Both potentates would deprecate the renewal of a struggle between France and Germany; and if a rupture unfortunately occurred, both would, as before, remain neutral. The irritable and menacing attitude of the German Government towards France is not easily to be explained. It is now asserted that the alleged Circular to the German Envoys is not a Circular, but a document of a less formal or more confidential character; but it seems to be admitted that remonstrances or warnings have been more or less directly addressed to France. Neither Russia nor Austria has any sympathy with the Ultramontane agitation which is sometimes encouraged by successive French (Lovernments, nor, on the other hand, are they pledged to approve of Prince BISMARCK'S domestic legislation. If it were necessary to take a side, Russin, and probably Austria, would incline rather to Germany than to a Power which is nominally a Republic. It is satisfactory to observe that French politicians for once abstain from indulgence in illusions as to the aid of foreign allies in possible future contests. As a judicious Fronch writer remarks, France will have all Enrope for allies as long as peace is maintained, or, in other words, as long as no allies are wanted; but during the present reign Russia will maintain close friendship with Germany; and Austria has finally acquiesced in the consequences of the decisive struggle of 1866. If it is true that the Emperor ALEXANDER designs to visit England during the present year, the cycle of Imperial progresses will be completely rounded. In this country the annalists of State ceremonies will be able to pursue their vocation undisturbed by any suspicion of diplomatic mysteries arranged by Lord DERBY in the secret precincts of Downing Street.

THE IRISH ELECTIONS.

SOME of Mr. GLADSTONE'S zealous supporters candidly acknowledge that the result of the Irish elections partially reconciles them to their recent defeat. It is doubtedly better that a body of forty or lifty members pledged to the dismemberment of the Empire should be encountered by a compact majority, than that they should be able, as in the days of O'Connell, to decide successive struggles between nearly equal parties. The incoming Ministers will from circumstances, if not on principle, he less inclined than their predecessors to offer partial concessions to the Separatists. Mr. Diskaria bestowed in former times much trouble and ingenuity on the unprofitable task of conciliating the support of the Irish Roman Catholics. Having been baffled by the rash impetuosity of the late Lord Draw, and having been afterwards outbidden by his great political rival, he has taken several occasions of announcing his determination not to renew negotiations which indeed would probably be impracticable. On the other hand. Mr. Gladstone, after doing much for the removal of Irish grievances, has repeatedly asserted his confident belief that his great measures would succeed in their object of allaying disaffection. In the address which announced the dissolution he tendered a trifling instalment of the demands of the Home Rule faction in the form of some projected machinery for the discussion of Irish Privata Bills in Dublin. About the same time he proclaimed his inability to understand the meaning of Home Rule, with the obvious purpose of leading the Irish to suppose that some interpretation of the popular doctrine might perhaps be accepted. Even if his Government had remained in office, the elections for Tipperary, for Louth, and for other constituencies would have forced on Mr. Glaustone himself the conviction that compromise was impossible, though he might sell have heritated to affirm a demonstrable he might still have hesitated to affirm a demonstrable proposition in plain and intelligible language. A Liberal majority consisting partly of advocates of separation would have been paralysed from the opening of the new Parliament. The number of successful Home Bule candidates corresponds nearly to the calculations which had previously

been made both by the friends of the movement and by its opponents; but untoward events which have actually occurred are more impressive than vague anticipations.

The Roman Catholic clergy are perhaps even more keenly disappointed than loyal subjects of the Crown. Although they may temporarily conceal their defeat by joining the popular agitation, they cannot but feel that the coincidence of the Home Rule movement with the establishment of the Ballot has destroyed the power which they had often misused. In the Louth contest the Roman Catholic clergy, in their anxiety to disguise their failure from themselves and from their flocks, adopted the unusual course of refusing to obey their Bishop, who had declared himself in favour of Mr. CHICHESTER FORTESCUE. Because the Home Rule candidate was certain to succeed, they were suddenly impressed with the duty of exacting adhesion to the Home Rule resolutions passed at the late meeting in Dublin. It was less possible for the priests to identify themselves with the winning cause in Limerick. During the preparatory contest which preceded the general election the Bishop and the clergy had earnestly supported the Home Rule candidate in opposition to the representative of Fenian opinions. The violence which had often been encouraged by clerical agitators was now directed against the priests; and Mr. O'SULLIVAN was returned at the head of the poll. In Tipperary the anti-English faction almost succeeded in nominally returning Mr. John Mitchell, whose sentence for treason committed in 1848 is still in force. In common with several other leading patriots, Mr. Mitchell directly afterwards escaped from custody at the trifling cost of a deliberate breach of parole. Having joined the Democratic party in America, he at one time acquired popularity by a speech in which he expressed his wish to become the owner of "a lot of fat "niggers," and when abolition came into fashion he necessarily adopted the Southern cause. His Tipperary supporters are eager to proclaim their indifference to personal character and to political opinion, in comparison with the paramount merit of rebellion; nor are they sorry for the occasion of reminding the priests that the days of querulous and veiled sedition are at an end. Cardinal Cullen, who always coupled the Fonians with the harmless Freemasons in his denunciatory Pastorals, is now fully aware that Irish agitators are not bent on securing Denominational teaching as their principal object.

It is possible that the Louth election may have conveyed to Mr. GLADSTONE'S understanding some inkling of the significance of Home Rule. Mr. Chichester Fortescus is the highest in character and position of living Irish statesmen; he was one of Mr. GLADSTONE'S most confidential colleagues; and it was well known that, after the PRIME MINISTEE himself, he was the chief author of the Church Act and the Land Act. Although Mr. FORTESOUE had ceased to be Irish Secretary, he had probably been consulted on the illusory project of passing Private Bills in Dublin; and if he failed to share Mr. GLADSTONE'S deliberate obtuseness as to the meaning of Home Rule, he openly professed his readiness to concede to the Roman Catholic hierarchy a large share in the control of education. No man was more personally popular in Ireland or in England; and his renewed candidature was a test whether any concession to be offered by a Liberal Government would be accepted by the Separatists as a compromise. The answer consisted in a hostile majority of nearly two to one. It is not the fault of Home Rule electors or members if they are still from habit classed in newspaper lists as belonging to the Liberal party. Their votes will no doubt be customarily given against the measures of Mr. DISRAELI and his colleagues, but they will scarcely have the opportunity of inflicting on the new Government a blow as heavy as the rejection of Mr. CHICHESTER FORTESCUE. Even the strange declaration of Lord O'HAGAN in favour of a further confiscation of proprietary rights for the benefit of the occupiers of land has not reconciled the malcontents to the Liberal Government and its policy. The farmers hope under a native Government to accomplish projects of application which no English Ministry could propose to an Imperial Parliament.

The organized disaffection of a large part of the Irish population furnishes no legitimate ground for party triumph or recrimination. Although Mr. Gladstonn's measures gave the signal for the present agitation, the Home Rule movement was inevitable, and it would perhaps have been yet more formidable if the anomaly of the Reinblishment had still existed, and if small tenants had not been secured against eviction. It is still more curtain that Mr. Gladstonn's University Bill, even if it had been accepted by the Roman was inevitable, and it would perhaps have been yet more concy.

formidable if the anomaly of the Reichblishment had still M. Rouwer may be appuilted of any limit desire to bee existed, and if small tenants had not been accured against down in the house of Runner. While professing to de eviction. It is still more certain that Mr. Glassform's reverses to the September, he is mally doing all he are unity Bill, even if it had been accepted by the Roman to appear to the Reptember, he is mally doing all he are the probably marked kinned.

Catholic hierarchy and adopted by Parliament, would unither have obviated nor postponed the clamour for exparation. Although half-a-dozen English members, including Mr. Cowen of Newcastle, have at the distation of Irish electors pledged themselves to the doctrine of Home Rule, the whole of Great Britain is unanimous in the determination to maintain the integrity of the Empire.
The O'Sullivans and the Mitchells supply a conclusive answer to the transparent affectation of a desire for Federal institutions which might be compatible with the unity of the Kingdom. A score of gentlemen, some of them officers in the army, who have condescended to profess adhesion to the doctrine of Home Rule, would gladly welcome any positive assurance that the domands in which they ostensibly concur will be peremptorily rejected. As to the re-mainder, the Home Rulers are merely put forward by the Fenians for the purpose of avoiding a direct conflict with the law. The distinction between lukewarm Home Rulers and Separatists is so well understood that the Irish members who have taken the Ropeal pledge have determined not to attempt any separate organization of their forces. the next election some other cry may possibly take the place of Home Rule. Mr. Burr can assuredly not hope to attain his professed object by the consent of Parliament, and the prospects of more advanced advocates of independence were never less hopeful than at present. Irish rebels have ceased to subscribe for swords of honour to be presented to Marshal MacManon; and the American adventurers who were thrown out of employment by the close of the Civil War no longer hope to indulge their propensities in Ireland. If the Home Rule members have the good sense to take part in the general business of Parliament, two or three periodical motions for separation will cause little inconvenience. A secossion from the House of Commons would be rather annoying than dangerous, especially as but a small minority of Irish members would be inclined to tamper with schemes of rebellion. The present Parliament at least will not tolerate the proposal of a subordinate Legislature, which would probably devote itself exclusively to the matters which might by a Federal compact be expressly excluded from its cognizance. Not a single Irish press is prepared to take his sest in an Irish a single Irish peer is prepared to take his seat in an Irish House of Lords, nor are the Protestants of Ireland preared to acquiesce in the establishment of a Catholic Republic.

THE IMPERIALISTS AND THE SEPTENNATE.

ROUHER has proved himself an expert in the art · of conveying a civil insult. His letter to a provincial journal which has been fined for speaking wrongly of the present form of government in France must have made the MINISTER of the INTERIOR regret that he had not left the offender alone. It is less easy to proceed against M. ROUHER than to prosecute an obscure newspaper; yet M. ROUHER's letter has done more to reanimate the Imperialists than a whole year's articles in the Clermont Amide l'Ordre, and the alarm of the Government is plainly manifested in the measures directed against the proposed demonstration on the PRINCE IMPERIAL'S birthday. For the future, M. ROUMER says to the editor, be more respectful to the Septemnate. Had I seen the article which has got you into trouble, I should have counselled you not to publish it. The Septemate is but a poor thing, I grant, but, so far as it goes, it helps the imperialist cause. It only professes to be a makeshift, and unforescen events may at any moment bring it to an and. But it reserves to a future day the definitive expression of the national will, and that is exactly what the Imporialists most desire. They want time to reorganise their forces, and the present truce between parties gives them this. When the Septennate comes to an end there will be but two forms of government between which the French people will have to choose. On one side will be the Republic, on the other side the Empire; and with this after-Republic, on the other side the Empire; and with this after-native before them the great majority of the electors will have no hesitation in giving the preference to the Empire. In the meantime the duty of every Imperialist organ is to support the rudimentary and transient institutions which for the present are all that France possesses, and to preach the indissoluble alliance of the interests of order and demo-

this letter, that the Government was not strong enough to reach its publication. The fact is, as has been often pointed out, that though the Imperialists are not numerically strong in the country, they are strong in the possession of nificial experience, while in the Assembly the balance of parties may make their votes indispensable to the Government in any close division. The Duke of Brown has to appoint new mayors all over the country, and he cannot but feel that a mayor who knows nothing of his work may make the law and the Government which passed it ridiculous instead of formidable. He knows, too, that the Extreme Right is not to be trusted, and that among the Right Centre there are some whose sympathics point towards union with the Left Centre. With these facts to deal with, he cannot set towards the Imperialists as he would probably like to act towards them if he had the power. He is obliged to put the best face he can on their insolence, and accordingly be instructs the newspapers who befriend him to treat M. ROUBER'S letter as an expression of confidence in the Septennate. How far Marshal MacMahon likes being plainly told that he is only a rather superior sort of warming-pan for the PRINCE IMPERIAL does not appear. Porhaps the Marshal only reads professional newspapers. But that the Duke of BROGLES is trying his hardest to like it is plain. Certainly M. Rouhen knows how to make prosed support a great deal more bitter than avowed enmity. Prince Narouson has been writing in the newspapers as well as M. Rounes, but his ingenuity has suggested nothing more damaging than a direct slap in the face. I can be no partisan, he says, of any Government which is not directly instituted by the people. Before the Septemate could have secured the support of those who remain faithful to the Napoleonic tradition, it must have been established by universal suffrage—the one sovereign to whom all Frenchmen can properly submit. This sort of attack does the Government no harm. It is rather a credit to it with many Republicans that it should be the object of it. But to have to sit silent under M. ROUHER's sneers, to be reduced even to put up with them as a less evil than M. ROUHER's active opposition, is a real humiliation.

The sense of this, joined to the alarm which M. ROUHER's confident predictions have naturally excited, has made both the Legitimist and the Orleanist members of the majority a little uneasy. M. DE FRANCLIEU, speaking for the Extreme Right, assures M. ROUHER that when the appointed time shall come, it will find neither Republic appointed time shall come, it will find neither Republic nor Empire, but that ancient principle of national life which is always equally powerful and comes invariably to save France when all other saviours fail—the legitimate Monarchy. If M. Rouhes is to proclaim Napoleon IV., and M. De Franclieu Hanst V., whenever it occurs to them to write to a newspaper, those of the Orleanists who regard the Count of Chambond's letter as finally disposing of his claim to the Chambond's letter as finally dispesing of his claim to the Throne will naturally wish to have their say as well, and the old rumours of a plan for appointing the Duke of AUNALE Lieutenant-General of the kingdom are consequently beginning to revive. These are the ways of supporting Marshal MacManon's authority which find favour with different sections of his supporters. The Government cannot well censure one of them without censuring all, and to censure all would be to make the maintenance of the majority impossible except by conciliating the support of the Left Centre. But the support of the Left Centre is not to be had except upon condition that the Republic is recognized and consolidated, and this is a concession which the Duke of BROGLIE cannot bring himself to make. He will be compelled, therefore, in all probability, to go on in his present course and allow the Septemnate to be insulted at every turn by its professed Septements to be insulted at every turn by its professed friends. This is not a policy likely to increase the respect in which it is held in the country. The majority of the electors less no opportunity of aboving that they wish for a Republic, but in most cases the Republic they desire is so Conservative in character that there might not be much difficulty in persuading them that Masshal MacManon's difficulty in presuading them that Marshal MacManon's rule presents all the necessary qualifications. But in order to impress them in this way the Government must show a firm front to its enemies. A Republic which does not claim to be parameter, which allows its adversaries to content about the succession in its lifetime, which submits to be presided because it is content to smooth the way for its latters, is not a Republic which gives any

the same this plainty, and he has very

a Government plays his game better them anythin else could play it. If the September commands respect, or at least showed itself resolute in requires respect, the nation might come by degrees to somephit as the established form of government, and all that would be necessary at the end of the seven years would be to make such personal changes as the retirement of Marshal MacManon might require. But if the Septennate is continually asseiled without making any attempt to defend itself, the nation will come to regard it as giving that security for public order which they are determined to demand of the Government. It is probable that when the country has once made up its mind that Moushal MacManon's Government is not capable of development into a Conservative Republic, it will simply draw the conclusion that the Conservative Republic mast be organized by other hands. But it is possible that it may draw the conclusion that a Conservative Republic is an impossibility, and in that case there can be little doubt that the Empire would secure a preponderance of votes. In spite of all the associations connected with Sedan, the Empire is less unpopular than a Legitimist Restoration. Its name does not conjure up ideas of old abuses; on the contrary, down to 1870 it was chiefly identified with material presperity. PRINCE IMPERIAL will be eighteen next month, and long before the Septennate has come to its natural end he will be old enough to assume the Government without so much as a suggestion of any regency. He is in no way responsible for his father's errors, and his youth and inexperience will for his father's errors, and his youth and inexperience will-naturally help to win him friends. The Bonapartists when have been invited to do him homage at Chislehurst will return home with glowing accounts of his urbanity and talents for command; and in proportion as Frenchmen cease to see in Marshal MacManos a protector against Legiti-macy, with its train of attendant abuses, they will lease to see one in the Prince Imperial. This probably is M. ROURER's calculation; and though there are many things which may come in to falsify it, there is a sufficient possibility of its proving accurate to make the Duke of Bacquare seriously uncomfortable. It has apparently been found impossible to answer M. Rounes directly; but the Circular of the MINISTER of the INTESION with regard to the Chislehuret gathering clearly betrays the disquietude of the Government.

EDUCATIONAL ASPECT OF THE ELECTIONS.

THE General Election which has so often been appealed to as the touchstone of the educational controversies of the last four years has left no doubt what are the negative conclusions at which the electors have arrived. They may not be very clear as to the subjects they want taught, but they have made it unmistakably evident that they do not want religion not to be taught. They may have uncertain views as to the precise relations between voluntary and School Board schools, but they have left no excuse for supposing that they wish School Board schools to have the whole field to themselves. There is no reason to suppose that the Dissenters showed the late Government any forbearance, or that they waived any chance of returning a Secular candidate in order to give a helping hand to a Cabinet in diffi-culties. Next to the rejection of the Prime Minister at Greenwich, no more damaging blow could have been dealt to the Government than the rejection of Mr. Forerse at Bradford; but this reflection did not prevent the advanced Nonconformists from working their hardest to deprive him of his seat. The conspicuous success of the Minister who is the special object of Nonconformist hatred, and the defeat of the party as a whole in a great measure because it was supposed, not only by its foes, but by a large number of its friends, to be contemplating some concossion to this sentiment, supply between them an unswer to the League's challenge. When Mr. Dixon reviews his to the League's challenge. When Mr. Dixon reviews his troops at the beginning of the Session he will find that doughty little band worfully lessened in numbers. It will be but a shadow of his former following that he will have to lead to fresh assents upon the 25th Clause, and inspirit by fresh declarations that Britons will never learn the radiments of secular knowledge from lips which at some other hour of the day may be polluted by Denominational formularies. If Mr. Foreran has placed himself on a pinnacle of infany which is only shared by Juna Isdantor—this pious but not original parallel is borrowed from a Dissenting minister at Rochdale—the country is so thoroughly corrupted that it has agreed to call his treachery consistency.

Yet in looking tack over the history of the famous cause round which the battle has raged, it is impossible

not to be struck with its unfitness for the prominence that fortune has assigned to it. Mr. DISRAELI lately declared that the question before the country is whether national education shall be founded on the consecrated basis of religion, or whether it shall be entirely secular. "The 25th Clause," he added, in accents of solemn warning, "is the symbol of the controversy, and you must be "for it or against it." In a sense no doubt this is true. There can be no compromise with a man who feels his conscience hurt at the thought that a fraction of his contribution to the education rate may go to pay the cost, not of religious instruction, but of secular instruction in a school in which religious instruction is given at the cost of some-body else. But there is great possible inconvenience about the erection of the 25th Clause into a symbol, or a prin-ciple, or anything of that exalted kind. If the right of the parent to refuse to send his child to any school which does not give religious instruction such as he can approve of as well as secular instruction be once recognized, what will become of compulsion in country districts? In proportion as compulsion becomes the rule In proportion as compulsion becomes the rule with School Boards, the number of cases in which parents will be forced to send their children to the one available school will increase, and in the majority of these cases this one school will virtually be a Church school. Supposing that a Dissenting parent turns round on a School Board composed entirely of Churchmen, and reminds them that their friends on the hustings and in Parliament have always proclaimed that the parent's conscience is violated if he is forced to send his child to a Secular school, they will be hard put to it to devise a justification for forcing a parent to send his child to a Denominational school. If the Conscience Clause is worth anything, it must be equally a protection to the parent's conscience in both cases. true justification of the 25th Clause is not that it establishes the parent's right to choose his own school, but that it protects him against needless restrictions on his freedom of choice. The Education Department or the School Boards have a perfect right to forbid him to send his child to a school which he likes, or to compel him to send it to a school which he dislikes, provided that the former does not come up to an adequate standard of secular teaching, or that the latter is the only school within reach. But they have no right to interfere with him where the public interest is not concerned, and the State has certainly nothing to gain by preventing him from picking out a school for himself when there are more than one which answer to the prescribed conditions.

The practical importance of the clause being so small, it is not wonderful that Liberal politicians should have asked themselves whether it might not be quietly got out of the way. Those who said Yes to this question forgot, we think, that its accidental importance had by degrees come to be out of all proportion to its real importance. When once the Dissenters had adopted it as the key of the position, the Government were forced to view it in the same light. If Mr. FORSTER had proposed the simple repeal of the 25th Clause, it would have been taken, alike by Secularists and Denominationalists, as an intimation that he was prepared to abandon the principle of the Education Act, and to set himself in avowed untagonism to voluntary schools. The recent elections show what the result of this change of front would have been. If a mere unfounded fear that the Government were disposed to coquet with the Secularists went a long way to give the Conservatives a majority of 50, what majority would conclusive evidence that the Government were prepared to capitulate to the Secularists have given them? That is a sum in political proportion which we should like to see worked out by Mr. ILLINGWORTH. The only way in which the 25th Clause could have been satisfactorily got rid of was by making the payment of school fees a part of the ordinary machinery of poor relief. Mr. FORSTER proposed something like this last year, but he weakened his own position by maintaining an unreal distinction between one form of destitution and an unreal distinction between one form of destitution and another, and refusing to allow money given by the community to enable a man to do his duty by his children to be called parochial relief. Apart from this, the change came too late for the purpose for which it was most immediately needed. The Dissenters had got their backs up, and they were determined to treat 2 dd. raised to pay for a child's schooling as something altogether distinct from 2 dd. raised to pay for a child's milk and water: They were indifferent to the terrible possibility that their money might find its rent to the terrible possibility that their money might find its way to a Denominational dairy, but they were fully alive to the more terrible possibility that their money might find

its way to a Denominational school. If the 25th Clause had been repealed as the Education Act Amendment Bill proposed to repeal it, it is probable that not a single Dissenter would have been appeased, and consequently that not a single moderate Liberal would have been relieved of his fear that the Government would still try to appease them.

In the Government would nave been reneved of his fear that the Government would still try to appears them.

It does not follow from this that, if inability to pay the schoolmaster had in the first instance been put on a level with inability to pay the milk-man, the hostility of the Dissenters to the 25th Clause would have been so mident on that if the tree forms and the standard of the second of the secon would have been so violent, or that, if the two forms of destitution were even now treated as identical, their hostility might not die out. It was impossible in 1870 to foresee that a provision apparently so innocent as that which enabled School Boards to do on a small scale what the Education Department does every day on a large scale, could have contained such latent power of irritation.

The late Government was not to blame, therefore, for omitting to guard against so inconceivable an outburst of impracticable prejudice. But they cannot be so easily excused for not foreseeing the mischief to which the clause might give rise in other wave. to which the clause might give rise in other ways. Except in Manchester, we do not know that the power given to the School Boards to pay or excuse the payment of school fees in the case of indigent parents has been much abused. But that it is open to abuse wherever a School Board is more benevolent than wise is obvious. If a parent too poor to pay for his child's schooling had been turned over to the Guardians, who know his circumstances and can estimate how far his inability is the result of destitution and how far of a natural preference for spending money in other ways, one avenue to dependence would have been closed, and a troublesome controversy would probably have been avoided. Perhaps a Conservative Government can hardly be expected to remove a stumbling block out of their opponents' path; but if they will abolish the distinc-tion between indigence and destitution they will relieve the School Boards of a duty for which they are singularly unfitted, and provide an additional safeguard against a temptation to which, as it is, the poor are often exposed without thought and without necessity.

RAILWAY ACCIDENTS AND SHIPWRECKS.

NE of the first duties of the new President of the Board of Trade will be to consider what course he is prepared to take with regard to the prevention of loss of life on railways and at sea. The two subjects will of course have to be treated separately in actual legislation, but the general principles which should govern legislation are in each case the same. It is obvious that railway Directors stand in precisely the same relation to their passengers as shipowners to their crews, and that, if it is right that the State should interfere for the protection of the one class, it is equally bound to interfere for the protection of the other. Moreover, the kind of interference which is held to be appropriate and beneficial in the one case will probably be found to be no less applicable to the other. The principle that the State is not only entitled but bound to interpose for the protection of life in any business where it appears to be recklessly and wantonly placed in peril, is embedied in a number of Acts of Parliament dealing with different trades and occupations, and may be taken as universally acknowledged. It may also be assumed to be the ground priming that the latest trades and occupations and be assumed to be the ground to be ground to be the ground to be the ground to be gr be assumed to be the general opinion that the loss of life at sea and on railways is excessive, and that a serious attempt should be made to put a stop to this shocking and disgraceful state of things. The only question is in what manner the Government can interfere so as to produce a satisfactory result. Should it interfere at the outset, and direct that no train should be allowed to start or ship to sail except under a Government certificate? Or should it wait until a disaster happens, and then come down on the persons who are accountable for it with heavy on the persons who are accountable for it with heavy penalties? As a rule, prevention is no doubt preferable to punishment, but then everything depends on how far prevention is practicable. For the Government to interfere in a merely formal manner, without doing its work thoroughly, would be simply to do mischief As long as the Government held aloof people would my to take care of themselves. At least they would know that, if they did not, there would be nobody else to do it for them. But when the Government assumes the responsibility of providing for the metery of the public in any way, the public is any apt to neglect presentions which it would otherwise have taken on its own account, and to trust blindly and unreservedly to the Government. Moreover, it is impossible to extend the responsibility of the Government in this manner without at the same time diminishing the responsibility of those whose work it takes in a great measure on its own shoulders. It is obvious, for example, that in the case of a railway the Government could not undertake to guarantee the soundness of plant and permanent way, the sufficiency of the staff in numbers and capacity, or to determine the proper intervals which should be allowed between trains, without practically taking the management of the railway into its own hands; and that when once the Directors had obtained the necessary certificates, they would be free from all further responsibility. The same observation of course applies to ships. If the Government were to say that no ship should sail until it was shown to the satisfaction of its agents that the vessel was safe and sound as regards construction, materials, loading, and in other respects, it would be simply relieving the shipowners of all trouble, or, at least, of all responsibility.

It may be assumed that all reasonable and practical men are agreed that any attempt at interference to this extent would be both absurd and mischievous, and that the best course is to make the persons who have the management of railways or ships feel that, if anything goes wrong, they will be liable to suffer severely, and that it is their own interest to be careful about human life. In addition some preventive checks may be applied, but only in a subordinate way and with great caution and moderation. On this subject the policy of the Board of Trade has hitherto been tentative and experimental. A railway, for instance, is not allowed to be opened for traffic until it has been inspected and certified as safe by a Government official. When an accident occurs an Inspector is sent to report on it, and the Reports accumulate as so much waste paper on the shelves of the department. At the first the Board of Trade has certainly a hold on a Railway Company, but after the railway is once open the Company can do as it likes. The Board has no means of enforcing its recommendations or giving effect to its rebukes by punishment. It is easy to see to what the Government would stand committed if it went much further in the direction of preliminary inspection; but the system of inquiries into accidents is clearly feeble and inconclusive Nothing can be more ridiculous than to see public officials firing off blank-cartridge Reports at the Companies, who, knowing they cannot be hit, merely laugh at the noise. If any value is to be attached to the reports of the Inspectors, they should be invested with some sort of judicial weight. What is wanted is a proper court for investigating railway accidents, which should be able to punish offenders, and to award compensation to the sufferers. A coronor's inquest is not at all adapted for an inquiry of the kind; and of course it can only deal with criminal culpability. If the inquiry were entrusted to a competent and authoritative tribunal, questions of civil damages might perhaps be settled at the same time, and the injured persons would thus be relieved from the necessity of establishing their claims by a series of costly suits. The only effectual way of bringing the Companies under control is to provide those whom they injure in any way with the means of getting at them easily, and making them pay dearly for their neglect or misconduct. It may be inferred, from the answers of the Railway Chairmen to the Circular of the Board of Trade, that nothing is to be hoped for from the voluntary action of the Companies. One Chairman indeed.—Mr. Ethis, of the Midland Company—has had the candour to admit that the dangers of railway travelling are due to the Companies attempting to do more than is in their power; and there is abundant evidence that this is Yet, in the face of this notorious fact, we find the Companies, as a rule, repudiating responsibility, and insisting that their present arrangements, under which accidents are of almost daily occurrence, are as near perfection as anything human can be.

tion as anything human can be.

In regard to ships the same general principles hold good as in regard to railways. The object of legislation should be to make shipowners very careful about the condition of their veluels, by imposing heavy penalties in cases where vessels have been sent out in an unseaworthy state, At present there is an annual survey of all British passenger attenuers, and it is contended that this inspection should be inclined to vessels of every class. The evidence which has been collected by the Royal Coramission shows that the

better sort of shipowners take these precautions on their own behalf, and find that it is their interest to do so; but it may ultimately prove to be necessary to enforce inspections in every case. In the meantime, however, it would be at least prudent to postpone a measure of this kind, which would be costly and troublesome in its operation, until it has been seen what can be done by fastening upon the owner responsibility for the safety of his ships. That a great many vessels are lest every year simply because they are despatched in a rickety or overleaded condition has been proved beyond question. It is admitted by the Royal Commissioners, and it is also admitted by the shipowners themselves. At a recent meeting of the shipowners themselves are there was a discussion as to what measures should be taken with recrust to unas to what measures should be taken with regard to unseaworthy ships, in which it was assumed without dispute that, as the Chairman said, there was " a certain class of "ahipowners who furnished great reasons for Mr. Phinsola's "observations." Mr. RATHIONE pointed out that respectable shipowners suffer in purse by having to pay higher premiums of insurance to compensate for the losses caused by the carelessness or misconduct of others, while they also suffer in honour through the discredit thrown upon their business. The necessity for logislation being admitted, the only question is in what form it should be applied; and Mr. RATHBONE brought forward several plausible arguments against a universal Government survey. It would be scarcely possible to obtain a sufficient number of competent men of high character to undertake the duty; underwriters, shippers, and sailors, would be tempted to trust blindly to an uncertain security; and the owner who sent out a dangerous ship would be able to shelter himself behind the certificates he had obtained. A simpler and more practicable remody is to be found in carrying out the principle of the Act of 1871, that a shipowner should be held personally responsible for the consequences of any neglect or recklessness on his part. Under the Act it is a misdemeanour by fraud or criminal neglect to send an unseaworthy ship to sea; but the wording of the principal section is rather loose, and no machinery is provided for enforcing the law. This deficiency should be supplied; and measures should be taken for securing information as to the depth of hold, the amount of freeboard, and other circumstances, in the case of every vessel that leaves port. The Courts of Inquiry are also capacies of improvement, and it deserves consideration whether they should not be empowered to dispose of pecuniary claims against shipowners up to a certain amount.

THE BENGAL FAMINE.

DURING the height of the Indian mutiny the British public was suddenly startled by the grave announcement that two hundred mutineers captured by General Neill, near Cawapore, had been pardoned and released by the civil nuthority, Mr., now Sir John, Grant. When a praiseworthy amount of virtuous indignation had been lavished on the author of this lamentable weakness, it was discovered that there was not one syllable of truth in the matter. No such body of mutineers had been captured. No one had been pardoned. Mr. Grant had never seen or corresponded with General Neill on any subject. The telegram was a deliberate, malicious, and silly lie. Of a similar character were stories circulated about the same time of the arrival in Calcuta of batches of mutilated Englishwomen; and these fictions induced the late Lady Canning to visit every lady who came down from the Upper Provinces after the fall of Delhi, and to satisfy herself that they all had returned with their cars and noses intact. We do not say that the sensational telegrams forwarded with a view of exciting the sensibilities of the English public on the famine are to be placed in this category, nor do we deprecate the concentration of our national symp thy and intelligence on a calamity which includes such splendid provinces as Bengal and Behar. But we do think it indispensable to warn readers of the danger of being led away by curt announcements of tailure here and of distress there, to condemn the highest authorities at Calcuta for madequate arrangements or delicient prevision. We have reason to know that the constant despatch of astounding telegrams, evidently sent with the object of forcing the Viceroy prematurely to show all his hand, has been emphatically condemned by intelligent public opinion on the spot, and nothing could be more unjust to rulers placed in situations of unprecedented difficulty than to found a vote of censure on their conduct without the fallest information as to their remedial measures. A languid official optimist may be the most onesi

been hastily interpreted in a sense directly opposed to that which the full reports warrant. We propose in this paper to give a synopsis of the means adopted or proposed by the Indian Government to stem the tide of famine, or to reduce it to a scarcity, and we begin by saying that we have condensed ample information derived from divers private sources and authenticated public documents, commencing with November and ending with the mail that

Just three months ago the Lieutenant-Governor of Bengal, with the full support and approbation of the Viceroy, laid down detailed instructions for the guidance of his officers, in a State paper by no means unworthy of his high reputation, of the impending calamity, and of the heavy responsibility weighing on himself and the Civil Service. No less than five great measures of policy were indicated. We begin with the second in the official category, as being that which has found its way into a speech on the unstines, and has challenged rubble attention in compatition with category, as being that which has found its way into a speech on the hustings, and has challenged public attention in competition with the Straits of Malacca, the 25th Clause, and the available surplus. We mean relief works, intended to improve the country permanently, and to support the labouring classes for a time. Our roaders are requested to bear in mind that India is emphatically a country of agriculture and tillage. Over a large area there are no such things as pasture lands distinct and separate from arable. There are no vast manufactories, no hives of industry, no miles of gallories beneath the earth which can divert the labour of thousands from the soil. The corn, rice, and pulse lands, and the fruit-gardens, support the labourer, assure independence to the tenant proprietors, swell the coffers of Zemindars, and reward the activity of dealers in country produce by land and water, over mormous areas guding rowded marts. But a considerable portion of the agricultural and labouring classes looks to harvest-time for emthe agricultural and labouring classes looks to harvest-time for om-ployment and pay. Men who have either small holdings or none at all are glad to cut the crops of their substantial neighbours, or even migrate in considerable bodies to districts thirty, tifty, or one hundred miles off, and return home well paid and well satisfied, after a month or six weeks of absence at the close of the cold season, and before the first furrow of the new agricultural year can The failure of the best harvest in December and January has obviously deprived this part of the community of the annual market for their labour. Government, instead of feeding these men gratis, as some philanthropists seem to think it was bound to do, has very naturally availed itself largely of the unemployed and surplus labour of the country; and the repeated annual councements that the relief works are "crowded" really mean that he belief and destricted Mindoward Mahanuard and the tenter. able-bedied and industrious Hindoos and Mahommedans are throngable-bedied and industrious Handoos and Manonimegans are inronging to throw up the earth-works in immunerable village and district roads; that, in Dinagepore alone, twenty thousand are being thus saved from idleness and indigence; that, so far from being compelled to labour, men are asking to be employed at home, so as to prevent the necessity for emigration to other provinces; that the projudices of even "Brahmans and high caste people against working on roads and tanks are rapidly disappearing," these men projudices of even "Brithmans and high caste people against working on roads and tanks are rapidly disappearing," these men having long been accustomed to handle the plough in their own fields; that workinen are fairly remnuerated by wages, or by the piece, as they prefer; that in Monghyr, a class of aboriginals who have become half-Hindoes have shown themselves roady and willing to do any work, to erect their own temperary huts by the roadside, and to est anything that may be offered them. them; that brick kilns are being burnt, old reservoirs are emptied of refuse, and now ones are being dug; and that improvements of all kinds conducive to the present health and future profit of the community are in hundreds of places devised, begun, and carried out. We ought at once to dismiss all idea that this relief work corresponds to labour in the stoneyard of St. Pancras at sevenponce a day, or under a hard-hearted Board of Guardians, or that a "cruel labour-test" should be summarily abolished. It cannot surely be contended that it is the duty of an Indian Government, at the first pinch of scarcity, to supply food gratis to every lazy Brahmin, to every stalwart Kurmi, and to every idle Kaivert. As regards the employment of women, no such epithet as "high appeared in any Times telegram, and we ought to insist on the strongest and most unimpeachable evidence in order to credit a loose statement that Hindoo ladies of rank, accustomed to count jewels in the sensus and to do no harder work than wait on their husbands at meal-times, have hitherto either asked for or been driven to "employment on the roads." One kind-hearted official, in order to meet the prejudices of well-born men against road-making in company with others of lower condition or caste, making in company with others of lower condition or casto, has actually contemplated setting apart certain works to which none but bene nati shall be admitted. And if women of the lower orders, with here and there a few boys, have either applied for or been allotted task-work, all we can say is, that the currying a few baskets of earth for good pay is a far lighter burden than has been imposed, all their lives, on Lakkimoni Chandálini and Puddomani News by the Oriental laws of domestic submission to a husband, or by the destitute condition to which widows are often reduced.

So much for relief works, and we wish we had

often reduced.
So much for relief works, and we wish we had space for a detailof some of those for which the Government is pledged either to
'advance or to provide funds. Connected with the works undertaken directly by the official departments are those carried out by
the Townships and Municipalities, in aid of which lears will be
made on favourable terms. These embrace schemes for the drainage or water-supply of large stations and towns, for embankments,
reservoirs, and wells in villages, and for the general improvement
of these hybrid aggregates of independent tenant proprietorships

and manorial privileges which, for want of a comprehensive term, we are contented to call "estates." But as yet not much has been done in this direction. Some loans for digging tanks have been asked for, and grants in aid equal to one-third of the local subscriptions have been promised. These measures, however, must be considered more as inculcating the duty of salf-help in critical times than as calculated materially to contribute to the salvation of the country.

A third division of the scheme of relief consists in giving full play to the natural operations of traffic and supply. Region establishment of order and the abolition of internal custom-duel, and by blishment of order and the abolition of internal custom-dues, and by fifty years of peace, the inland trade of our flourishing provinces has swelled to enormous dimensions. It would have been the most fatal error to announce that the Government intended to supersede all private enterprise and to take on itself, from the first, the supply of food to all markets and villages of Bahar and Bengal. On the contrary, it is a sound policy to stimulate commercial activity by removing every restriction, by communicating ample information, and by holding out special inducements and rewards. In this view tolls on ferries and at pikes have been reduced or abolished. The East Indian Railway is invited to carry gmin at half rates, the Government making good the deficiency. Zamindars, planters, speculators, and traders have been encouraged to import grain from a distance on easy loans and by advances without interest, on the condition, in the case of landholders only, that they will retail the food grains at cost price. The regular trader is permitted to sell at any figure which he can command in any market. It is probable that, as the tension increases, advantage will be taken of probable that, as the tension increases, advantage will be taken of this liberality by Englishmen who possess indigo and silk fac-tories, or by speculative Hindoos; and already we hear of native gentlemen and ladies of title laying in copious stores of food on their own account. A Co-operative Society has been started in Moorshedabad. In Rungpore five Zemindars are storing, between them, nearly 50,000 maunds of rice. In Dinagepore 40,000 maunds will be stored by two persons. In Maldah the manager of the estates of a minor is good for 10,000, and the influential and well-managed firm of the Watsons, in Rajshahye, has undertaken to buy the same amount.

But, after all, the main question with most English readers is, what has been the action of the Government itself? brings us to the two last measures for the prevention of the calemity the storage and the distribution of food for millions. —the storage and the distribution of food for millions. Now it will be recollected that, a very few weeks ago, public indignation was excited by a statement that the Government had bought 70,000 tons of rice on its own account, independently of the efforts of private trade. And even in some well-informed papers, no sarcasm was too cutting and no consure too grave for the pitiful economy which had provided such miserable grist for so huge a mill. Perhaps it did not occur to the majority of these critics that Lord Northbrook was not bound to make the fortunes of a few dashing speculators or to disorganize the rice markets more than he could not halp, by appropriate in the Calcutta Ginetic the great toursery. not help, by announcing in the Calcutta Gunette the exact tonnago of rice with which he had determined to flood the country from Burmali, Madras, and Cochin China. And it now turns out, as was all along assumed by a few experienced administrators and writers not thrown off their balance, that the Government has made arrangements for the supply of more than seven times that tonnage in regard to which we were favoured with such a that comings in Figure to which we were involved the such a series of screams and shricks. By converting 440,000 tons into corresponding Indian weights we get an amount of one million one hundred thousand of maunds; and, assuming that this rice has been purchased or contracted for at the low figure of six shillings per maund, the Indian Exchequer is already committed to an out-ay, for rice alone, of three millions of our money. We understand that two millions have already been paid down. It is true that the that two millions have already been paid down. that two minons have arrange been paid down. It is true task to fovernment may eventually recoup itself by selling a portion of these purchases to private traders; but this is uncertain, while what is cartain is that, for weeks and months past, the Commissioners of three divisions, who fill offices analogous to those of French Prefects, have been busily engaged in marking out centres of relief in every district and in every subdivision of a district, in swetting or hiring places for storage, and in preparing for that worst and satisfasted places for storage, and in preparing for that worst and anticipated contingency when the ruling power will have not only to transport, store, and sell the grain at fair prices, but may have to weigh it out for nothing, and perhaps cook it for the starving and halpless. Three distinct phases of the apprehended visitation have been pointedly held up to the district officers as possible, and even probable. There are to be a few large centres or storehouses for a "mild famine." These will be multiplied in number, though the family decreased in size of the family appreach the family appreaches the family appreache able. There are to be a lew large centres or storenouses for a "mild famine." These will be multiplied in number, though possibly decreased in size, if the famine spreads. And if the worst happens, "the number of relief centres will have to be largely increased, so as to be within reach of all." After this, we shall leave it to our readers to say if the Government has failed, in theory at least, to face the danger and devise the remedy. Already do we hear of gedeens or storehouses being hired or built at well-known stations, and at marks and obscure rural villages with odd-sounding names that would delight a philologist as being purely Hinds, purely Mahammedan, or a hybrid compound of an Aryan and a Semitic language. In Dinagepore, Maldah, Rajahaye, Ratandeya, Moorshedabad, a large part of Bhaugalpore, Monghyr, and plots of some other districts, the grain had arrived, in no inconsiderable quantities, more than six weeks ago. It is very desirable that the real distinction between "Relief Works," which have been already commenced, and "Helief Centres," which have been already commenced, and "Helief Centres," which may begin to work at any time, should be home in mind. The works of realmaking and tank-clearing are, as we have explained, intended to dust off the able-hodied and willing portion of the community. At the Reliaf Centres, whenever they may come into operation, no one will drawn of exacting labour tests. The food will either be given out to respectable shopkeneers, henevolent Hindoos, and independent Englishmen, who will retail or distribute it as may be arranged, or else it will be doled out, morning and evening, by the officials themselves, to the widow, the orphan, and the religious mandifacts, as well as to that considerable class of Hindoos and Mahommedans who have neither lands, nor gardens, nor lucrative trades to fall back on, but who, in the very best of seasons, live from hand to mouth on their daily earnings, own two suits of light clothing, a hookah and a brass pot, and cook, eat, and sleep in the one apartment of a thatched hut.

We have endeavoured to show that Government has assisted, premeted, and rewarded private enterprise; that it has set an example to native benevolence; that it has given employment to unoccupied native industry; and that it has by no means forgotten that its first duty may be, at any time, to keep the population alive. But after what we have been told about the progress of the famine outstripping the aluggish action of the State, it is an agreeable surprise to find that, up to the end of the third week of January, no actual cases of men dying from want of food had been discovered. Those spoken of in a telegram as having occurred in Sarun or Chuprah turn out to be ordinary deaths; and the active officers riding about the country to detect and report the first cases of starvation have been able to find nothing more serious than the following. A beggar with one arm, in a fit of pique, threatened to commit suicide. A lad was found crying because he had "nothing to eat," and was immediately relieved. A native was actually seen to suck some of his own augar-cane; but, as the report naïvely adds, this could hardly be quoted as an "instance of real distress."

real distress. We do not, however, forget that famines, like conflagrations, are fearfully rapid in their progress. High prices in one week become scarcity in the next, and famine in a third. It is indisputable that a large tract lying between the left bank of the Ganges and the mountain-ranges of Nepaul is now causing anxiety at head-quarters, and that all the tried abilities of Sir Richard Temple and his taff are taxed to pour food and grain into Northern Tirhoot, into Chumparun, a district owned, like the country of Sutherland, almost by one huge proprietor, the Bettia Raja, and into parts of Sarun and of Bhaugulpore. This area is some way from the river, and is not plerced by any rail. But the country has many fair-weather roads, and is very easily traversed at this season. The population is not dependent on rice, but can eat wheat, the coarser cereals, and the various pulses, which can be supplied in ample quantities from Hindostan proper and the Punjah. The worst time is, however, yet to come. By the middle or end of March the cold weather crops will be ripe, and most of them cut and carried. And there must come a period of great auxiety and expectation before the first spring showers of April and May, which procede the periodical rains of June, and admit of the commencement of agricultural operations. Even if the early rain is favourable, no further crop can be reaped, under any possibility, till the hearinning or middle of August. We have therefore yet the beginning or middle of August. We have therefore yet aix months of extreme tension. It is next to impossible that in this limit of time deaths should not occur from weakness, from diseases induced by low living, and from sheer want of food. Besides the large class which supports itself by habour, and not by rents and profits, there are endless varieties of mandicant Brahmins, hedge priests, Hushtums, Ikuragues, and Faquirs whose lives are spent in wandering over the country and in seeking alms. The Government cannot be deputing its officials in seeking alms. The Government cannot be deputing its officials to run after these men, or see that they do not faint on their to run after these men, or see that they do not laint on their travels or are not driven away by villagers of different castes and antagonistic feelings; nor can it do more than place food as near as possible to towns and populous villages. Perhaps those who threaten Lord Northbrook with impeachment if a single life is sterified will just take the trouble to send for any Poor Law Report and ascertain for themselves, not how many souls died during the Irish famine, but how many perished in London in one twelvemouth within half-an-hour's reach of Boards and Relieving Officers, of benevolence with money in both its puckets. one twelvemonth within half-an-hour's reach of Boards and Relieving Officers, of benevolence with money in both its pockets, and of a press that never nods. After all that has been said about prohibiting exports and insufficient supply, we have reason for believing that abundant supplies will have been retained in or attracted to the country, and that the one great problem will he how to get them up to the masses. But in any view of the case, while it is the part of the press to concentrate the scattered rays of public opinion into one focus on this solemn topic, it is also its duty to abstain from condemning such eminent public servants as Lord Northbrook, his whole Council, and the Lieutenant-Governor of Bengal, till we all have before us some particulars which might have been made public long ago. When the records "leap to light," it will be time enough to say whether our Indian statesmen shall or shall not be shamed.

THE MISSION.

FIRE Mission which began on Sunday mask and ended last
Touchey might with advantage have been exempted from
homopopus, controversy. But it is one of the conditions of an
limitational Chapter that it can do nothing in a course. The

Roman Catholics, we believe, hold similar exercises every year, and among some of the Dissenting sects they are almost peronnial; but when a Mission is begun and ended in St. Paul's Cathedral, it falls at once within the range of descriptive reporting, Special Correspondents, and leading articles. These who would willingly have let it pass without comment are furned therefore to follow suit, if it be only to point out the narrowness and the ignerance of

much that has been written on the subject.

The first remark which suggests itself is so obvious that there would be no need to make it if it were not constantly ignored. alike by the friends and the enemies of the Mission. The desire to hold a Mission at all is tantamount to a confession of at least partial failure. Extraordinary unwhinery is not called in until th ordinary machinery is supposed to have proved insufficient for the work to be done. The exultation with which the Mission has been hailed by many excellent persons resembles the joy which invalids sometimes show when they are ordered to take atrong medicines; "Nothing short of calonel will do for ma," says the patient proudly, and for the moment he seems really raised a step or two in the hierarchy of moral beings by the self-conscions presession of a poculiarly aggravated disorder. In theory an Established Church with a complete parochial system has no business to need a with a complete percential system has no business to need a Mission. Its ordinary organization is professedly designed to leave no room for such exceptional raids upon sin and unbelief. The whole country is percelled out amongst the clergy to the intent that this sort of warfare should be regular and unintermittent. Itoman Catholics or Dissenters stand in this respect in a different position from members of the Church of England. Their religious organizations are not coextensive with the population; they are minorities whose aim it is to make an impression upon the alien majority around them. But the Church of England has had sither the exclusive or the predominant control of the spiritual interests of Englishmen for centuries, and to say that a Mission is wanted is to admit that this control has not been turned to the best account. On the other hand, it may fairly be contended that, as the count. On the other hand, it may fairly be contended that, as the Church of England has allowed a large portion of the population to get beyond the influence of religion, there is now no alternative open to her but either to make no effort to recall them, or to resort to means which are more or less alien from the temper of to resort to means which are more or less alien from the temper of her ordinary action. It is no conclusive argument to say that, wherever there is a church and a clargyman, there a Mission in the true sense of the term is perpetually going on, or that Lent and Advent, and every Sunday as it comes round, are so many stimulants to the flagging energy of Christian people. The advocates of the Mission have an answer ready. In every great town at all events there are thousands and tens of thousands who never enter a church, who have no acquaintance with the ecclesiastical sensons, who make no difference between Sunday and week-day, execut that on the Sunday they send more ecclesiastical seasons, who make no difference between Sunday and week-day, except that on the Sunday they spend more time in the public-house. These are not the more black sheep of the parish, the recognized members of a criminal or semi-criminal class; they are persons who, except as regards religion, do not differ greatly from the church-going, Sunday-keeping population among which they live. But in the matter of ratigion they have somehow stepped out of knowledge. If they are to be brought within knowledge once more, it must be by a new agency of some sort. The mere fact that churches are standing all around will effect nothing. The sight of the heaven-pointing spire, and the open door, and all the rest of it, is perfectly familiar to them already, and is not in the least suggestive to them of going inside. And supposing they did go inside, is it certain that going inside. And supposing they did go inside, is it certain that they would be much the better for it? The ordinary services of they would be much the better for it? The ordinary services of the Church of England are not specially adapted for persons who have all their religion to learn. They presuppose a religious childhood and youth, some familiarity with sacred books and doctrines, an intelligent appreciation of sacred ceremocies. No doubt the Anglican service is decent and orderly, and appeals rather to the reason than to the emotions. But its possession of these qualities is no passport to the affection of persons who think its decency duliness, and who, if open to relicious appeals at all, are only open to them through those very emotions of which the Prayer Book makes cautious and sparing use. Whether a Mission does any lasting good to the class in question is a point which it is very difficult to determine. But uncertainty on this head is quite consistent with the admission that no other against is likely

This reasoning good.

This reasoning good far towards disposing of Mr. Harry Jones's complaint that the Mission is "out of harmony with the pastoral system of the Church of England," and is likely, if successful, to produce "an undesirable type of religion." The rector of St. George's-in-the-East ought to know as well as most mentifiat there is a vast region within which the pastoral system of the Church of England has practically no existence, and that as regards the dwellers in this region the choice is not between a desirable and an undesirable type of religion, but between religion and no religion. Mr. Harry Jones is probably not prepared to maintain that unless religion can be had of the precise type which he himself likes, it had better be dispensed with altogether. What he says may be applicable to persons who are already under religious influence, and to Missioners whose object is to win these persons over to more complete acceptance of clarical authority and a blinder religions who at present are under no religious influence whatever, and as to whom, therefore, at all events from a clerical point of view, it is a clear gain that they should be brought even under "the continuous

direction of a parson or a priest." Seene sensible remarks on this aspect of the Mission are made by a "West End Incumbent," whose letter was published in the Times of Saturday last. Granting, he says, that the Mission in the hands of some of the Ritualists aims at bringing people to confession, and that confession is, as he himself holds it to be, "unscriptural and enfeebling," still "the Ritualism which resorts to confession is at any rate more likely to be a sincere and true thing than that in which seeing and hearing are all in all; and sincerity, earnestness, and truthfulness are qualities worth eliciting and implanting, even at the cost of having to tolerate what we do not like in the forms and fashions of their manifestations." If this is true where the choice lies between sincere Ritualism and no religion at all. The objection that "to try to alter a religion worthy of the name is to try to alter a man's character ignores numberless instances in which a man's religion, and his character with it, does undergo a sudden and incomprehensible change; but if it were true in itself, it would be open to the same answer. The persons to whom the Mission is primarily addressed are persons who have no religion to alter. The worst that can befall the Mission is failure in his attempt to give them one.

What may be called a favourable estimate of the Mission as regards its main purpose is perfectly compatible with disapproval

What may be called a favourable estimate of the Mission as regards its main purpose is perfectly compatible with disapproval of particular methods of conducting it. To say that any religion is better than none is not the same thing as saying that one religion is as good as another. The man who disapproves confession or revivalism will not cease to disapprove them because they form part of the Mission machinery. But he may do this without denying that, if either confession or revivalism can save men and women from living and desire like the brutes the missions. from living and dying like the brutes, the mischiefs attributed to it may well be forgotten in the good which it effects. Still it is important to bear in mind that the intentional introduction of excitement into religion is open to grave question, and that even on the most favourable estimate of it it is a weapon singularly liable to abuse. If this is admitted, there are three features in the London Mission of 1874 which will hardly stand the test of calm examination. The first is its attempted universality. When exciting services have to be kept up in a great number of churches at the same time, it is impossible to choose the clergy who conduct them with a great number of churches at the same time, it is impossible to choose the clergy who conduct them same time, it is impossible to choose the clergy who conduct them with as much care as if only a few such services were being held. Now upon this careful choice the immunity of the Mission from the bad side of religious excitement largely depends. The "after meetings" of last week are open to criticism, even if it be conceded that those who had the management of them were always men of prudence and self-control. But if these qualifications were absent—and it is strange if in the case of the younger and more enthusiastic Missioners they were not sometimes absent—the risk would be very much greater. It is a further drawback to a Mission which is going on at the same time all ever London that it provokes a kind of rivalry between different churches in the amount of excitement provided. between different churches in the amount of excitement provided. No man likes to have his services set down as slow, and in labouring No man likes to have his services set down as slow, and in abouring to avoid this charge the bounds of good sense and calm calculation of consequences may easily be overstepped. A second objection is the want of any clear understanding as to the class to which the Mission was addressed. That persons ordinarily beyond the reach of religious teaching should be brought within it by a special effort, in the hope that when the strain is relaxed some traces of the effects may be left behind, is one thing; that persons ordinarily subjected to religious teaching should be subjected annually or biennially to special emotional influences is quite another. It is certainly not a thing to be desired that a Mission, with its accompaniments of "after meetings" and personal appeals, should become part of the ordinary ecclesiastical machinery and be applied to every congregation as a matter of course. A man just saved from drowning may be all the better for a glass of brandy, but if he takes to dramdrinking as a remedy for languad circulation, his health will get worse instead of better. The third objection is the seeming absence of any distinction between the application of excitement to a class which is not usually subject to it in any form, and its application to a class which is completely habitmated to it, and that at a time when this customary excitement is at its height. The residual proving to avoid this charge the bounds of good sense and calm calculation at a time when this customary excitement is at its height. The working men or women whose lives are absorbed in a dull routine of petty cares may be raised out of themselves by the attack of the of petty cares may be raised out of themselves by the attack of the Missioner, and may profit by the sudden rush of unaccustomed emotion. But where the persons appealed to live in a condition of recurrent excitoment a different course ought to be pursued. We have no wish to speak harshly of such services as those which were held nightly at St. Peter's, Great Windmill Street. They were prompted by a natural desire not to leave out of the scope of the Mission a class which certainly needs it as much as any, and, as far as intentions go, those who organized them deserve every profits. But in so far as these certainly needs it as much as any, and, as far as intentions go, those who organized them deserve every proise. But in so far as these services were founded on the hope that emotions as far removed as possible from religion might be changed into religious emotion by the mere transfer of the subject of them from the lightened casino to the darkened church, or that religious impressions begun under such associations would be likely to have any lasting influence, they seem to have been a striking instance of misdirected seal. If the class addressed is to be caught at all, it must be singly, not in crowds, in the inevitable depression of the morning, not in the midnight excitement with which it is already but too familiar.

HIGHLAND CONSTITUENCIES.

THERE used to be plenty of animation in a close contest in a great city constituency, when party passions ran high and neither of the candidates took their stand pharisaically upon extreme purity of election; when every public-house was converted into a committee-room whose doors stood open night and day; when the grimiest streets were brightened up with brilliant displays of bunting; when respectable citizens and unenfranhised ragamuffins flaunted alike in the colours of the parties; when the walls blazed with variegated posters covered with election squibs; when bills steeped in party venom were scattered broadcast; when either side had its battalions of mercenaries always eager for the fray. Still, animated as those contests were, they could scarcely be said to be romantic. There was little of romance in the exchange of savage blows and foul abuse with which the rival mobs initated the frank personalities of their betters; there was little of romance in broken heads and streaming blood, and drunken partisans staggering along the pavements and reeling into the gutters. And, whether they were romantic or the reverse, those urban contests have now become things of the past. Now that men vote on the sly, there is very little use in trying to influence them. Committees have taken to sitting in school-rooms in place of beer-shops, and the public-houses are compelled to shut up at ridiculously early hours. There are few means of getting up the steam, or stirring the blood to fever-heat. Candidates steer clear of the old personalities, and observe the distant courteey of dignified enemies. Their immediate supporters imitate their example, and if the masses do not as yet fully acknowledge the responsibilities of their new privileges, at least they have made some progress towards a well-bred indifference of demeanour.

The romance of the old elections was chiefly to be found in the outlying districts of those sister kingdoms which have been forced to keep house with England whether they like it or not. There was much

The romance of the old elections was chiefly to be found in the outlying districts of those sister kingdoms which have been forced to keep house with England whether they like it or not. There was much genuine feeling in a faction fight in one of the ancient principalities of the Hibernian Kinglets, or in a borough where the influence of the propular Church clashed with that of a domineering aristocracy of aliens. The Church blessed the banners for the holy war, and the priests at the chapel doors spiashed holy water over the faithful. The peasantry and squatters in outlying baronies came trooping in over moss and mountain. To do them justice, they were but little influenced by sordid considerations, although notes and soveroigns might be flying about. They swallowed down drink after a fashion that would have made the Saxon of the city gasp; but the pothecen came into play as a mere incidental stimulant. They cracked each other's skulls with shilledghs either from the most holt and conscientious motives, or from the sheer love of sport. If one of them chanced to be trodden to death under the heavy beot-heels of his enemies, he fell a martyr to his Church or his clauship, and was as sure of Paradise as any green-turbaned descendant of the Prophet who fell in combat with the infidel. Ireland is a very different country from Scotland; and as the romance of elections in the Scottish Highlands is of a very different mature from that of an election in Glalway or Tipporary. Still, without going into minute distinctions, we may observe that elections in the Highlands are pretty sure to preserve their romantic aspect minufluenced by the course of Radical legislation. You may give a vote to every child of either sex who is able to put a mark on a voting-paper; but nature is impracticable beyond certain limits, and refuses to be reformed beyond a certain point. The sterility of the country and the swageness of the secuery take a great Highland election out of the commonplace category of ordinary machinery of a canvass. Th

county.

The constituents in those counties have characteristics as distinctive as the counties themselves. It is easy to plumb the shallow political intelligence of the quick-witted artisan who has educated himself with his greasy paper over his pot of being, and who has just learned sufficient to be sure that there can only be a single side to a question. But it is not so easy to fathom the mind of the man who thinks seriously although he thinks slowly and soldon, and who has lived the best of his days like a harmit, beyond the range of all external influences. Look at the lives led by the outlying electors of Inverses shire. Many of them are shepherds and

bessers; they inhabit an isolated cottage in some remote gien, a cottage that is only approached by some faint sheep track. The nearest neighbours on one side are beyond a great mountain range; while for miles upon miles on the other there stretch the unpeopled solitudes of a deer forest. The nearest carriage road is eight miles off, and that is only travelled three days in the week by a mail-cart that carries passengers. The church and school are at twice the distance, so the children must trust to the parents for their clucation, and the father can only occasionally join in the Sunday gossip in the parish churchyard that expands the ideas of some of his fellow-parishioners. His cottage is ten miles from the nearest hovel where they sell whisky: not altograther an unmixed some of his fellow-parishioners. His cottage is ten miles from the nearest hovel where they sell whisky; not altogether an unmixed good to him, for, although it may be all the better for his purse and constitution, he misses another means of social enlightenment. His work is arduous; he is afoot among his sheep from the early morning until the dusk. By that time he is weary enough to be ready for bed immediately after supper, even did he care to afford himself candles to read by. At the best of times, and in the height of the summer, it is but seldom that a stray copy of the county paper finds its way to the head of the glen. In the winter snow-storms he is almost as absolutely out of the world as the crew of some Arctic discovery ship that has been laid up in an ice-dock in Melville Bay. The man has very possibly had fair schooling in his boyhood. More likely than not, he comes from somewhere on the Southern border, so that English is his native tongue, and consequently he can read the papers fluently, although he may not be Southern border, so that English is his native tongue, and consequently he can read the papers fluently, although he may not be quick to take in the sense. He is thoughful by nature, as you may see in his face, which has much the same puzzled intelligence of expression that you remark in the venerable rams of his flock. No doubt he thinks much after a fashion of his own, as he goes "daundering" about after his straggling sheep, or stretches himself to bask in the hot sunshine, while he leaves his collies to look after his charge. But what ideas can he have formed on the great questions that affect the fate of Ministries? what views has he arrived at with regard to the extension of the suffrace in counties, or the distribution of the surplus revenue which Mr. Chadstone takes credit for accumulating? He has not even local interests, however confined, to concern himself about; for the only local rate he is confined, to concern himself about; for the only local rate he is interested in is the tax which limits the number of his four-footed aides-de-camp, and that dog-tax affects his master in the first place. But, whatever his ideas may be, he is pretty certain to cling to them with a constancy proportioned to the time he has bestowed in thinking them out. Theoretically, it is likely enough that he may be a Liberal; but practically he is a tolerably staunch Conservative—that is to say, he never in his life did anything in a hurry, and he is not going to decide to turn out the sitting member on a suggestion made on the spur of the moment. Such as he is, he may be assumed to be an advanced thinker and to have sound information on contemporary politics in comparison with many of his fellow-voters. At all events he talks and reads English, and, as we have said his cottage is no more than eight mountain niles from a high read. Many of his independent fellow-electors, on the other hand, "have no Sassenach" whatever, and, as there are no Celtic journals in circulation, they can have no opportunity of aides-de-camp, and that dog-tax affects his master in the first place. Celtic journals in circulation, they can have no opportunity of informing themselves on public affairs. Many of them prefer the old religion, which takes no especial trouble to enlighten them. Many of them, again, live in scarcely accessible islands, where the arrival of intelligence from the capital and the outer world depends on the winds and tides, and the precarious movement of sailing

Only conceive the labour of canvassing such a constituency, even under the most favourable circumstances. Imagine canvassing it in the depths of winter, when the gentlemen who aspire to represent it are hard pressed for time. You have to post long distances in dogcarts, seeking relays at the widely separated inns, where the stable establishments are kept on a peare footing except during the teurist season. The roads are carried along in the depths of glens where the snow-drifts gather in heavy masses. They are carried across formidable ferries, where, if you bribe the boatmen to imprudence, your business being urgent, you are not unlikely to meet the fate of Lord Ullin's daughter. So much for what is called the mainland. But if you canvass the voters on the shores of the mainland lochs, you are committed to canvassing the islands too; for there is nothing about which an islander feels more sensitively than the insinuation that his home lies out of the world. That island canvass means chartering some crank little screw; beating out into the fogs among the swells and the breakers; taking flying shots even under the most favourable circumstances. Imagine canvassing island canvass means chartering some crank little screw; beating out into the fogs among the swells and the breakers; taking flying shots at low reefs of inhabited rock, enveloped in mists and unprovided with lighthouses. Landing-places are almost as scarce as light-towers, and you may have to bob about under the "lee of the land," in impatient expectation of establishing communications with it. When you do get to shore, you must be hospitably fitted by the minister and the schoolmaster, the doctor and the principal tacksmen, until, what with see squeamishness and the strong spirits, it becomes simply heroic to preserve the charm of your manners. Moreover, you had much better not make your visit at all than ent it uncivilly short. Our friend the shepherd may have made up his minit to support you; but you may rely upon it that he will promise taking until you have set yourself down for a solemn "crack" with him. And all through the interview you sit on thorus, knowing how much has to be done before night, and how for removed you are from your sleeping-quarters. Nor does the tensance by any means come to an end with the canvaes. The people may be slow to promise, but they are just the men to keep.

and it must be a grave danger indeed that will prevent them from recording their votes. So, on the great day of the pull, you have some thousands of them heading for the various polling-booths in resolute defiance of obstacles interposed by topography and climate. They climb over mountains and plod over move fleda, wade mountain-streams, navigate locks in crank cobies, and cross raying estuarios in rickety flat-bottomed forry-boats; so that, should the winds and the weather interfere too seriously with the exercise of the electors' political rights, the polling of a great Highland constituency may possibly have a gloomily dramatic finale.

ECCLESIASTICAL GEOGRAPHY.

THE events of the last two or three years have made the names of German Bishops more familiar to us than usual. Some German Archbishop or Bishop is always doing something which gets not only into the German, but into the English, newspapers. A little time back they were most commonly disliking and accepting new theological dogmas; now we commonly hear of them as falling between the fangs of the civil power, and finding their way to prison for some breach of laws a little stricter than the Constitutions of Clarendon. Our German friends tell us that it is now to prison for some oreach of laws a riche stricter than the Constitutions of Charendon. Our German friends tell us that it is now all "Hie Welf: hie Waibling," and imply that "Waibling" is the right thing to shout. We do not doubt that it is; still we cannot wholly choke a charitable wish to let some crumbs from our table wholly choke a charitable wish to let some crumbs from our table fall to the Welfen. It has been ingeniously suggested, in answer to a rationalizing question what became of the welfs own cubs when she suckled Romulus and Remus, that those Welfen become the parents of all later Welfen. Shut out from their natural home and their natural nourishment, they took to a way of yelping and howling at their supplanters on the Palatine, and at everything which has in later times kept any shred or survival of power or titles sprung from that first wrong. In their case the habit must be looked on as at least pardonable, and we might be tempted to extend some measure of the same pardon to those who in what, by a certain flight of historical imagination, we may call the same cause, are just now being fined tion, we may call the same cause, are just now being fined and sent to prison. In the abstract we cannot approve of anybody breaking the law, but we feel a little mercy when the law would almost seem to have been made on purpose to tempt people to break it. But after this slight outpouring we will try to improve the occasion in quite another way. The struggle—"si rixa est, the occasion in quite another way. The struggle-"si rixa est, ubi tu pulsas, ego vapule tantum"-which is now going on brings forcibly to the mind some differences in one aspect of the history of three of the great countries of Europe. The chief criminal or martyr just now is an Archbishop of Posen with a hard name, which we have no Slavonic scholar at our elbow to teach us how to spell in the most correct way. Now the fact which strikes us as remarkable is that there should be such a thing as an Archbishop of Posen at all. The fact that there is an Archbishop of bishop of Posen at all. The fact that there is an Archbishop of Posen marks something in the history of Germany—for we must count Prussian Poland as having for our purpose become part of Germany—which is unlike the history of either France or England. There is nothing in France or in England at all answering to an Archbishop of Posen, unless indeed it be the quasi-archbishopric of Westminster. When some years back, at the other end of the Prussian dominions, an Archbishop of Köln also underwent a kind of martyrdom, the description was quite familiar. Bating the years of general confusion, there had always been Archbishops of Köln from a time that the memory of man runneth not to the contrary. But to any one familiar with the older ecclosiastical geography, an Archbishop of Posen seems something altogether strange. We ask at once what has become of the primatial see of Poland, the see whose Archbishops crowned something altogether strange. We ask at once what has become of the primatial see of Poland, the see whose Archbishops crowned of the primatical see of Polaria, the see whose Archibetops crowned the King when he was elected, and themselves held more than kingly power in the time between the death of one King and the election of another. How has the Suffragan of Posen supplanted his Metropolitan at Guesen? We look to our Potthest, our Wegnosiaer, our trusty guide in these matters, and we find that Guesen does in a manner still go on, that Gnesen and Posen are joined in some mysterious way, and that the Primate is strictly Archbishop of Guesen-Posen, as we have heard of Princes of Sloswick-Holstein. But he is certainly best known to the world as Archbishop of Posen; the archiepiscopal residence is at Posen, Gnesen being cut down to being the dwelling-place of a Weibbischof. If therefore Gnesen has not utterly vanished, it has at least had a suffragan very largely to knock under to Posen. When we go suffragan very largely to knock under to Posen. When we go further afield through the German Empire, we find many other strange episcopal phenomena. We have heard a good deal lately strange episcopal phenomena. We have heard a good deal lately of the bishopric of Fulda, which sounds strange in ears which best know Fulda as the preatest of abbeys; still Fulda became a bishopric before the general return to chaos, and its promotion of Else under one Hanny and of Patashopouch under continuous tion, if promotion it is to be reckoned, answers to the promotion of Ely under one Henry and of Peterborough under another. But, as we go on, we shall come across personages much more strange than a Bishop of Fulds. We are startled by hearing of an Archbishop of Freiburg and an Archbishop of München. Again we find that München, modern as it sounds, has something assistant tacked on to it, in the form of the ancient see of Freibing, the see of the famous Otto, the historian of his imperial numbers. But as (lets pares were the rallium nor hore the cross. nophew. But as Otto never wors the pallium nor bore the cross, an Archbishop of Preising purs and simple would seem only one degree less wonderful than an Archbishop of München-Freising. The solid Mineter of Limburg on the Laha might seem well

worthy of its promotion; still its episcopal rank dates only from a Bull of 1821. And if some places have risen others have fallen; we have known men from lands and churches not specially marked for devotion towards prelacy moved almost to tears at finding that the metropolis of fermany was shorn of its honours—that primatial

metropolis of Germany was shorn of its honours—that primare.

Mainz had sunk to a simple bishopric.

Now there is nothing like this in England or in France. Canterbary and York still keep their ancient honours. Lyons is still the seat of the Primate of all the Gauls, and Rouen of the lowlier Primate of Normandy. The Metropolitan, not of Gaul or of Normandy, but of France, is still at Rheims, ready doubtless to crown a King whenever a King shall come to be crowned. In short, the eccle-Ring whenever a king shall come to be crowned. In short, the ecclesiastical geography of Germany has gone through changes to which England and Francesupply no parallels. The French diocesan arrangements are the most ancient of all. It is wonderful how little they have changed from the very earliest times. The only changes which they have gone through have been the comparatively easy and harmless changes of simple division and simple union. In the fourteenth century several of the provinces and dioceses of Southern Caul were divided. Several new bishopries were founded, several old bishopries were raised into archbishoprics. founded, several old bishopries were raised into archbishoprics. In the seventeenth century the province of Sens was divided, and Paris, already for some years the temporal capital, was raised to the rank of an ecclesiastical metropolis. By the Concordat at the beginning of this century a number of sees were suppressed, and their diocesse united to others. But all this has been simple division and union. From the days of St. Martin till now there has been handly why chopping and changing. There have been very few cases of the removal of a see from one city to another. There have been very few cases of the formation of a diocese out of scraps of two or three others. A French episcopal city has commonly always been an episcopal city: its diocese still commonly reof scraps of two or three others. A fronch episcopal city has commonly always been an episcopal city; its diocess still commonly represents the extent of the civil jurisdiction of that city in Roman times; or, if a neighbouring see has been suppressed, its diocess represents the extent of jurisdiction of two Roman cities thrown into one. Ages back, by one of the rare exceptions, the see of St. Lo was moved to Contances, and by medern arrangements the diocesses of Contances and Avanaches have been thrown into one. This is in France a large arrangement of charges that it is a triffe to This is in France a large amount of change; but it is a trifle to such a change as the creation of an archbishopric of Freiburg, with a diocese made up out of scraps of the dioceses of Constanz, Basel, Mains, Speier, Strassburg, Worms, and Wurzburg; and it is a small amount of change compared with what most English dioceses have gone through. While such a change as that from St. Lo to have gone through. Coutances is the exce inces is the exception in France, it has been rather the rale in and. A large number of our bishoprics changed their seats England. England. A large number of our bishoppies changes their seats twice or thrice before they settled down where they are now. In their present form our episcopal sees mainly represent an arrangement of the eleventh century. Since then, two new bishopries were added in the twelfth century, and six-permanently five-in the sixteenth. Of the creations of the first Henry, the discount of the first Henry, the discount of the first Henry is the sixteenth. Carliale represents a territory then lately added to England; that of Ely was a simple division of Lincoln. The foundations of Henry the Eighth carried with them a certain amount of chopping and changing, as in the cases of Bristol and Chester; still simple division may be said to be the rule. The changes of our own day have united an utter contempt for the historical boundary of diogeness with a should appear a property of the material political states. dioceses with an almost superstitions reverence for the seats and titles of their Bishops. We have founded two new bishoprics after the precedents of the two Henrys; we have actually supsed none, though (floucester and Bristol have now but one top. The hend of Bristol, the city, has been joined to Gloucester, while its body, the county of borset, the ancient discuss of Sherborne, has been joined back again to Salisbury. In the way of chopping and changing we have creations so amazing historically as the present discuss of Oxford, and so amazing both historically and practically as the present discuss of Rochester. In this last case we get the highest development of reverence for the ancient see combined with contempt for the ancient diocess. Eather than change the title and seat of the Bishop, the see is placed on one side of an estuary and the diocess on the other. The Bishop must live away either from his see or from the bulk of his discess. To get from one to the other, he must go through the discess of another Bishop.

In France then we may say that the old arrangements have been,

as compared with either of the other two countries, left un-disturbed. In England we may say that the arrangements have disturbed. In England we may say the the last change has been changed over and over again, and that the last change has consisted in upsetting things while keeping their names. In Germany there has been a clean sweep. In a large part at heast of consisted in upacting things while scoping their names. In Germany there has been a clean sweep. In a large part at hust of the country the old arrangements have been sweep away, and new ones have been used with very little reference to them – new arrangements which, when they happen to agree with the old ones, do so almost accidentally. Now what are the causes for these differences between the ceclesiastical arrangements of the three nations? They lie in the distinctive features of their history. In Gaul the history was placed from the herinaging in the chief nations? They lie in the distinctive features of their history. In Gaul the bishopries were placed from the beginning in the chief town of each district, and what was the chief town of each district in the days of St. Martin is commonly the chief town in the district still. In England most of the ancient bishoprice were histoprice of tribes rather than of cities. In the elevanth century their seats were systematically moved to the largest towns, but, unlike the cities of France, what were the largest towns then are very commonly not the largest towns now, and the systematic removal of the elevanth century has never been imitted since. Bolds Trance and England, however, could make their scalesiastical

arrangements just as they pleased, as a domestic concern within the bounds of a single kingdom. But while France and England here bounds of a single kingdom. But while France and England have been in different ways getting more and more united, Germany was till quite lately getting more and more dismited. In France and England every Bishop was a subject of the same King. In Germany the Bishops themselves became princes, and their dioceses might be at any degree of cross purposes with the territories of other princes. In a great part of Germany the old bishoprics were altogether swept away in the revolutionary time; the present sees, even if fixed in the same places, must be looked on as new creations. In Germany the whole thing has been reconstructed according to real or supposed modern convenience: and this has according to real or supposed modern convenience; and this has involved an almost utter sweeping away of the ancient arrangements. In France modern convenience has allowed the ancient arrangements to remain with what, as compared with Germany, are but slight changes. In England, after the build change of the eleventh century, we have made a series of compromises, trying somewhat awkwardly to combine present convenience with reverence for the past. The result has been in one age a diocese consisting of the city of Bristol and county of Dorset, in another age a diocese of Rochester of which St. Albans forms a part.

In all this we have spaken roughly and generally; it would be easy to find exceptions in all these cases where some particular cause has affected some particular cities or districts. But we think that the main facts of the case will be found to bear out the broad distinctions which we have drawn between the history of the ecclesiastical geography of the three countries.

THE PANTECHNICON:

PHE Pantechnicon was built with a view to security against tire, and not only has it perished, but it exposed the district in which it stood to the danger of general conflagration. It had retained, among many imitations, its original reputation of being "the largest, the safest, and the most fireproof warehouse in the metropolis." It became the receptacle during some months of the year of the most valuable part of the contents of many of the houses of the nobility and others, whose residence in town depends on the Parliamentary Session. Thus on Friday in last week the building was completely filled with property of all kinds, of a value building was completely filled with property of all kinds, of a value which only the owners themselves could estimate. The area of which only the owners themselves could estimate. The areas the building was not much less than two acres. It was built in 1830, and when finished was said to be the most complete thing of the kind ever constructed. If y means of peculiarly formed and solid iron pillars a complete iron support was produced from the ground through the intervening floors to the roof. The whole of the cuilings were lathed with iron rods and covered with a competitive produced for the configuration. sition which, as was hoped, would resist the fiercest fire, and would not erack or fall down if water was thrown upon it while hot. The bearded fleors were covered with iron plates laid upon patent felt, to preserve the under side of the iron from rust and to deaden the sound. The rooms were separated from each other by brick walls and wrought-iron doors, and the stairs were all of stone. All the chimney fluor ways lived with cost iron and the brick walls and wrought-iron doors, and the stairs were all of stone. All the chimney flues were lined with cast iron, and there was not a piece of wood exposed in any part of the building. Many hundreds of tons of iron were used in its erection. These particulars have been extracted by the Times from its own account of the opening of the Pantechuicon, and they show that a belief prevailed forty years ago in iron as a protection against tire. This belief had been lamentably shaken, and it has probably perished in the ruin of the Pantechnicon. The danger of collecting a vast quantity of inflammable goods in a single building far outweighs the security derived from any precentions which skill or wealth can adopt in construction. At four different points an iron wall was built across the entire width of the building, from east to west, the theory being that in case of fire the communicating doors could be shut, the progress of the fire stopped, and the damage contined to a portion of the of the stopped, and the damage confined to a portion of the building. It is to be lamented that this theory has not held good in practice. These compartments were divided into warehouses, and these again into blocks or rooms, each of which had thick from and these again into Mocks or rooms, each of which may thick from walls and doors, and was, or was supposed to be, eatirely isolated; from the rest. The renters of these rooms had keys, and, as they and the proprietors of the building believed, their goods ran an little risk from fire as from theft. Except in the offices at the outrance, there was not a gaslight on the premises. The building was, as a rule, closed at dust, and the only lights allowed afterwards were safety-lamps. There were water-tanks and hose in the building but no hydrants. the building, but no hydrants.

Such was the Pantechnicon, and an opinion had come to he received that property was safe in it. We are told that some of the London bankers rented strong rooms there for the deposit of deeds and plate, although it is not easy to see why this building should and plate, although it is not easy to see why this building should be more safe than a properly constructed bank. Some goods were found to be on fire in one of the warehouses soon after four o'clock in the afterneon of Friday week. The firemen and workpooply got their masual engine, and tried to put out the fire; but the had difficulty in getting water, and produced no effect. The share was given, and within a quarter of an hour steam and manual engines and firemen were on the spot. The water supply at first was short, and it soon appeared that the Fantachnicos was doomed and Delgravia threatened. Happily the wast changed, and by four o'clock in this morning the fine was mach reduced and the danger was over. Only a position of the super wells was left standing, and "the whole place seemed to have mampled in." It is said that many of the depositors of goods had such fishis in the building as being fireproof as to cenit to insure their property. The belief in fireproof buildings will assecut, we think, survive this transendous example of its massandness. It may almost be said that nothing can save a large workhouse full of goods when fire has once taken hold of it, and certainly iron pillars and floors and stone staircases are the worst possible protection. Mr. Edwin Chadwick, writing in the Times, says that the opinion he collected among the firemen was that, with the head the fire had got when the engines arrived, they could not possibly have saved the building. Their services were limited to preventing the spread of the fire. If there had been a strong wind the existing means were insufficient to prevent a devastating conflagration. Fifteen minutes clapsed between the alarm and the arrival of the first effective engine. Mr. Chadwick suggests that for the adequate protection of property this interval ought to be reduced to five minutes; and he states that at the British Museum, by a proper arrangement of hydrants attached to mains under high pressure, water may be thrown on any part of the interior of the building in less than a minute and a half, while at the South Kensington Museum the time required is a little over two minutes. Mr. Chadwick complains that, through ignorance or inattention, a large building should be left unprotected and should expose surrounding property to destruction. But it or inattention, a large building should be left unprotected and should expose surrounding property to destruction. But it would be unjust to impute the loss of the Pantechnicon to these causes. It is evident that this building was thought to be a model of skill and care when it was constructed. In the course of forty years, however, the destructibility of stone and iron has been clearly demonstrated. The time has come to consider whether all large warehouses ought not to be required by law to take precautions against fire similar to those which have been adopted at the British Museum and the South Keusington Museum. "Large and tall and ill-protected warehouses" increase in number, and it is suggested that a fire in one of these in St. Paul's Churchyard might involve the destruction of the Cathedral. In Manchester, might involve the destruction of the Cathedral. In Manchester, where large and tall warehouses abound, water-supply is stated to be more efficient than in London, and yet the Irwell is a tiny brook compared to the Thames. Water from the river at Pimlico, although unwholesome to drink, would be useful to put out fires in Belgravia; and if Mr. Chadwick's system of hydrants be practicable, it ought to be adopted. The pressure on the mains at Manchester gives eighty feet jets from the hydrants, but for the taller buildings additional power is brought to bear by hand and steam engines. "The Police Stations are about half the distance apart that the Fire Bricade Stations are in Landon and from tance apart that the Fire Brigade Stations are in London, and from constant supply on the mains, and there being no sending for turncocks, it appears that the relief is brought to bear in less than onethird of the time at which it can be given in London." We see
the engines hurrying with prodigious clatter through the streets,
but we should prefer greater efficiency with less display if Mr.
Ohadwick can teach us how to obtain it. In any other country Obsdwick can teach us how to obtain it. In any other country such an establishment as the Pantechnicon would have been either managed or supervised by Government. But probably depositors would rather have trusted their property to Mr. Seth Smith and his descendants than to any public department. They seem to have believed in the immunity of his establishment alike from thieves and fire. It would have been an enterprise worthy of a master of the cracksman's art to lay burglarious hands upon the plate and jewels kept there, and would probably have excited as much astonishment as Colonel Blood's attempt to steal the Regalia from the Tower

The Pantschnicon will be rebuilt, and doubtless all will be done that can be done for the security of the new building. We may as well discard the word "fireproof," as it is likely to mislead. The well discard the word "fireproof," as it is likely to mislead. The only chance of safety lies in dividing the building vertically by brick walls, carried from the basement above the roof, so that if a fire occurs, it may be confined within one compartment, and in having pleaty of water and watchmen always ready to apply it. Mr. Chadwick is right in principle, and it is no disparagement to the Fire Brigade to say that they do not come into action as quickly as they would if nearer to the spot where the enemy appears. A fire in a warehouse must be put out in two or three minutes or it will become dangerous, and this rapid despatch can only be performed by firemen with hydrasts and hose upon the premises. According to the ideas of the time at which the Pantechnicon was erected, it was stated that not a piece of wood was exposed anywhere in the building. But it is acknowledged now that good stout timber is more trustworthy than iron for supports, because timber will stand till nearly burnt through, whereas iron will hend or yield under heat, and throw down that which rests upon it. The only safe material for building is substantial brickwork, and that is too expensive to be generally used. The site of the Pantechnicon is acanwenicnt as a depository for goods, and the accompanyto expensive to be generally used. The site of the Pantachm is servenient as a depository for goods, and the accompanymis meet, we suppose, he accepted by the neighbourhood. Yet
may be well to take advantage of an opportunity like that which
may Smith desired to obtain by burning a bishop to enforce
a tip public mind the acceptity for inspection and regulater large warshouses. The insoming Ministry may useaddress themselves to the humble and useful task of
alating for the protection of his and property from fire,
alating for the protection of his and property from fire,
alating for the protection of his and property from fire,
alating for the protection of his and property from fire,
alating for the protection of his and property from fire,
alating for the protection of his and property from fire,
alating for the results in hardly him dangerous to event a
utum of brick and iron, and fill it with fermitum and carriages.
Interest of the Times states that, Chicago has been republic

· (*)

without much additional precaution against fire, and this is exwhat we should have expected. Great blocks of satisfing and embraced under a single flat roof without any party walks carried up through them, and many roofs are of wood and amphalte or shingle. There is, however, plenty of water at Chicago, and the same Correspondent as people fluoding their flat roofs with water on an alarm of fire in the neighbourhood. Firick, says this writer, has proved itself comparatively fireproof. Pleasur has afforded, under trying circumstances, protection to materials which would otherwise have yielded. Wooden beams, under certain conditions, have proved more lasting than iron. Concrete floors have stood when stone calcined and over way. Iron count in pleasure when atone calcined and gave way. Iron caused in plaster has kept upright, when, unprotected, it bent and gave. There is unanimity among the professional writers in the Times in these conclusions. Builders may perhaps be induced to adopt them generally as far as is consistent with the aniversal domaid. them generally as far as is consistent with the aniversal domaind for cheapness, and in special cases like that of rebuilding the Pantechnicon it may be expected that a serious effort will be made to attain attructural accurity. But when all has been done that can be done we come back to this, that a fire in a large building must be put out quickly or it becomes unmanageable. Mr. Colo C.B. gives this as the result of his long experience as a keeptr of public buildings. "There is," he says, "no other security to be had than vigilant watching with means of instantly extinguishing a little fire as soon as possible after it arises." A hydrant ing a little fire as soon as possible after it arises." A hydrant with hose and a constant supply of water should be within easy reach. This at least Londoners might provide for their own protection, and although their water sometimes destroys life, it might be, if properly applied, an effectual means of saving property.

UNDOGNATIC BELIEF.

In the January number of the Contemporary Review appeared an article by Principal Tulloch, containing the substance of a lecture originally delivered at St. Andrew's University on "Dognatic Extremes." To this a reply was published some days later in the Pall Mall Guzette, and then a new spologist of the anti-dognatic theory took up the cudgels in the Fobruary Contemporary in the person of Mr. Hunt. Professor Tulloch's title does not strike us as very happily chosen, for his essay is throughout a protest not against extreme parties, as they are often called, in the Church, but against the principle of dognatic belief sltogether, which is common to all professing Christians, not to say Theists, except the little clique to which the writer himself belongs. It is not, however, with the title, but with the argument of the paper, and with the controversy it has evoked, that we are here concerned. Nor do we controversy it has evoked, that we are here concerned. Nor do we take up the discussion with any intention of entering on the irritating topic of the honesty or dishonesty of a particular school of clerical theologians, which the disputants on both sides have somewhat needlessly imported into it. The question itself, quite spart from its bearing on the position of religious parties or churches, or indeed on Christianity as such, is of sufficient interest and importance to justify some notice while the opposite pleadings of the Contemporary and the Pall Mall are still fresh in the minds of their readers.

Principal Tulloch starts with some general observations the tendency of the present ago to extremes of all kinds, political, scientific, and religious, and in illustration of his thesis he specially notes this tendency in the irreligious or atheistic he specially notes this tenuency in the kirchestone Arnold, the schools, as exemplified in writers like Mr. Matthew Arnold, the late Mr. J. S. Mill, and Strauss, to some of whose works he refers, as well as to the Life of George Grote. This "narrowness Into Mr. J. S. Mill, and Strains, to some of whose works he refers, as well as to the Life of George Grote. This "narrowness of vision," whother among believers or unbelievers, he regards as most deplorable and unjust. It is not only bud in itself and unfair to religion, but fixtal to human progress, for there must be progress in religious as in all other ideas. Greads and confessions of faith, of whatever date, are, he considers, valuable as landmarks of the state of knowledge and thought at the time when they were drawn up, and therefore claim our "reverence," but not our "subjection." No man's faith can be permanently bound by the forms either of the seventeenth century or of the fourth. "Men's thoughts about religion," which are embedded in creeds, inevitably thoughts about religion," which are embedded in creeds, inevitably change with the lapse of time, but it does not follow that they need abandon Christianity or Thoism. Here, however, it seems suddenly to occur to the writer that an awkward question may not unnaturally obtrude itself. "Is there not such a thing as true opinion in religion? Is Christian dogma incapable of verification? Is not the Church the depositary of divine truth ... and, if not, are we not cast on a sea of doubt, without any rest for mind or heart?" The answer is a little perplexing. On the one hand, Principal Tulloch admits, what indeed he could hardly help admitting, that "no Christian can well deny that there is such a thing as true opinion in religion, and that it is the duty of every one to try and find it." This truth "the Scriptures contain, and the Church gives voice to it." But then, unfortunately, her voice cannot always be trusted. The Westminster Confession declares—and here at least the nineteenth century, it seems, may safely follow the seventeesth—that all Synods or Councils since the Apostles' time may err, and many have erred. Nor is this the worst. Not only are all Churches fallible, but all creeds are, and from the nature of the case must be, false, quite as much as they not thus. This, we are assured in Italies, is "a feet," for "impersories or gastial error is of the very essence of Christian dogma," change with the lapse of time, but it does not follow that they need

and that fact of course "strikes, or ought to strike, at the very root of all Christian dogmatism"—why not say at once of all Christian dogma? In truth, in every Church those who cling most tenaciously to the dogma are just the men "who have least hold of the divine substance" which it faintly adumbrates. But here again recurs the old, and, as the writer seems uncomfortably conscious, still unanswered question, "Are we to halt between two opinions, or have only half opinions in religion?" And troublesome advocates of "the coarser forms of unbelieving dogmatism"—who are just as bad in one way as the "coarser orthodoxy of the Record" in another—will insist on pressing this question home. We do not wonder that Principal Tulloch writhes a little under the pertinacious cross-questioning of these "extreme dogmatists" of opposite schools, and is in no great hurry to bring out the answer which is at hat extorted from him. "True religious thought is always and necessarily indefinite. 'Haze,' if you choose to use the expression, is of its very nature." We can form no true idea of the Deity or of the future life; and as for popular Christianity, it is not even religious thought at all, but "a mere accretion of religious traditions," and "the whole function of thought is to purify and idealize inherited traditions." In short, to be an extreme dogmatist is to hold that any dogma—except the dogma of the fallibility of all Churches and Councils—can be more than half true at best, and to prefer definite bolief of any sort to "haze."

This certainly does strike one, as it seems to have struck the writer's This certainly does strike one, as itseems to have struck the writer's critic in the Pall Mall Gazette, as rather a strange profession of faith to be put forward by a high clerical dignitary who has subscribed that most intensely dogmatic, and by no means hazy, doctrinal compendium, the Westminster Confession. But with these personal aspects of the controversy, as we said before, we shall not meddle here. Principal Tulloch's theory of belief is fairly open to criticism, without any impeachment of his conscientiousopen to criticism, without any impeachment of his conscientiousness in maintaining it; and a very remarkable theory it is when it comes to be examined. It may be quite true that there is a tendency in various quarters, and quite as much among unbelieving as orthodox thinkers, to rush into extremes. Unbelief is often to the full as dogmatic as the most pronounced Ultramontanism. But that is hardly the point. What Principal Tulloch attacks is not really dogmatism but dogma, which is declared to be in its nature imperfect and variable; at its bost estate only "a faint adumbration" of a truth which the mind cannot grasp. No doubt any theist would allow, or rather affirm, the correctness of this statement, in so far as no finite intellect can comprehend the Infinite. But this does not prove that creeds may not be perfectly true as far as they so far as no finite intellect can comprehend the fininite. But this does not prove that creeds may not be perfectly true as far as they go, nor is the defect one which any "law of progress" has the slightest tendency to cure or to improve. In the year 3000 A.D., if the world lasts so long, men will be no better able than the friends of Job "to find out God"; and on the other hand it is difficult to see how the Apostles' Creed can have become more or less true in the nineteenth century than it was in the first. Let us take for instance its opening clause, to which, if to any, Dr. Tulloch's canon of essential haziness must apply, and which moreover asserts a dogma elevated far above the strife of contending parties in the Scotch or any other Church. Is it true or false? Strauss says plainly that it is false, which is perfectly intelligible. Dr. Newman plainly that it is false, which is perfectly intelligible. Dr. Newman on the other hand says somewhere that he never could conceive the idea of religion without dogma, for "there can as well be filial love without the fact of a father as devotion without the fact of a Supreme Heing," and to accept that fact is at once to accept a dogma of fundamental import, involving far-reaching consequences intellectual and practical. That is to say, in other words, the first article of the creed asserts a momentous truth, which is also quite intelligible. What is simply unintelligible to us is to say with Principal Tulloch that it is neither true nor falso, but partly both, inasmuch as partial error is of the essence of all dogma, and "haze" belongs to its nature. Of course if we are to understand that the notion of the error is of the essence of all dogma, and "haze" belongs to its nature. Of course if we are to understand that the notion of the Deity may be resolved into a "Kosmos," or "a stream of tendency," that again is clear enough, only the idea would be much better expressed in the "coarser forms" of Strauss and his English admirers, who tell us plainly that there is no God. It would occupy more space than we can afford, besides leading us into questions too solemn for discussion here, to apply Principal Tulloch's canon of criticism in detail to the later articles of the Gread. But it is obvious to remark that they assert facts of the Oreed. But it is obvious to remark that they assert facts of the highest interest and significance, if they be facts, or else they assert very audacious and misleading fictions; but in neither case is there any haziness about the statement. The miraculous and other events thus recorded either did or did not take place; there may be a conflict of evidence as to the truth of what is asserted, but there can be none as to its meaning. To believe or disbelieve it, or to give a verdict of not proven and suspend one's judgment, are intelligible states of mind; but to speak of its being partly true and partly false, but offering "a faint adumbration" of the truth, is, begging the essayist's pardon, to talk nonsense. If "it is a mere assertion of religious tradition," it is false; if it is "a divine verity," there is no sort of haze about it, and it is quite incapable of being "purified and idealized" by any progressive development of religious thought. We may add that the men who actually drew up and propagated these old creeds, at the risk of their own lives, were as far as possible from sharing this fastidious horror of "dogmatic extremes," and considering haziness a first candition of their orthodoxy. It is perhaps not too much to say that, if they had entertained the nebulous theory of Christian belief which finds favour with a select coterie of our modern Oreed. But it is obvious to remark that they assert facts of the

divines, Christianity would not have outlasted the century of its birth, and certainly would not have triumphed over the brute force of the vastest and most strongly compacted Empire the world has ever known.

Something of this kind was urged—for we do not profess to have been exactly following his argument—by the writer in the Pall Mall Gazette just now referred to. Dr. Tulloch has made no rejoinder, but Mr. Hunt, smarting apparently under a keen sense of proximus ardet, comes to the rescue, in the Contemporary of this month, to demolish what he calls the "savage" criticism of the Pall Mall Gazette. We cannot but think he would have been wiser to leave the matter in the congenial "haze" in which his abler confederate had enveloped it. He begins, as we have seen, by "abusing the plaintiff's attorney," and the greater part of his subsequent pleading is a pure paralogism, except the defence of the position of the Broad Church clergy, which comes to saying, ralent quantum, that their subscription to Creeds and Articles is only provisional, and that they have never concealed their opinion that "a restatement of the chief doctrines of Christianity is much to be desired." On which it is sufficient Something of this kind was urged-for we do not profess to concealed their opinion that "a restatement of the chief doctrines of Christianity is much to be desired." On which it is sufficient to observe that most of them have said nothing of the kind, and that Principal Tulloch's indictment holds good equally against any conceivable statement of doctrine, new or old. The main part of Mr. Hunt's argument, however, is based on what we must take leave to call a mere verbal quibble about the etymology of the word dogma. Every schoolboy knows well enough that its primary meaning is a decree, and that it only came secondarily to mean a doctrine because doctrines were ruled or defined by ecclesiastical authority. But to infer from this that Roman Catholics alone are consistent in adhering to any dogmatic belief is to start an entirely fresh and independent subject of discussion. In point alone are consistent in adhering to any dogmatic belief is to start an entirely fresh and independent subject of discussion. In point of fact, Protestants have held and do hold "dogmatic belief" just as much as Roman Catholics, to say nothing of a large section of Christians of whom Mr. Hunt has evidently never heard, as he takes Catholic and Protestant as an exhaustive division. We mean of course the Eastern Church, which yields to none in the rigid definiteness of its creed. Whether Protestants or Greeks have adequate evidence for the doctrines they profess may be an interesting subject for inquiry; but it has very little to do with the issue raised by Principal Tulloch. Roman Catholics ought to be grateful to Mr. Hunt for his assurance that they alone have any right to put faith in the creeds which for Protestants are simply "opinions without authority;" especially as he is kind enough to right to put faith in the creeds which for Protestants are simply "opinions without authority;" especially as he is kind enough to add that of all theories of revelation that of the Church of Rome is most like what we should beforehand have expected from the Divine Being, and that to establish such a Church "would have been much the best way" to secure a true faith among men. In ahort, he is so far from agreeing with Principal Tulloch as to the inherent impossibility of a dogmatic religion, that he thinks this would have been much the most natural form of Christianity, and best suited to the minds of men. But then, unhappily, there is "the clearest evidence" that "Catholicism is untenable," and so we must manage to do without it. This may or may not be so, but it is simply giving up the argument. However, Mr. Hunt doos essay to grapple with the writer in the Pall Mall Gazette on one point, though with very questionable success. He is extremely indignant at any one calling the articles of the Apostles' Creed "dogmas"; and argues, if we rightly understand him, that the facts asserted there may be believed, while the "dogmas made out of them" must be rejected as false; and he goes on to specify the dogmas of the there may be believed, while the "dogmas made out of them" must be rejected as false; and he goes on to specify the dogmas of the bodily resurrection of Christ and of the Trinity, which last, as now held, is declared to be an "absurdity." With the theological merits of this ingenious hypothesis we are not concerned here; but we must venture to observe that the alleged distinction between facts and dogmas in the Creed reminds us irresistibly of an analogy suggested in the Pall Mall. It sounds very like saying that the Claimant's account of the facts of his past life must indeed be accepted as true, but that "when we begin to make a dogma out of it" by asserting his identity with Sir Roger Tichborne, we are indulging in unauthorized and possibly absurd "speculations." The Reviewer's remaining point is that cortain objectionable dogmas, such as Calvinism, were once popular, but objectionable dogmas, such as Calvinism, were once popular, but have now gone out of fashiou, which at best only helps to prove what nobody drams of disputing—that false doctrines may pre-vail as well as true ones, but has no bearing either way on the principle of dogmatic belief.

We began with pointing out that the contention of Principal Tulloch concerns no mere quarrel between High Church and Broad Church, or even between Christianity and other forms of faith. It cuts at the root of all religious systems, for it miscalculates or ignores the religious element in human nature. We may test it philosophically or on the solviur ambulando method, and in either case with the same result. No religion professing to rest on divine revelation and aspiring to influence mankind can afford to hold its doctrines in solution, nor has any religion without a definite creed ever worked its way and left its mark on the world. What Professor Max Müller calls the three missionary religions of this day, Christianity, Mahometanism, and Buddhism, are all dogmatic, though their doctrines are widely different. Judaism, when it was a living faith, was fiscally digmatic. Protestantism in the heyday of its power, when it broke through the prescription of centuries and wrested half Europe from the allegiance of Rome, was passionately, almost faintically, dogmatic. It is very well for Mr. Kunt to say that in substituting private judgment for authority it saying the foundations of dogmatism, and that Professants are "Element" in regarding their creeds as

ing more than resords of opinion. At all events the lin-re did not think so, and when he has persuaded the great body phenomics to embrace his view, Prometantism, as a religion, to deal. To other the words of a writer whose "courser of unbellief" excites Principal Tullock's peculiar in-tion, but who seems to us here to be simply giving ness to an incontroversible truism:—"To be a Chrisutinines to an incontrovertible truism:—"To be a Uhristian in any real sense, you must start from a dogma of the most tremendous kind, and an undogmatic creed is as senselies as a statue without shape or a picture without colour. Unsectatish means unchristian . . . But accept that belief; think for a moment of all that it implies; and you must admit that your Christianity becomes dogmatic in the highest degree. Unsectarian Christianity can no more exist thus than can a triangle which is neither scalene nor isosceles nor equilateral." The same might be said, mustatis mutandis, of Islamism or Buddhism. There is a story told of an unfortunate Englishman who was hung at Constantinople, not for being a Christian—for Christianity was tolerated—but because his pious hatred of "dogmatic extremes" made it impossible to discover whether he was a Christian or not, and the law required every one to profess some definite religion. We are far from wishing to advocate so tranchant a mode of enforcing the necessary connexion between faith and form, but the Turkish Government showed a true instinct about the facts. All experience combines to testify against the stability and working women of "harm" and amendment and about the facts. All experience combines to testify against the stability and working power of "hasy" and amorphous creeds.

THE DAUPHIN AGAIN.

JULES FAVRE has been pleading a case in Paris which reads amazingly like a romance by the late Mr. James. The beginning of his speech sufficiently indicates the school in which he has been studying:—" Forty years ago, on the 26th of May, 1833, a stranger, still in the prime of manhood, but wasted by fatigue and suffering, without resources, and scarcely able to speak our language, entered Paris. He passed through the indifferent crowd, but an attentive observer might have discovered in his countenance traces of an indomitable firmness and a profound faith in the future." This stranger, according to M. Favre, was no other than Louis XVII., who had come to assert his title to be recognized as the Duke of Normandy and the heir of the Legitimate eognized as the Duke of Normandy and the heir of the Legitimate Monarchy. The narrative of the pretender's extraordinary adventures, while it certainly proves his indomitable resolution, scarcely justifies his faith in the future. He had to flee from one country to another, his life was constantly in danger, and the greater part of his time was spent in prison. He died miserably in Holland, having, it is said, been poisoned. He left two children; Adalbert Naundorff—Naundorff being the name under which the alleged Dauphin passed in private life—a lieutenant in the Dutch army, and a daughter; and these are now prosecuting their father's claim. There was a judicial decision against the elder Naundorff himself in 1836, and a decision against his heirs in 1851; and it is from the in 1836, and a decision against his heirs in 1851; and it is from the latter judgment that an appeal is now made.

Whatever the Court may think of it, it is certainly a marvellous story which M. Favre has set before it. There is of course nothing impossible or even improbable in the supposition that the Dauphin was rescued from the Temple. Indeed, nothing is more likely than that such a design was entertained, and that an attempt may have been made to carry it out; and there are many ways in which it might have been managed. It has been often asserted that the young prince did really escape, and more than one Louis XVII. has started up to assert his rights. Still the mere fact that a thing is possible or even probable does not show that it happened. In the present instance it is alleged that the Dauphin was thrown into a profound aleep by a dose of opium, and deposited in a secret place at the top of the tower. A lay figure was at first placed on his bed to lull suspicion, but afterwards a deaf and dumb child was smuggled into the Temple and passed off as the Dauphin. The next thing was to get the young prince out of the prison. It was thought that if the deaf and dumb child would only die, the prince might be put in the coffin instead of him, and so carried out. As the child showed no signs of dying, it was resolved to kill him, and an apothecary undertook to administer a sufficient dose of poison. A doctor, however, administered an antidote and the child was saved. Shortly after both the doctor and the apothecary died suddenly in a suspicious manner which pointed to poison. As the deaf and dumb many ways in which it might have been managed. It has been cious manner which pointed to poison. As the deaf and dumb boy persisted in living, a sick child from a hospital was substi-tuted for him. This child soon died, and the Dauphin took his place in the coffin, the series of substitutions being completed on the way to the cemetery by the Dauphin being taken out and the coffin being filled with paper and stones. The prince had been for eight or nine months in the roof of the tower, but whether he was in a swoon all that time does not exactly appear, for M. Pavre says he does not care for details. The removal of the Dauphin is said he does not care for details. The removal of the Dauphin is said to have been concerted by a number of persons friendly to the Royal family, including Josephine de Beauharnais, Barras, Hoche, Elohegra, and others; and it may be assumed that it could not have been carried out without the connivance of some of the officials. It strikes one that, if it was so easy to effect all these changes and substitutions, and to pass off first one child and then another as the Dauphin, it would have been possible to adopt the relative expedient of carrying him off first pretended burial at once.

Waves stated that after Josephine's matriage to Bonaparts

found to be filled with with the collin was taken up, and was found to be Moreover, in 1814, Josephine communicated has percord Russia, and so alarmed the Count of Prove perce of Russia, and so alarmed the Count of Provence Louis XVIII.) that he endeavoured to purchase her silence by offering her son an arrhal's biton and a province of France. It is also asserted that Louis XVIII. on his death-hed directed his Ministers to examine the papers in a certain chest which would show who was the rightful heir, and that after an examination of them they were disposed to proclaim the Duke of Normandy King, but were overruled by Cardinal de Latil.

The history of the alleged Dandinia advantages after his assesse.

Cardinal de Latil.

The history of the alleged Dauphin's adventures after his escape from prison is quite as wonderful as the manner of his abduetion. The luckless prince, M. Favre said, was betrayed and persecuted wherever he went. He was first taken to La Vendée, where his friends after a time abandoned him and took up another child instead. He fied to Rome, but was driven away by the persecutions of his enemies. On his way to London he was captured by a Fronch man-of-war and again cast into prison. Josephine procured his release; but immediately afterwards he was once more in prison at Straaburg, and Josephine had to repeat her kindness. He was then twenty-four years of age, had been hunted from one country to another, and had passed seventeen years in prison, so it was no wonder, M. Favre thought, that he should have forgotten the language of his childhood. He had picked up German from the wife of a Swiss clockmaker who had befriended him, and watchmaking from her husband. The name of Naundorff was adopted merely because it happened to be on a passport—he had none of his own—which was given him by some charitable person in order to enable him to enter Berlin. In 1815, when Louis XVIII. became King, Naundorff made himself known as the genuine heir to the throne, and in consequence got into when Louis XVIII. became King, Naundorff made himself known as the genuine heir to the throne, and in consequence got into trouble, and was repeatedly imprisoned. In 1833 he contrived to reach Paris, where he met and was recognised by Madame de Rambaud, the old governess of the Dauphin. He is also said to have been identified by M. de Joly, the last Minister of the Interior of Louis XVI. Madame de Rambaud was convinced by Naundorff remembering a child's frock which she showed him as one at a fifte at Varasillas, and which had afternoon whether remembering a child's frock which she showed him as one which he had worn at a fête at Versailles, and which had afterwards been discarded as too heavy. M. de Joly at first denounced the pretender as an impostor, but was converted when the latter reminded him that after the Royal family took shelter in the Assaubly, De Joly procured some food, and the King and Queen were rather doubtful about it lest it should have been poisoned, but the prince said, "Never mind, give me a spoon." Naundorff was not allowed to remain long in Paris. Undeterred by the condemnation of an impostor named Richemond to twolve years' seclusion for pretendto remain long in Faris. Undeterred by the condemnation of an impostor named Richemond to twelve years' seclusion for pretending to be Louis XVII., he commenced legal proceedings to compel the Bourbon family to acknowledge his rights; but a hint that the police were coming down on him frightened him off to England. The number of attempted assassinations which this wretched "victim of reasons of State" managed to survive, according to M. Favre's story, is certainly startling. At Strasburg his enemies, in order to obliterate his features, pricked and stabbed him in the face and rubbed corrosive acid into the wounds. At Prague he was stabbed in the street, and in London he was fired at when walking in his garden. His death in Holland is attributed to

M. Favre, who is not at all daunted by the marvellous character of the incidents upon which his case is founded, can conceive of no reason why Naundorff should not be acknowledged as the genuine Dauphin, except that it would cause a good deal of inconvenience in the Royal families of Europe—a very trifling matter in M. Favre's eyes. It must be admitted that the story on the other side is simpler and more coherent. The result of the judicial inquiry in 1836, as set forth in the official documents, may be briefly stated. It is asserted that Naundorff was born in Prussian Poland; and that in 1812 he was established as a watchmaker at Spandau. In 1822 he went to Brandenburg and was accused of fire-raising. He was equitted on this charge from wat of more fire-raising. acquitted on this charge from want of proof, but was soon afterwards sentenced to three years' imprisonment with hard labour for coining and circulating false money. After various wanderings he came to Paris in 1832, and endeavoured to make weak and enthucame to Paris in 1832, and endeavoured to make weak and enthusiastic minds accept the fable he had concoted. It is admitted that he enlisted a number of adherents, who were duped by the information he had collected about the Dauphin from published memoirs or private conversations with persons who had been in domestic service about the Court. The evidence of the Dauphin's death in the Temple is then examined. The report which was made on the subject to the Convention by a member of the Committee of General Safety states that, soon after the 9th Thermider, young Capet was placed under the care of a couple of keepers, Lasne and Gomain, both trustworthy men, who previously were acquainted with the personal appearance of their charge, and who could not be deceived by the substitution of another child. In order to render treachery on the part of the keepers impossible, the jealous Government of those substitution of another child. In order to render treachery on the part of the keepers impossible, the jealous Government of those days directed that they should be watched by a member of one of the Committees of the Sections of Paris, who should be changed daily. Lasne and Gomain never quitted the prince. Both were present at the moment of his death; he spoke to them an hour before he drew his last breath. He died on the 8th June, 1795, and must day the deputy Sévestre announced the fact to the Convention and deposited the producerous in the archive.

The judgment which was given in 1851 was to the arm of 1836; and a great deal of continuous.

de Beauchesse in a work which was published in 1852. These can be no doubt that Simon the shoesaker, under whose charge he was first placed, tseated the poor bey with savage brutality. He compelled the child to wait on him, to clean his shoes, to perform the most menial and humiliating offices. Every day there was a fresh struggle to get the prince to wear the rail cap; he was abused and besten, but in vain; until at length Simon's virage of a wife cut off the boy's long flaxen ringlets, and he folt so affronted and debased by his altered appearance that his spirit seemed to be broken. The day that the Queen was sent the Dauphin a gift of toys, including a miniature guillotine. He was subjected to an abuninable inquisition in order to make him repeat falsehoods about his mother and aunt. He was kept shut up in a falsehoods about his mother and aunt. He was kept shut up in a dark room, without any amusements, and with no company except Simon and his wife. Simon tried to teach him to drink and swear; and when he caught the child one day at his prayers, struck him in the face with his iron-heeked shoe and poured water over him. (oth Thermidor) he was found "eaten up with purulent sores."
He refused to eat or to speak, until in answer to one of his visitors, a benevolent-looking old man, he said, "I want to die." Barras saw the boy, and found him in a wrotched state of filth and disease. His knees had swollen to such an extent that his trousers were painfully tight. The treatment of the prisoner now became less rigorous. His new guardian, Laurent, was fond of him, and did what he could to restore his health and spirits; but his offorts were impeded by the Commissioners, who were changed every day, and bosides, it was too late. The poor boy was crushed and heart-broken. The district surgeon reported that "the little Capet had tumours in all his joints, and especially at his knees," and that to specially at the foliation of the specially at the knees, and that it was impossible to get a word from him. Lasne, Laurent's successor, was also a good-hearted man, and endeavoured to allowinte the captive's misery. Lasne came on the 29th of March, and the Dauphin died on the 8th of June. The account of his last moments is touching in the extreme. The boy was almost too weak to analy but he took (Jongie's hand in his own and kissed moments is touching in the extreme. The boy was almost too weak to speak, but he took (Jomain's hand in his own and kissed it, while Gomsin prayed. Gomain said he hoped he was not in pain now. "Yes," was the reply, "but not so much; the music is so fine," "Where do you hear music?" "Up there; listen, listen!" And after a moment, with a convulsive start, he added, "I hear my mother's voice among them." Then Lasne took his turn by the bedside, and the boy said he hoped his sister would hear the music too. Afterwards he said, "I have something to tell you." Lasne leaned down to listen. The prince was dead.

As far as probabilities go, it was of course extremely likely that

As far as probabilities go, it was of course extremely likely that the unhappy boy, after all he had gone through, should die from the combined effects of grief, ill-usage, and confinement. It is also much more probable that the pathetic evidence given by Lasne and Gomain is true than that they were capable of inventing it. But then there are a great many persons who do not think it worth while to believe anything that is not in the highest degree improbable, not to say impossible. Whatever the decision of the Court may be in the present case, the Duke of Normandy is tolerably certain to retain a staunch body of adherents.

THE SWISS ARMY.

THE Church and State conflict in Switzerland has become so warm that it has almost dimmed the controversy on army reorganization which has vexed the pleasant little Republic ever since the war of 1870-71. The effect produced among its citizens by German successes and French disasters was not only in no respect less than with us, but was intensified by the sight of Bourbaki's army driven helplessly like a huddled flock of sheep over the frontier by Mantoulfel, to be "interned" for the rest of the war, and by the fact that that part of the Swiss forces which was mobilized to guard the sacred soil of the Federation from outrage was found at every point to fall manifestly behind the requirements of the age for an army taking the field. This mobilization, our readers may be reminded, occurred twice. A large force was embudied at the outset of the war to watch the frontier near Basis, which it was apparently supposed that the South Germans might be tempted to violate, as the Allies did in 1814, for strategic purposes. This danger passed away, and the men under arms were dismissed to their homes. But twelve months later, as the plot about Belfort thickened, and rumours came of enormous concentrations of troops on either side to break

or hasty preparations was made to mustch the fortile apparations, the echoes of which resonated through the Jura; and it was to the Resoulican force them ordered to the frontier, commanded as in the previous summer by General Herney, that Olinchant (who succeeded to Bourbaki's ill-starred office) surrendered his fugitive legions almost under General Manuteufiel's eyes. All this brought war home in a manner to the Swiss, and their unpreparationes for it stood fully revealed to themselves as soon as General Herzog presented his Reports on the two mobilizations to the Federal Executive at Berne.

Federal Executive at Berne.

It is not our intention to follow those Reports here in detail. The Swiss of course were well aware before that they had no array, in the sense of a standing force in pay throughout the year. But they had a general belief that their militia would prove, thanks to the intelligence and patriotism of its elements, a tolerable substitute. They knew that they were supposed to have array divisions, a staff, autumn manceuvres, and a long list of officers of various arms understood to be educated for their special duties. And it was with all the annoyance of one rudely shaken out of various arm that the nation learnt from General Herzog's endiest Report, and the discussions which arose upon it, not only that a good deal must be done before the national force could cope with any standing army, but that it had proved itself in all its elements far below the moderate standard which it had been intended to mach when it was framed twenty years before under the then newly revised Constitution. Viewed as militia alone—and the pretence of any other name for it may here be dropped—it was found to be far less perfectly organized than even a militia force might, under thorough control, be made.

The theory of the Swiss military force was this. Following out the favourite national idea of a federation of Republics, it was to consist not of a homogeneous body, but of various contingents assigned to the different Cantons, and proportioned according to their respective means, not only as regards population, but the special circumstances which were supposed to fit the inhabitants for such or such particular arm. But it occurred at once to the framers of the Constitution of 1848 that it would be absurd to leave the technical parts of an army to mere municipal training and equipment. Consequently the Federal Government was charged from the first with the instruction and supervision of the cavalry, artillery, and engineers, and somewhat later with that of the rifle battalions, which may be looked upon as the crack corps of the service, and have often to be made up from two adjacent Cantons. The army staff was purely a Federal affair; but the infantry were left, under certain conditions, entirely to the Cantons, each of which up to the present time maintains its own petty war department, charged chiefly with the equipment and instruction of this arm. It follows that there are three distinct classes of officers in the Swies milltin. The Federal staff, which includes various civil departments, receive their commissions direct from the central authority at Berne, and such instruction as they have from its chief school at Thun. The officers of the special arms are all appointed by the Cantons, but are put through their original and practice trainings under Federal inspectors and in the Federal schools—or classes, as they may be more properly termed—established at Thun or elsewhere. The infantry are raised, taught, and exercised entirely by the Cantons under drill instructors of their own, and their officers have nothing to do with the Federal authority at all, save when called out for autumn exercises, an event not occurring on an average to each of the nine divisions maintained on paper more than once in soven or

Now, as the twenty yours that followed the struggle of the Sondorbund were tranquil as concerned Switzerland, it is not surprising that there event into the working of the military machine a laxity which increased as time went on and the occasion for the use of the force was still deferred. The Swiss militial never indeed sank down to that mere paper existence which became the normal state of things in America before the great Civil War. But the period of recruit drill was shortened. The annual training prescribed sank in the infantry to one every two or even three years, under the constant pressure put on the Cantonal supervision curtailed their exercises, partly no doubt under the influence of the example of their infantry comrades, and partly because it was felt that there would be a difficulty in finding effectives for their ranks if their training was mulatained at the original standard. Herr Steempfli had long before pointed out, to the surprise of his countrymen, that the popular tradition that "every Swiss is liable to bear arms" had been altogether departed from in the case of nearly half the population. And it fell to General Herzog to astonish them still more after the summer mobilization of 1870, when, in the cool analysis of a professional Report—clear, incisive, but not overdrawn—he showed that the special contingents borne on the muster-roll were lacking in all the essentials for war, that the paper departments which existed in the War Office at Berne were either unreal or unpractical, and that the infantry battalions farmished to his force by the Cantons were some of them in such a condition as, to use his own phrase, "must make the heart of any patriot and."

Then came a short paradise of army references. Quicker even than our own press two years since, the busy press of the Republic threw out letters, easy, and heatily-written octavos. The military question became the leading one of the day. And, as the time coincided with the end of the twenty years for which aimse the old military Act was to sun, there was every legal reason in favour of those who pressed for some considerable modification of its provisions. Of course there was a large party of resistance to reform; there were men either parally conservatives by nature, or democratic haters of "militarism," or prinsually interested in opposing the extension of personal service and taxation which was demanded. They were little heard of for the time, however, and have only very recently found their voice in the press. But it was a weighty element in their favour that no great press. But it was a weighty element in their favour that no great military change could be introduced without the revision of the existing Constitution; and when this came in question there were same to be other large elements opposed to change, especially the French Badical section of the South-West, which feared the centralisation that would be inguited to the power of the dominant Garman. Radical section of the South-West, which feared the centraliza-tion that would bring it more into the power of the dominant German speaking population, and the Ultramontane party, which hoped to control as of old certain individual Cantons, and could only lose by the merging of local powers in the hands of a Federal Govern-ment of strong Protestant sympathies. These factions, indeed, united with the more commonplace haters of change, managed to throw out the revised Constitution when it was put to the plebis-cits last May and so have given the army reference another was

cite last May, and so have given the army reformers another year in which to adjust their diffurences among themselves.

The more ardent of these, in the first heat of enthusiasm, had advocated extreme measures. They would have enrolled every man capable of doing any service, distributed the country into regular districts with a permanent staff, extended considerably the register of instruction regular districts with a permanent staff, extended considerably the periods of instruction, registered all the horses for such service as they might be useful for, and called out each division or army corps at least once in two years, so as to work the whole of its departments, which were of course to be efficiently completed. But to such large schemes there will always be this objection in Switzerland, independently of the considerable expense they threaten, that they never can be carried far enough to enable the little Rosenblic to come with the great Empires which border little Republic to cope with the great Empires which border it. Switzerland has not in fact the size or the population requisite to enable her to enter on the general European theatro with any decisive force. Her efforts, if attacked, would almost necessarily be confined to making as good a defence as possible until succour came from without. This truth has probably until succour came from without. This truth has probably been felt, though not distinctly uttered, by the more moderate military reformers. These are represented nearly by the present Federal Executive, which succeeded last year, as again in the recent Session, in obtaining a majority in both Houses in favour of its scheme. That scheme may be defined briefly as completing the law of 1850 by making the training of the special arms slightly better, completing the necessary civil departments (which contents the meant chiraly on paper) and bringing the infanty under slightly better, completing the necessary civil departments (which exist at present chiefly on paper), and bringing the infantry under the effective control of the Ierne War Office. With some slight modifications in favour of the privileges of the Cantons (which are found very obstinate in retaining their local War Departments) it seems probable that this measure of reform will be adopted. If it be fairly carried out, Switzerland will possess a militia as efficient as any such citizen-soldier force can be made in a free country not absolutely threatened by war; but the vision entertained by some onthusiastic advocates of the system, that it can vie with that of standing armies is one that is most unlikely to be realized, and it standing armies, is one that is most unlikely to be realized, and it is to be hoped that practical proof may be spared it. The most prominent defect will remain as now, that the army staff are not merely untrained for their special duties, as was not long since the case with ourselves, but that they are in fact little better than civilians bearing military titles; for the classes of instruction they attend are no more than sufficient, by the confession of Colonel Weltli himself, who has had the charge of the new law, to enable them to find out what they ought to study. To say that they can know nothing personally of the divisions to which they are attached for maneuvres or mobilization would come ill as a are attached for manouvres or mobilization would come ill as a reproach from us, who persist, with all the means at hand for correcting it, in voluntarily maintaining this element of confusion and weakness in our own organization. And one useful lesson at least we might learn from the Swiss militia, namely, a wholesome jealousy of degrading the higher military titles. Colonels and majors are indeed almost as cheap in that country as our Auxiliary Force commissions and honorary rank have made them here. But the commission of general, so wantonly scattered among ourselves as to become meaningless, is reserved in Switzerland for him who actually takes command in the field; and the title which he retains when his acruice is done forms a patent higher than that of nobility when his service is done forms a patent higher than that of nobility in his fellow-countrymen's eyes, and is of itself a sufficient reward.

in his fellow-countrymen's eyes, and is of itself a sufficient reward.

Whilst all things tend among the Swiss to as practical a solution of the military question as their means allow, there are not wanting those who would give up even such organization as they possess, in blind faith that patriotism and intelligence would supply its place against French or Prussian army corps as easily as against Charles the Bold's legions of men-at-arms in the middle no against Unaries the Dold's regions of men-at-arms in the middle ages. Herr Stasmpdi at the very beginning of the agitation found is necessary to explain seriously to some of his follow-citizens that the days for defending a country with helberd and pike are gone by. But national fancies are bard to hill. And not only has the stuff on which this patriotic delusion feeds been of late scattered through the Swine press, but Herr von Eriach, one of the extremists in the direction indicated, has rushed into print in Germany with an octave volume, written apparently to let all the world know how

definealess the Republic would be if the anti-refirmers get their own way. To do away absolutely with the present organization, to rely entirely on parch militia efficaced by the manicipality, to let every men carry just what weapon he chooses, and, for the result to put faith in such " sublime" efforts as those of the Poins in 1853, or the Parisians in 1871—such are the teachings scattured through two hundred pages by the author of Wiederschurd des Lidgenossisches Wiederschus. As a author of Wiederschurch his effusion is well worth reading; and, as the Swins can hardly desire to undergo the fate of Poland or Paris, the author's proposals to his countrymen probably enery their own antidots with them in the illustrations which he offers.

TRE WHITE PILORIM.

THE WHITE PILGRIM.

THE programme of the Court Theatre might be succinctly stated as "Births, Deaths, and Marriages." We really do not know, nor we believe does anybody else, what the first piece is about, but we do know that Mr. W. J. Hill is very funny over his twin children. The second piece is that harrowing composition, the White Pilgrim, and the third is the jully rollicking Wedding March. We do not know exactly with what object the second piece of the evening was written, but if it were intended to make the third go well, the authors have certainly succeeded. The most tragic of tragedies could hardly be expected to find a home at the Court Theatre, and to be played on the same night with home at the Court Theatre, and to be played on the same night with the longest and most uproarious farce. Yet we must allow that a bold attempt has been made with considerable suscess. The blank verse of the White Lilgrim is good, and deserves to be more blank verse of the White Pilgrim is good, and deserves to be more uniformly well delivered, and the stage accessories, such as thunder, lightning, darkness, and the apparition of Death, are used effectionly to deepen the gloom and horror of the story. Mr. George Hignold looks and acts the character of Harold well, and Mr. Vezin does the best that can be done with the singularly hopeless character of Sigurd. It may be feared that the public will not be greatly attracted by the goodness of the blank verse, and therefore we feel called upon to say that this is the best ghost story that has been produced lately upon any stage. It would perhaps be more effective in a larger house, and certainly the minor parts might be more strongly east. Still, it is worth seeing, if only for the contrast it affords to everything else that is now being played in London. in London.

The character which bears the name of Harold has drawn by various hands. Scott wrote a poem called *Harold the Dauntless*, and somebody else wrote a poem with a Harold, or some such character in it, which was pronounced by the critics to be much more like Scott's style than was Scott's own work. We do not suggest that the authors of this play have horrowed from Scott. because almost anylody could write as good borrowed from Scott, because almost anybody could write as good lines as Scott wrote in his careless moods:---

Young Harold was feared for his hardlhood, His strength of frame, and his fury of most !

Harold's father had become in some very limited sense of the word Christian, but whether the Bishop converted him or he the Bishop is perhaps doubtful. What is certain is, that they dined together, and both wine and talk flowed freely. Meanwhile, Harold had quarrelled with his father on the religious question, and loft the castle, followed by a faithful page, whom he thus addressed:—

Can'st thou, as my follower chould, Wade ankle-deep through foeman's blood, Dare mortal and immertal foe, The gods above, the fiends below, And man on earth more bateful still, The very fountain-head of ill?

Harold, in performance of an after-dinner vow, visits the castle of the Sevon Shields, where he sees a spectre, and receives a warning to repent of his evil life. He remembers this warning at the moment when he is about to slay a fee, and spaces him, and then he learns that the spectrs was his father, now deceased, who is doomed to wander on earth until his son should turn to grace. Harold also has a dream, in which he sees three knights who lead a black horse, and invite him to mount upon it:—

and invite him to mount upon it:—
The first proclaimed, in sounds of fear,
"Harold the Dauntless, welcome here!"
The next cried, "Jubilee! we've won
"Count Witikind, the Waster's son!"
And the third rider sternly spoke,
"Mount in the name of Zornesbock!"
From us, O Harold, were the powers,
Tay strongth, they dauntle sness are ours;
Nor think, a vassal thou of Hell,
With Hell to strive. MA MEN OUTS I

Harold accepts this warning and repents, and after a hand-to-hand fight with the god Odin, who tries to carry off his page, and whom he puts to rout, he discovers that the rescued page is a young lady who is in love with him, and he is christened and married on the same day.

ans poem is interesting as an example how very hadly Scott could write, and also as containing a Harold something like the Harold of the White Pilgrim. Scott, however, gave us plenty of horrors in the story, but allowed a happy ending, which he introduced by observing that a young man had much better marry and settle instead of going about the world drinking, swearing, and braining people with his club:—

Oh, dull of heart, through wild and wave, In search of blood and death to rave, With such a partner nigh!

The morality is here better than the poetry. The modern authors, however, allow their Harold short time on earth for repentance, and none for amended life. They have preserved inflaxible austerity, and much praise is due to the actors and some to the audience that such a plantage of the audience that such to the audience that such a play passed safely through the ordeal of a first night. The conflict between Christianity and Paganism is well exhibited in the love of Harold for Thordisa, and the contrast in the opening scene between the song from the banquet hall trast in the opening scene between the song from the banquet hall and the psalm from the chapel is cleverly imagined. It is indeed a sort of prologue to the play, in which Harold fluctuates under the contending influences of good and evil. The leading idea of the play is manifestly the same as that of Scott's poem, but we are bound to say that a passage which has been quoted from the play in the Times is better written than any passage of similar length that can be found in the poem. Blank verse has at least this advantage, that you need not resort to despicable shifts for rhyme: rhyme:-

Earl Olaf swore the oath in fearful words; And as the mighty rafters rang again, In ominous sound of ominous laughter back, He called on Death to register the vow.

Harold is persuaded by Sigurd and his riotous companions to repeat the oath of his ancestor, Earl Olaf. He swears that should a Norman cross his threshold he will kill him within a month, a Norman cross his threshold he will kill him within a month, and calls on the powers of heaven or hell to take him if he breaks his oath. The White Pilgrim is Death, who appears, dim and shadowy, in answer to this invocation. A thought more awful than any that this tragedy inspires is that it is certain to be burlesqued. The love-making here is at the beginning, whereas Scott placed it at the end. Harold and Thordisa come to an understanding. The lady gives him a cross and chain, and he might have been christened and married out of hand, but she goes on a state to present the silvents. have been christened and married out of hand, but she goes on a most unseasonable pilgrimage. It is abundantly clear that if he had married her she would have turned his bachelor friends out of the castle, and therefore Sigurd has an intelligible reason for counteracting Thordisa's influence. No sooner is she gone than he takes the impious oath, and the next moment a Norman Count and his wife seek shelter in the castle. Many men less bold and blasphemous than Harold are capable of doing what Harold did, which was to flirt with a married lady, while his own future wife was gone upon her pilgrimage. But Harold has his oath weighing upon his soul, and affirts as he drinks to distract thought, and also because he likes it. The lady is warned of the danger to her husband's life, and he flirts as he drinks to distract thought, and also because he likes it. The lady is warned of the danger to her husband's life, and on the last day of the month she exerts herself to fascinate and detain Harold, so that he may have no opportunity to kill the Count. Thordisa returns and learns the unhappy state of things, and in despair at her lover's infidelity she forgets her Christian hopes and duties, and desires that she may die. The White Pilgrim appears again, and tells her that her prayer is granted, and that in the grave she shall find the peace which is denied on earth. The speech of Death and other speeches of the play touch with much power and pathos topics not often handled on the stage. Harold tells Sigurd that he has destroyed his happiness here and hereafter, and that when they meet in the place of lost souls they will be strangers. Another speech of Harold slightly savours of Othello's final words, and throughout the play there are reproductions of thoughts appropriate to the circumstances which have ductions of thoughts appropriate to the circumstances which have naturally occurred to other poets handling the same themes before. naturally occurred to other poets handling the same themes before. The truth is that this is a very well-written poem; but its merits are rather dimmed by the inadequate delivery of some of the best passages. The actor who has to tell the story of Earl Olafs oath appears the same evening as the embarrassed husband in the Wedding March. How can any man, except of rare genius, do things so very different equally well, and how can we expect to find a rare genius making himself generally useful at a small theatre? The lines spoken by the White Pilgrim would become the mouth of the best elocutionist of any age:—

Miscall me not! My generous fulness lends Home to the homeless, to the friendless friends; To the starved babe, the mother's tender breast, Wealth to the poor, and to the restless rest.

We all remember the text on which this commentary hangs, and an effective speaker of these lines must command the sympathy of every person in the theatre. The talent for appearing and disappearing in ghostly fashion is different from that of delivering blank yerse, and some good actors and appearing have been appeared. appearing in ghostly fashion is different from that of delivering blank verse, and some good actors and speakers have made very awkward ghosts in *Hamlet*. If it could have been expected that this play would succeed the manager might perhaps have made more perfect arrangements for its production. That the attempt was made, and that it has partially succeeded, is a remarkable and encouraging feature in the dramatic history of our time. The play does not end as well as it began. It is difficult for a pair of lovers to die gracefully on the floor, and the spectators are probably aware that it will be necessary to clear away the dead bodies, and make way for the wedding rout. But it may at least be said that, in order to enjoy the third piece at the Court Theatre, one ought to see the second.

REVIEWS.

NEWMAN'S HISTORICAL SKETCHES.

NEWMAN'S HISTORICAL SKETCHES.*

THIS last published volume of Dr. Newman's Historical Statebase is not less graceful and interesting than that which we reviewed a year ago, though it is perhaps, to Protestants at least, less entirely agreeable reading. For it is to some extent controversial, and brings us upon topics where, although we can disting as heartily as ever his literary skill and his sympathetic ineight into character, we are nevertheless obliged to interrupt the pleasure of following his train of thought by stopping to note what seem to us the unsound parts of his arguments, and the questionable assumptions upon which those arguments are based. It consists of a series of sketches of the lives and work of several early Saints and Fathers of the Church, beginning with St. Basil and ending with St. Benedict of Nursia, and including Basil himself, St. Gregory of Nazianzus, St. Anthony, St. Augustine, St. Martin of Tours, St. John Chrysostom, and Theodoret. Of one or two of these great men, and in particular of Theodoret, something like a full biography is given; of others we have only brief notices, dwelling on some particular point of their respective careers, or taking them as representatives of some feature of their times, or some tendency or characteristic of the Catholic Church. Thus monastic asceticiam is described and vindicated in the person of Anthony, and the characteristic of the Catholic Church. Thus monastic ascetteram is described and vindicated in the person of Anthony, and the monastic life of the West, its aim, its organization, and its practical results on the world, are elucidated in an essay on the labours of St. Benedict. For historical purposes, the value of these sheethed would have been increased if the general history of the times had been more fully described instead of being morely assumed as would have been increased if the general history of the times had been more fully described instead of being merely assumed as known. But Dr. Newman does not appear to be here writing primarily for historical students. His aim is partly that of a theologian illustrating certain religious or moral truths by the example of these men; partly that of an acute observer of human nature who is interested in character as character, and enjoys the study of men's acts and words for the sake of the general psychological lessons that may be drawn from them; partly that of a polemical advocate of modern Roman Cathories and practice, who desires to vindicate the latter as doctrine and practice, who desires to vindicate the latter as grounded on primitive usage, and sanctioned by the lives of persons whom Christians of all subsequent ages have agreed in persons whom Christians of all subsequent ages have agreed in venerating. His method of doing so is, for literary and dramatic purposes, by far the best—that of making extracts from the writings and especially from the correspondence of these early Saints, in which they depict their own feelings and motives, trace in their own words the development of their characters, and exhibit, consciously or unconsciously, the view they took of the conditions and questions of their time. Working these extracts into his own narrative of the lives of Gregory, Chrysostom, and Theodoret, he gives us a refined and sympathetic delineation of their hearts and minds, and brings them near to us in a way which the regular historian scarcely attempts and seldom succeeds in. To be sure, there are some defects in such a process either from an historian or a purely biographical point of view. It does not present to us the whole of the man, either by himself or as a factor in the great events of his time, but sets forth rather an aspect of the man events of his time, but sets forth rather an aspect of the which is true so far as it goes, but is not necessarily the entire truth, and which may leave us far enough from being in a position to pass a fair judgment upon his place and work. For when we ask pass a fair judgment upon his place and work. For when we ask what are the shadows, the defects, in an otherwise admirable character, the question does not always spring from the base desire to drag all mankind down to a common level, but sometimes from the feeling that humanity is in a certain souse dignified by its weak-nesses, and that a more cheerful view may be taken of it when it is seen what are the frailties associated with even the highest virtues. We ask also, How did the man in whose writings we virtues. We ask also, flow did the man in whose writings we discover these noble aspirations, this tenderness, this delicacy of sentiment, actually comport himself in life? Did he act up to his ideas? Did people round him feel what was in him and recognize the loftiness of his aims? Was he a saint to them in his acts as he has been to posterity in his words? Not that Dr. Newman seeks to conceal the defects of his heroes, or that he does not feel seeks to conceal the defects of his heroes, or that he does not feel how needful a picture of their outer as well as their inner life is. He desires to give some impression of it; in some instances he actually does give it, and in the case of Theodoret, for example, presents us with a most interesting study of the contrast between his actual duties as a bishop and those for which nature had fitted him, and which he would probably have discharged with more fame and success. Nor do we complain of Dr. Newman's taking the most favourable view of those whom he describes, for he is a biographer, and they are Saints—a word which necessarily he is a biographer, and they are Saints—a word which necessarily means more to him than to us. Those whom the deliberate judgment of the Church has canonized or heatified he feels himself ment of the Church has canonized or beatified he feels himself scarcely entitled to criticize freely from a purely human point of view. Our objection, if it can be called an objection, is rather to this form of biography, which aims rather at giving an aspect of the man in particular crises of his life, and in the light of particular theories, than a simple account of him, and which touches too alightly on the general history of the time to enable us to form a clear conception of his place in it and his results on it. The method and the manner in which it is a pulled in the book are fall of charm and of infinite but it is a printer father of a directional and

Historia Branch Branch Barrier Branch Barrier Branch Barrier Branch Bran

psychological then of an historical kind; and for the purposes of history it needs both additions and corrections.

We are half unwilling to make this criticisms, because it may seem to detract from the worth of an effort which, as it is important everywhere, is nowhere more important then in the case of the great writers and politicisms of the early Church—the effort to give a moving and heathing life to persons who have become more names to nearly all readers of history. These ancient Fathers are to most of the Roman Catholics and Anglicans who still study them—few enough now—little more than impersonations of dry and abstract virtues; while by the educated modern world at large they are almost forgotten; they have at any rate fallen altogether and abstract virtues; while by the educated modern world at large they are almost forgotten; they have at any rate fallen altogether dead, as Mr. Carlyle would say; they have become uninteresting, because incomprehensible. With the popular dislike to them as men who are supposed to have given Christianity a dogmatic turn, Dr. Newman has of course no sympathy, and he holds it in so much contempt that he does not care to oppose it; what he seeks is rather to protest—which he does with all the ardour of a poetical temperament, and in what Mr. Matthew Arnold would call the truly literary spirit—against the tendency among those of his own faith to make the Fathers so much Saints that they cases to be men: they cease to be men :-

those of his own faith to make the Fathers so much Saints that they cease to be men:—

What I want to trace and study is the real, hidden, but human life in the "interior," as it is called, of such glorious creations of God, and this I gain with difficulty from mere biographies. Those biographies are most valuable, both as being true and as being entiting; they are true to the letter as far as they record facts and acts; I know it; but facts are not enough for sanctity; we must have saintly motives, and as to these motives, the actions themselves acidom carry the motives along with them. In consequence, they are often supplied simply by the biographer out of his own head, and with good reason supplied from the certainty which he feels that since it is the act of a saint which he is describing, therefore it must be a saintly act. Properly and naturally supplied, I grant; but I can do that as well as he, and ought to do it for myself, and shall be sure to do it if I make the Saint my meditation. The biographer in that case is no longer a mere witness and reporter, he has become a commentator. He gives me no insight into the Saint's interior, he does but tell mo to infer that the Saint acted in some transcendent way from the reason of the case, or to hold it as faith because he has been canonized. For instance, when I read in such a life, "The Saint when asked a question was silent from humility," or, "from compassion for the ignorance of the speaker," or "in order to give him a gentle rebuke,"—I find a motive assigned, whichever of the three is selected, which is the biographer's own, and perhaps has two chances to one against its being the right one. We read of an occasion on which St. Athanasius said nothing, but smiled when a question was put to him; it was another Saint who asked the question, and who has recorded the smile; but he does not more than doubtfully explain it. Many a biographer would simply out of piety have pronounced the reason of that smile. I should not blame him for doing so; but it was more

The view of a Saint here presented is one which most Protestants will find unfamiliar, and perhaps hard to enter into; nor will anything in the book be more interesting to an open-minded Protestant than the impression it gives him of Dr. Newman's view of a Saint, and what is called "devotion" to him, the sort of veneration with which he is to be regarded, the sort of influence which his words and example are to exercise. In the following extract the same train of thought is pursued :-

extract the same train of thought is pursued:—

I do not think lightly of the debt of gratitude which we owe to their biographers. It is not their fault if their saint has been silent; all that we know about him, be it much, be it little, we owe to them. Some of those Saints who have written meet have told us least. There was St. Thomas; he was called in his youth Bos Siculus for his silence; it is one of the few personal traits which we have of him, and for that very reason, though it does but record the privation of which I am complaining, it is worth a good deal. It is a great consolation to know that he was the Bos Siculus; it makes as feel a sympathy with him, and leads us to trust that perhaps he will feel some sympathy for us, who for one reason or other are silent at times when we should like to be speaking. But it is the sole consolation for that forlions silences of his, since, although at length he broke it, to some purpose as regards theology and became a marvel (according to the provert in such cases), still he is as silent as before in regard to himself. The Angel of the Schools! how overflowing he must have been, I say to myself, in all bright supernatural visions and beautiful and sublime thoughts! how series in his contemplation of them; how winning in his communication! but he has not helped me ever so little in apprehending what I firmly believe about him....
Biographers have done what they could. It would not have improved matters if they had been silent as well as the fight; still they cannot make up for their Saint's silence; they do not deprive me of my grievance that at present I do not really know those to whom I am devout, whom I hope to see in heaven. A Saint's writings are to me his real life; and what is called his "Life" is not the outline of an individual, but either of the automist or of a myth. ist or of a myth.

The most complete and psychologically satisfactory sketch is that of Theodoret; the most philosophical, and also to a general reader the most interesting, are those entitled "The Mission of St. Benedict," and the "Benedictine Schools." In these two of St. Benedict," and the "Henedictine Schools." In these two articles Dr. Newman, taking St. Benedict as par excellence the organizer, if not the founder, of the monastic system, and his Order as the largest and most widely influential, gives us a theory, as it may be called, of the most and his life in the earlier middle ages, showing how it aimed first of all and directly at quiet, peace, seclusion from worldly temptations, freedom from worldly entanglements, and how out of this grow naturally and necessarily other occupations not raisly the constant with this main object, though not containplated by these wheatter sought it—the labours of agriculture, the duties of landsweath, the copying and then the

editing and compiling of literary works, the education of the young. More recent monasticism has developed itself in lines that are really different; and Dr. Newman takes as types of these Heminic and his Order, to whom he assigns the Scientific element, and Ignatius and his Order, to whom he assigns the Practical St. Benedict and the great and many-branched Benedictino Order represents to him the Pretical—that is to say, the temper of mind which is the original and most truly and purely monastic; the temper which listens, believes, reverse, wonders, meditates, loves, but does not attempt either to analyse or investigate logically on the one hand, or to govern and influence the world on the other; the temper of children, the temper of simplicity and faith, alien from any sustained intellectual effort, be it either speculative, or practical:—

practical:—

The monastic state is the most poetical of religious disciplines. It was a return to that primitive age of the world of which poets have so often sung, the simple life of Arcadis or the reign of Saturn, when fraud and violence were unknown. It was a bringing back of those roal, not fabbulous, scans of innocence and miracle when Adam delved, or Abel kept sheep, or Noe planted the vine, and angels visited them. It was a fulfilment in the letter of the glowing imagery of prophets about the evangelical period. Nature for art, the wide earth and the majestic heavens for the crowded city, the subdued and decile beasts of the field for the wild passions and rivalries of social life, tranquility for ambition and eart, divine meditation for the exploits of the intellect, the Croator for the creature—such was the normal condition of the monk. . . Postry I concive, whatever be its metaphysical essence, or however various may be its kinds, whether it more properly belongs to action or to suffering—nay, whether it is more at home with society or with nature, whether is always the antagonist to Science. As somence makes progress in any subject-matter, poetry recedes from it. The two cannot stand together; they of each other. . . . The mission of science is to destroy ignorance, doubt, summes, suspense, illusions, fears, decrets, secording to the "Pails" qui potuit rerum cognoscere causes" of the poet, whose whole passage, by the way, may be taken as drawing out the contrast between the poetical and the scientific. But as to the poetical, very different is the frame of mind which is me essany for its perception. It demands as its primary condition that we should not put ourselves above the objects in which it resides, but at their feet; that we should feel them to be above and beyond ma, that we should look up to them, and that, intend of fannying that we cannot mean which they premi admit of many explanations, and we cannot mean which they premi admit of many explanations, in the primary down the notes of the Be

We have not space to follow Dr. Newman in working out this theory of the Benedictine life, and showing how the circumstances of Western Europe and the tendency to devolop in new forms, natural to a great institution, led the Order into different kinds of sctivity from those simple ones of prayer and manual toil which its founder had contemplated. Although he deals here with a well-worn thome, his manner of illustrating by instances fills it with freshness and interest, and he succeeds, we think, in showing that the classical learning of the monks, even in those darkest days which he between the beginning of the seventh and the end of the eleventh century, was more considerable than most historians, and among them Mr. Hallam and Dean Milman, have been disposed to Nor was their literary ability always so contemptible. Their prose had, to be sure, nothing classical in its structure, though they used to hint out classical phrases with anusing care, and their verse was hopelessly rough and uncouth. But the matter was often weighty, and even their lumbering hexameters (as in the case of Theodali of Orleans and Florus the Deacon) sometimes display genuine method retween times display genuine poetical power.

Nor are we disposed, after having drawn so much pleasure from Dr. Newman's book, to enter on the ungracious task of controverting the arguments, or rather the suggested inferences, in favour of his own creed which he scattered through it, albeit the arowal in his preface that his purpose is to some extent polenical might well warrant one in so doing. It is enough to remark that he proceeds throughout on the assumption, so constant in Roman Catholic writers, that because the outward appearance of historical continuity with the Church of the middle ages has been preserved by the Roman Catholic branch of the Christian community, therefore that branch in its modern form is the only true representative, not only of the Church of St. Francis and St. Thomas, but also of the Church of Alcuin and Charlemagne, of the Church of St. Bead, St. Augustine, St. Benedict, that Protestants have no share in the glories or virtues of those ancient Saluta, are no beins of their the glories or virtues of those ancient Saints, are no heirs of their spirit, are practically condemned by their example. The fact is that since the cenvulsion of the sixteenth century no section of the Church has been entitled to claim the sole heirship of the Church of the first ages, but some of its tendencies find themselves more fully represented in one place or sect, some in another. Modern larsel would be quite as well entitled to assert an exclusive right to Moses and the authors of those Psalms which are the basis of Christian worship as are Roman Catholics to the early Fathers. Again, as respects the argument from primitive practice in favour of certain forms of asceticism, and in particular of a monaster life, it is not necessary for Protestants to deny that they were then useful and that there is still much to admire in their spirit. In modern society it may be otherwise, and, so far from being useful, they may possibly produce greater evils than they were originally intended to most. And, as a Pope suppressed that Society of Jesus which his predecessors had found so valuable an ally, so it is open to-

any one to hold that all organized religious Orders may deserve any one to hold that all organized religious Orders may deserve suppression, the mischiefs arising from such organization exceeding the benefits. However, it is no part of our present object to argue this question; and those who will most appreciate and enjoy Dr. Newman's admirable gifts of thinking and writing will not be those most likely to be swayed by the dogmatic inferences which he might wish them to draw, but will rather feel that there is more in common between him and them than either he or they would at first have been disposed to allow. they would at first have been disposed to allow.

THE TREASURY OF LANGUAGES.

WE were not prepossessed in favour of this book by a fly-leaf, in which the publishers "respectfully request a favourable consideration for the accompanying volume," and go on to tell us that "this compilation is the work of a literary amateur, and while liable to error, will yet be found an industrious and faithful repertory," and so on. We do not like any attempts to bias the independent decision of the judge; we do not like them the more because their effect, so far as they have any effect, is sure to be to bias the judge in the opposite way to that which is wished. If because their effect, so far as they have any effect, is sure to be to bias the judge in the opposite way to that which is wished. If authors or publishers send us their books, it is because they wish us to give our opinion of their books; it is therefore absurd and impertinent to attempt to cajole us into giving something which shall not be our unbiassed opinion. No one has a right to ask us to give "a favourable consideration" to any book; words which, if they mean anything, can only mean a request to smak of the if they mean anything, can only mean a request to speak of the book more favourably than it deserves. "Amor" and "favor" used to be disclaimed in oaths as much as "timor" and "odium," used to be disclaimed in oaths as much as "timor" and "odium," and our attornoys' bills no longer contain a payment "pro favore vicecomitis." We do not care what the author of a book is, whether a "literary amateur"—whatever that may be—or anything else. We fully feel that, like the literary amateur, like everybody else within our knowledge, we are "liable to error"; but we shall at least always speak of books, favourably or unfavourably—that is, in plain English, well or ill—according as the best of our skill and understanding leads us to think well or ill of them; and we shall certainly not speak or think better of them because and we shall certainly not speak or think well of the of them is them a favourable consideration. All that we can promise is that we will try not to let impertinence of this kind make us speak or think worse of them; the temptation to be

striven against certainly lies on that side.

There are one or two other things which we should like to know more about arising out of the short "Advertisement" which follows the title-page, as this curious fly-leaf goes before it. We are there

saknowledgment is most justly due to Mesers Bagster and Sons, for permission to use the literary matter of their interesting and instructive volume, the "Bible in Every Land;" and to Mesers. Longinans and Co., for a like favour with regard to Dr. Latham's "Elements of Comparative Philology," a laborious, learned, and useful book, without which the present volume could not have been produced.

This is at any rate better than some people who copy whole pages of other people's books without so much acknowledgment as this, and who sometimes get quoted and praised for the nutter which they have in this fashion stolen. Still we should like to know the exact meaning of the word "use" in this extract; and, though we have not very much faith in Dr. Latham, and though, among his many works we do not at this moment remember the one which bears the exact title of "Elements of Comparative Philology," still Dr. Latham has certainly reached a stage at which one would have thought he should no longer be patted on the back by a "literary amatem" as having written "a laborious, learned, and useful book." Directly after we read: of other people's books without so much acknowledgment as this,

The compiler readily apologises for any defects in his matter and manner; and takes this opportunity to thank his respected contributors, hereby exonerating them from any responsibility except for their own signed

What is here the meaning of "respected contributors"? Does it What is here the meaning of "respected contributors"? Does it mean people who have contributed, or only people who have been laid under contribution? Did the "respected contributors" really send something to the "literary amateur" for him to put in his book? or does it simply mean that pieces of their writings have been taken and marked with their names or initials? Now nobody quarrols with this last process within certain reasonable bounds. In Murray's Handbooks, for instance, to take the first case which comes into our head, it is very common to first case which comes into our head, it is very common to see rather full extracts from various writers with the names of those writers put at the end. We can bear witness that, in some cases at least, the writers' leave was never asked; but we can also bear witness that the writers have been rather pleased than displeased at height thus made were of the transfer of the present that the writers have been rather pleased than displeased at height thus made were of the transfer of the present that the writers have been rather pleased than displeased at height the made were of the transfer of the present the present that the writers have been rather pleased than displeased at height the made were of the present the present that the present the we can also bear witness that the writers have been rather pleased than displeased at being thus made use of. But they would have thought it rather queer if, on the strength of this, Mr. Murray or his editor had called them his "respected contributors," and had said that he "hereby exonerated them from any responsibility" for the rest of the text of Murray's Handbook. Then we are next told that "a list of signatures and writers will be found in the Appendix." But when we look at the end we find indeed a "list of contributors," but we also find that "the Appendix is necessarily postponed," and that "it will be proceeded with so soon as an adequate list of subscribers shall be obtained for a second volume. When we look to the list of contri-When we look to the list of contrifor a second volume.

"The Treasury of Languages. A Rudimentary Dictionary of Universal Philology. London: Hall & Co.

betters, we find some names which was familiar to the mall purposes, which are not, and Mr. Sleat, who, fan all purposes, within this island, is far at the top of the tree. And as we look through the book itself we see some very good sayings of Mr. Sleat and others, cheek by jowl with some very poor asyings, which we suppose came from the "literary amateur" himself. Some people seem not to know that a thing is only right when it is in the right place. But as, if you mix clean and muddy water, the whole is muddy and not clean, so if you put together alternate layers of sense and nonsense, the whole thus fermed is nonsense, and not sense. But before we give some specimens of the Mezonstian way in which the "literary amateur" has dealt with Mr. Skeat and his other respected contributors, we will first cast one more glance to the beginning of the book, where we find asveral pages called "Introduction on the Geographical Distribution of Languages," which we are told is "chiefly from Dr. Latham," but which bears at the end the initials "J. B.," which in the list of contributors is explained to mean "James Bonwick, Eaq., F.R.G.S., &c., &c." As no reference is given to any of Dr. Latham's many works, we have no means of knowing how much of this introduction is Latham and how much is Bonwick. We maintain that this is a way in which neither Dr. Latham nor any-bully olds ought to lastwated. At the same time in the case of maintain that this is a way in which neither Dr. Latham nor any body else ought to be treated. At the same time in the case of Dr. Latham there is a certain Nemesia about it, for we have not forgotten the story of Hore Ferdes, how we paid our money for so much Kemble, and got so much Latham instead.

The Dictionary scens to be meant to explain the technical terms of philology, and also to give some little account of various languages, but the formulæ used are sometimes very odd. We take the first page, and the first article in it we there find:-

AACHEN,
A sub-dialect of low German or Platt-Deutsch, vernacular at Aix-la-Chapelle, Lower Rhine.

ARASTES

An extinct form of speech, classed as Tunace-Lilyrian, formerly varna-cular in the L of Embau, now called Negropout or Egrapos, in the Greeian Archipelago.

ABBEVILLE.

A sub-dialect of Furner, vernacular in Picardy.

As for the Abantes, whose tongue was formerly vernacular in Enbora, it is at any rate a good while ago since it was spoken; as for the places nearer home, we must explain that Aachen and Abbeville are the names of cities, and not of languages; and that Aschen and Aix-la-Chapelle are the German and French for the same city. The "literary amateur" seems to think that Aschenis the name of a dialect spoken at Aix-la-Chapelle, and that Abbeville is the name of a dialect spoken in Picardy. Perhaps however this may be only a blundering way of expression, one of the "defects in his manner" for which "the compiler readily apologizes." We will therefore go on to some examples of the "matter," and that specially on points that concern ourselves and our near kinsfolk and acquaintance. Turning over a few pages we come to Anglo-Saxon. We will here quote the whole article:-

Anglo-Saxon. We will here quote the whole article:—

A compound language formed by the union of several tribes of Teutonie origin, who conquered and settled in Britam, about A.D. 449, thomee called England. The language is of cognate origin with the Alemannic and Gornic; but with accretions from the Scandinavian and Low Durten.

** What is called Anglo-Saxon is really the oldest form of English. The Anglo-Saxon of the first period extends from A.D. 450 to A.D. 1100; that of the later period from A.D. 1100 to about A.D. 1250; after which date we arrive at early Middle English. The specimens of the literature are too numerous to require mention. See the dictionaries by Lye and Manning, Bosworth, Grein, Ettmillier, and the list of MSS, in Hickor's "Thesaurus," W. W. S.

"W. W. S.," we need hardly say, means Mr. Skeat. But what can be more cruel than to the on this clear and accurate fragment of Skeat to the confused rubbish of the former paragraph, doubtless the genuine work of the "literary amateur" himself? We are never surprised at people putting the wrong thing; what we never can understand is when people put the right and the wrong thing side by side, and seem to think that they can somehow agree.

Me Shart is as hardly dealt with when we get to quite another

Mr. Sheat is as hardly dealt with when we get to quite another tongue. After giving a fair definition of "Romance or Romanic as "class name for all modern languages derived from Latin," though among the "chief" we find Wallachian and Romansch, but not Provencel, we come to the following :-

ROMANCE, ROMAUNT, or ROMAN.

A name awkwardly used as equivalent to Phovençal, or the Langue D'Oc of South France; thus Haynomard's Dicty, of Provençal is called "Lexique de la Langue Roman." W. W. S.

See ROMAINE.

We look with some difficulty for Romaine, and we find the same entry mutatis mutantis for the Langue d'Oil which we before had for the Langue d'Oc, and with Roquefort substituted for Raymouard. for the Langue d'Oc, and with Roquefort substituted for Raynouard. The title for Roquefort's book, by the way, is not "Glassic de la Langue Romane," but "Romane," and Raynouard was still further from such a strange concord as "Langue Romane." It looks as if the "literary amateur" had got hold of some remark of Mr. Skeat's about the confusion caused by using the word Romanea as a special name for either Provenced or Old-Franch, and had jumbled it up in this kind of way. But more than this, we get in different parts of the book the five following entries which must be taken together:—

CHURWELSCHE.

A sub-dialect of Rescauses or Researce, species in the Engedine or Valley of the Inn. Center Grisons, S.E. Switzerland. Also sailed Risegro-

ROMÁNIC.

"." It is rich in Keltik, whence its name, "Welsche," i.e. " foreign."

W. S. W. V.

under of Switzerland, vernecular on the

ROMANCE: called she Upper and Lower Enguration. It is a corruption LATER, speken in the valley of the Inn, on the confines of Switzerland th the Tyrol and Italy.

me as Churwalsone; name for the petois of La Suisse Romana as in the Rhatian Alpa.

So under " Swiss Romanes," we find " same as Rheeto Romanic."

ROMANA, ROMANESE, RUMONSCH.

A modification of LATIN, including upper and lower ENGADINE, verascular in the Grisons, Swiss Alps.

This last has brought us to the immediate neighbourhood of the entries with which we were dealing just before. Altogether the jumble is about as fine as it could be. Does the compiler know that Chaubiinden and Grisons are two names for the same thing, and that, in the sense in which he uses the words, Rectian Alps and Swiss Alps must also be two names for the same thing? But when we remember how St. Lucius became a Swiss Bishop, perhaps nothing better is to be hoped for from literary amateurs. Still we should have thought that even a literary amateur might have known that what he is pleased to call the "Patois of La Suisse Romane"—that is, we suppose, the Cantons of Vaud, Geneva, and Neufchâtel—is not Churwelsch or Rhesto-Romanic, but simply Provençal; the same, we suppose, which in another article, under the head "Swiss," is called "a Patois of French." But even these flounderings of the compiler himself are outdone by the respected contributor who signs himself "W. S. W. V." by the respected contributor who signs himself "W.S.W.V," initials which are explained in the list of contributors, W.S. W. Vaux, Esq., M.A., F.R.S. This is, if we mistake not, the same Mr. Vaux who a good many years ago wrote a book about Nineveh and Persepolis, in which the world was told "that the veteran Belisarius led the armies of the Empire against Justin and Tiberius, and was rewarded for his valour by the conquest of Tiberius, and was rewarded for his valour by the conquest of Dara and plunder of Syria." Those were the grand old days of blundering, when people went and lived twenty years in the East, and came back to explain that John Zimiskes was a Bulgarian King. But even then there were those who remarked that Mr. Vaux's description of the wars of Belisarius was very much as if one should say that Lord Nalson lad the floats. was very much as if one should say that Lord Nelson led the ficets of England against Queen Victoria, and was rewarded for his valour by the plunder of Gibraltar. The smallest progress is better than standing still, and since those days Mr. Vaux seems to have learnt something. He has learnt that Welsh means strange. nave learnt something. He has learnt that Welsh means strange. But the use to which he puts his knowledge is stranger than any form of Welsh itself. Because Welsh means strange, therefore Churwelsch, or whatever we are to call it, is called Welsh, because it is rich in Celtic. If Mr. Vaux has ever studied under M. Brachet, he must have learned that French is very poor in Celtic, yet French is called Welsh nevertheless. We will give only two specimens both of which governments and well as the content of the cont only two specimens, both of which concern ourselves. English is thus defined :-

The vernacular language of the British Empire, peculiar to England; it is an offshoot from the TEUTONIC, formed directly from the ANGLO-SAXON, with an admixture of Norman-French, and closely allied to Frislan and other dialects of Platt or Low-Greman.

Then follows Mr. Skeat's division of the periods of English; but, to say nothing else, we are curious to know how a tongue which is peculiar to England can at the same time be the vernecular of the British Empire. Elsewhere West-Saxon is defined to be

Main dialect of ANGLO-SAXON, spoken in Wessex, and the South generally, while a distinct dialog, NORTH-ANGLIAN (Northumbrian), was spoken in the North.

This is signed "G, R.," which the list of contributors explains to be Mr. George Rawlinson. The Professor-Canon would thus seem to have swooped down for a second raid upon his own land, cheered perhaps by the success of his great discoveries about Linne and Lady. It is perfectly true that Northumbrian is a different dislect from West-Saxon. Giraldus found that out a long time ago; but a series of observers from Ralph Higden to Dr. Morris have marked the fact that there is an intermediate dialect which, if the Northumbrian was to be mentioned at all, should have been mentioned also. Having once got under the guidance of Mr. Rawlinson, we naturally looked to learn something about the Alarodians and the Orthocorybantes, with whom the Professor-Canon seems so much more at home than with such hundrum tongues as Greek, Latin, French, and English. But, alas, the Orthocorybantes are not in the Dictionary at all, and under "Alarodii" we find only a reference to "Urarda," which is a case of "This road goes nowhere," as "Urarda" is nowhere in the book.

We thought we had done; only, in looking for "Urarda," we stumbled on "Ungarn," which is described to be "Testonic; High-German dislect of Hungary." Certainly when scholars like Mr. Skeat become, whether wittingly or unwittingly, "respected contributors" to literary amateurs, they sometimes meet with very strange bedfellows.

GRIKIE'S GREAT FOR AGE.

THE JAMES SERIKIE has collected into a goodly volume; in the series of very able papers in which he has within the last few years put forth in the Geological Magazine his views; as one of the upholders of the pre-glavial date of the marre of human life as co-existent with the age of the drift deposits in these islands. Hesides correlating and criticizing the diffusion opinions advanced upon the subject by the leading representatives of various systems of geology, he has an explanation of his own to offer as regards the distribution of the paleon-lithic gravels of these islands, which differs in many features from that which has hitherto been popularly held. Whilst treating primarily of Newland, it has been his aim throughtout to indicate the succession of climatic changes over an area of far wider extent, conveying as far as possible to the reader's mind for wider extent, conveying as far as possible to the reader's using an impression of the Glacial spech including not recotand alone, but also every glaciated region which has been carefully studied by geologists. Until it was clearly understood what the succession of changes during the I-vage really was, it was premature, he thought, to speculate upon the geological antiquity of those deposits which visid the architecture of the in British The doposits which yield the earliest traces of man in Britain, great difference which is seen between the famus of doubted post-glacial heds in Scotland, Northern England, Wa and Ireland, and the cave-deposits and paleolithic gravels of Southern England, had long been a puzzle to him and to other geologists alike. His studies have now brought his mind to the conclusion that none of the paleolithic series of gravels are post-glacial, but that all must be relegated to pre-glacial or inter-glacial times. For their absence from the Northern districts he accounts by their having been swept out by confluent glaciers, as well as by the action of the sea during the period of great submergences of the land. Mr. Geikie further claims to have made it probable, while bringing forward his proofs of these propositions, that a wide land-surface existed after the disappearance of the ico-sizets from the British area before the period of great subsidence had begun. We had been led to fair, from communications to cortain scientific serials bearing Mr. Chikie's name, that he was inclined to advocate the theory of convulsionism in geology in opposition to the ideas of uniform and unbroken sequence, of which Sir Charles Lyell has been the consistent and authoritative exponent. It is consequently with the greater satisfaction that we find him at the outset of his present work expressing his conviction that the deposits of this class, which were at one time "slumped together" and vaguely believed to represent a period of wild cataclysms and convulsions, are really the records of a long series of changes, each of which, as it were, flowed into the other. Apart from this guiding principle, which is scarcely less to be regarded as a postulate to be taken into the inquiry than as a conclusion arrived at by convergent trains of investigation, nothing like a consistent and harmonious lesson is to be made of the teaching of the geological record. Such gaps or incongruities as still remain in what we know of the nature must be clearly seen to lie in our own lack of material or of insucht, not in any degree in the nonconformity of nature herself. However loose and incoherent may appear at first eight the senttored nosses of matter which overlie the solid rocks of Scotland or the other mountainous series of these islands, it is only by viewing them in their natural correlation and harmour with similar accumulations covering vast areas through at the whole northern regions of our hemisphere that Mr. Geikid even his way towards determining what is the exact position in the geological records of those deposits which bespeak the earliest vostiges of human life. Having discovered, if possible, at what stage during these great climatic and geographical revolutions it is certain that man occupied Britain, the way is paved for arriving eventually at some approximately definite estimate of the antiquity of man in Western Europe.

According to this programme, it is Mr. Geikie's plan to blend into one great result the special evidences which have been adduced by geologists and archaeologists to prove the great antiquity of our race. The larger part of the work is naturally devoted to the phenomera of glacial action as shown by a careful study of the deposite together with the causes which led in the first instance to the necumulation of the enormous glacial masses of which they are the debria, and to the ultimate disappearance of the ice. Starting from the discovery of scratched or stricted atones in the valley drift, which were recognized by Robert Chambers and others as proofs of placter action analogous to those familiar to travellers in switzerland and other mountain regions, Mr. Gerkie goes briefly but clearly through the process whereby the till or lower deposit of still and tenacious clay has been haid over the rocky framework of the country by the grinding and wearing action of ponderous glacier masses, enclosing within itself these grooved and stricted stores, of which specimens are here engraved from the black shale, limestone, and clay fromstone. No fee-ils are ever found in the till, a proof of its being neither of marine nor of lacustrine origin. The aspects presented by accumulations of this material, and the way in which they are found cut through by river action as in the case of the Graskin Burn, Dumfriesshire, together with the accompanying acctions, make intelligible to the ordinary reader the phenomena of these deposits as well as of the later gravels and clays superimposed upon them. The rounded outliess of the hills and mount, in slopes, like

* The Great Ice Age, and its Relation to the Antiquity of Man. By James Gelkin, F.R.S.E., F.O.S., of H.M. Geological Burvey of Ecultand. London: Intister & Co., 1874.

those around Loch Doon, as emphatically illustrate a further aspect of nature which has been made the evidence of glacial action on a grand scale. It was not till Agassis had boldly taken the lead that geologists saw their way to connect these phenomena with the action of glacier, upon which theory soon followed that of the transportation of blocks and boulders by floating bergs of ice. Our author here takes a rapid survey of the successive and rival hypotheses advanced of late years to explain the formation and mode of action of glacial masses. From Forbes's theory of viscosity, and Tyndall's regelation theory based upon a principle of Faraday's, together with the mechanical difficulties started by the late Canon Moseley, he passes on to one of great ingenuity put forward by Mr. Oroll, which combines what is most forcible and expressive in the other two. Heat, it is well known, can be transmitted through ice without the ice melting, and indeed without the temperature of the ice being raised. The heat is simply converted into a certain amount of energy which enables the molecules to overcome their tendency to assume the crystalline form. This energy passing on from one molecule to another, the mere act of freezing being tantamount to giving out heat, the result is a contraction of each molecule, and a consequent sinking in the instant of yielding under heat, followed by an arrangion in the act of regulation. Now heat acts upon relaciors not sequent sinking in the instant of yielding under heat, followed by an expansion in the act of regelation. Now heat acts upon glaciers, not only directly from the sun, but also from warm winds and rain, from the comparative warmth of its own rocky bed, and not least from the comparative warmth of its own rocky bed, and not least from the friction engendered by its own motion. In summer-time warm water trickles and filters through innumerable cracks and fissures in the ice. Thus heat is rapidly and extensively transmitted through the glacier, each molecule as it yields under its modicum of warmth sinking downwards by virtue of its fluidity, but immediately resuming its solid form, upon which it expands, throwing back its heat to the following molecule, which in turn carries on the process. The result is a gradual movement of the whole mass downwards, as fluids and semi-fluids are uroad by gravitation down a slope. as fluids and semi-fluids are urged by gravitation down a slope. Glacier motion is thus precisely that of running water, though retarded by the crystalline form which it assumes in the intervals of melting. Heat is after all the great lover which, with gravity for its fulcrum, forces the hard masses of compacted snow and ice from higher to lower levels, causing them to spread along the clefts and gorges of the rocks, wearout down and along the clefts and gorges of the rocks, wear-ing away and polishing the surface below and on either side, embedding in the glacier mass the stones which fall upon its surface or which it wrenches from their beds, and with these for its tools scoring marks of its progress upon the hardest granite and limestone. Reaching the sea, the head of the great mass begins to float in virtue of its lighter specific gravity, broaks off with a tremendous concussion, and drifts away a mighty berg, to drop, as it yields to the sun's rays, its freight of stone or sand, which shall one day be upborne to the surface as a boulder. Other blocks are left behind to strew the bed of the glacier as its contracts, under a milder climate, the ware bullet forms at contracts under a milder climate, the more bulky fragments gathering into moraines, and the more minute débris strewing valley and plain in the form of till and lighter deposits of clay and sand. Each step in the process is traced with admirable perspicuity and fulness by Mr. Geikie, illustrated by reference to the great theatres of nature where it is even now to be seen on the widest scale—Greenland and the Antarctic barrier. By the light of existing phenomena the glacialist is in a condition to the widest scale—Greenland and the Antarctic barrier. By the light of existing phenomena the glacialist is in a condition to elucidate the action of similar physical causes in remote ages upon our own soil. Mr. Geikie's explanations, aided by his excellent topographical plans, showing the distribution of the hills and the valley deposits, with the range and direction of the strige and other marks of glacier action, supply the materials for a mental picture of Britain such as it appeared during the great ten age.

The facts and arguments welded together by Mr. Geikie point to more than one period during which the aspect of the British Isles was that of Greenland, or at least of Switzerland. A period of general submergence, put by him at about twelve hundred feet in the region of the Fintry Hills, and some two hundred feet less towards the South-east of Scotland, succeeded the first glacial sheet, which had before this begun to shrink under a relaxation of the intense cold. A still severer climate, he considers, prevailed during the period of subsidence. Though the carrying powers of floating ice during this period have, he suspects, been greatly exaggerated, it is not difficult to trace by the innumerable arratics which sprinkle the valleys and plains what were the shores and the currents of the glacial sea. The sand, clay, shells, and erratics which sprinkle the valleys and plains what were the shores and the currents of the glacial sea. The sand, clay, shells, and other organisms embedded in these deposits no less bespeak their marine origin. The great lake system of Scotland presents us with another striking chapter in the history of the Ice age. Dismissing one by one the rival theories of the origin of lochs and rock-basins, Mr. Geikie gives his reasons for attributing them, with Professor Ramsay, to the creding and scooping action of land ice. The lakes and flords lie along the axes of great glaciers, the marks of whose grinding and wearing action may still be traced, notwithstanding the accumulations of river drift, gravel, and silt brought down by streams and rivers which have obscured the withstanding the accumulations of river drift, gravel, and silt brought down by streams and rivers which have obscured the original rock-bound character of the lake-basins. Analogous phenomena are to be traced on a far vaster scale in Scandinavia. There the ice sheet seems to have reached a thickness of not less than six or seven thousand feet, the diverging marks of striction indicating a maximum elevation about the present head of the Gulf of Rothnia, the ice-cap not excepting, as some geologists have supposed, regularly outwards from the North Pole as from a centre. One of the most

one of this region, which still remains ver the researches of Forbes and the writer b striking phenor a mystery after the researches of Forbes and the writer believe us is the height at which erratio blocks are met with above the rocks which apparently form their parent hed. In Scotland granite boulders are found at considerable heights; but at Areskutan blocks boulders are found at considerable heights; but at Arestutan mocks were seen by Törnebohm at a height of 4,500 feet, which could not possibly have come from any place higher than 1,800 feet. Another class of problem is presented in the formation of the deer, or long winding ridges of detritus which form a kind of natural embankment to the height of fifty or one hundred feet, and show in maps like winding rivers or watercourses. After enumerating the many theories which have been started upon the subject, Mr. Geikie, though aware that the whole secret of their formation for found hains cleared up inclines to see in the flare with the late. Geikie, though aware that the whole secret of their formation is far from being cleared up, inclines to see in the dear, with the late Robert Chambers, a deposit analogous to the kames and eskers of our own island. They are alike devoid of fossils. Erratic blocks are frequently found perched upon them or aprinkled along their sides. A fine glacial clay containing arctic shells often covers the slopes of the dear. All the evidence seems to point towards the fact that as the kames were laid down by the swollen rivers which poured from the retreating glacial sheet during the great thaw subsequent to the first Ice age, and were next during the period of submergence remodelled by the sea, without their stratification being disturbed, so in like manner are the dear of Sweden no other than the denuded and partly re-arranged portions of old torrential gravel and sand or moraine débris. Although themselves of the strictly glacial period, these deposits have been largely overlaid by post-glacial clays, sands, and gravels, with organic remains interspersed, teatifying to the elevation of the land, the mitigation of the arctic climate, and the presence of a new fauna in many respects represented by forms now living.

(To be continued.)

RIBBLESDALE.

RIBBLESDALE would be a better novel if it read less like a blue-book, and a better blue-book if it read less like a novel. It is written in that ponderous but correct style which is only acquired by years of official labour. It contains a good deal of what is called valuable information on the state of Lancashire sixty years ago; but, on the other hand, its plots and its incidents are as uncilicial and as worthless as anything that can be found in the pages of Mr. Harrison Ainsworth himself. Its composition reminds us of nothing so much as of that drink called three-threads which we read of in Boswell, which was made by mixing three different kinds of ale in equal parts in the same tankard. At last some ingenious brewer mixed the various ingredients of the three kinds all together in his vat, and sold the compound under the name of his Entire, to the great relief of the barman, who had only to draw from one tap instead of from three. Much the same kind of relief has Sir James Kay-Shuttleworth afforded to the reading public. Instead of reading first their Parliamentary bluebook, next the old historical novel of the school of G. P. R. James, and lastly the modern sensational novel, they can get an entire mixture of all three styles in the pages of *Ribblesdale*. We certainly have found the mixture rather heavy, and such as brought on drowsiness. But then we must own that, as we care for none of the three styles when taken apart, it is scarcely likely that we should care for them when mixed up together. The author is anxious that it should be understood "that the principal characters anxious that it should be understood "that the principal characters in these volumes are not portraits; and that the incidents never to his knowledge happened in any Lancashire family." The early Greek artists, as we read in our boyhood in the pages of our Delectus, used to write beneath their pictures, "This is a tree, this a house." Sir James Kay-Shuttleworth thinks it necessary to write beneath his, "These are not portaits, these are not true incidents." However needful it may have been in the beginning of art for the painter to inform the spectator that what he saw had some real existence, in these latter days there is surely not the least need for the novelist to inform the reader that what he reads of had no real existence. Let the author be reassured. No Lancashire man would any more suspect that his family history was worked into the story of Ribblesdals than a Cornishman would suspect that his family history was worked into the true and suspect that his family history was worked into the true and veracious history of Jack the Giant Killer.

We do not know that we have ever been more puzzled with a plot We do not know that we have ever been more puzzled with a plot than in the present case, or ever felt more need of those general original tables which we have more than once urged our story-writers to give. We are to be sure in the best of company, though the heroine is only a manufacturer's daughter. But then she is an heiress, and comes in for half a million of money. But to make up for her lowly birth, we have lords and ladies, from dukes and duchesses downwards; among them a very wicked old Countess who is always called The Corsican, or The Corsican Grandmother. "She had not qualled before the sacrifice of her eldest sor, in the who is always called The Corsican, or The Corsican Grandmother. "She had not qualled before the sacrifice of her eldest son, in the most tragic manner and with true Corsican perfidy, to the pride of race and the ambition of family aggrandisement." The hero, Rufus Noel, who is the grandson of this old lady, and the supposed heir to the earldom, is always being warned "that the blood of the Corsican is in his veine," that his "race yields to the ideal, but its ideal changes," and that with it "the dream of youth has been crushed under foot in manhood, and become the interne of

* Ribblesdale; or, Lancashire Siety Fears Ago. By Mo Lines. Kay-Shuttleworth, Bart. 3 vols. Landon: Smith, Elder.

age." In spite of all these warnings, Rufus perseveres in his suit to Alice Hindle, the manufacturer's daughter. He gains her, it is true, at last, and no harm comes of it, but that does not show in the least that the warnings were not needed, for before he gains her he loses his succession to the earldom. A rightful heir turns up, and Rufus, now that he is to remain a commoner, may, we suppose, without offending Fate or the Destinies, marry whom he pleases.

The hook opens with a curious and interesting description of a Laphahire fair. In a street fight that takes place between the inhalitants of two hostile villages, the heroine, who is accompanying a poor lad, one John Spencer, to his dying uncle's bed, is rescued by Rufus Noel. A moment after up comes Alice's cousin, Robert Hindle, who is a suitor for her hand, and takes her home. But here our author shall speak for himself:—

But here our author shall speak for himself:-

But here our author shall speak for himself:—

She curtaeyed, suffled sweetly on Rufus Noel, and, taking her cousin's arm, withdrew with him and John Spencer, leaving Rufus transfixed to the spot. The traditions of his family, the dreams of his youth, the purest of his emotions, had all been commingled in one lightning that of revelation, which had vanished and left the blank of commonplace life before him.

"The Witch of Pendle and this Robert Hindle always rise up to vex my existence. She, the cancer corroding our life; he, with Saxon commonsume, endurance, and constancy, tolling like a tortoise, yet threatening to outstrip the hare. Almost making up for genius and cultivation by his rom frame and will, in our school rivalry. By his weight, wiry vigour, and dogged obstinacy, a match for pluck, science, and ardour. Can it be that this fair creature has given her love to such a man!"

He had clutched his chin with his hand, and was staring at vacancy, when a slight tap on the shoulder roused him.

The Witch of Pendle in the end turns out, to be the wirdow of

The Witch of Pendle in the end turns out to be the widow of Lord Wentworth, the eldest son whom the Corsican Grandmother had sacrificed, and John Spencer turns out to be their child, the rightful Lord De la Legh. The Corsican, finding that her son would marry a girl below him in birth, Margaret Forrester, had given her consent provided the marriage service was celebrated in secret. she had procured a forged special licence and "suborned a man not being in holy orders to appear as a priest." This "male-factor" later on gets hanged, but first makes a full confession. Lord Wentworth dies; Margaret gives birth to a dead child, as she believes, goes half-crazy, and lives in a place called the Owlet's Hole, where she is looked upon as a witch. She did not, how-Hole, where she is looked upon as a witch. She did not, however, forget the injury done her, and was determined "she would combat the wily and unscrupulous Corsican like a Fate commissioned to punish." Happily, however, there are good Countesses as well as bad Countesses. The Contessa Rufolo, who passes at times in the story under the name of Kezia Spencer, had "substituted her own courier and his wife to represent Lord Wentworth and Margaret Forester" at the marriage where the malefactor had acted as priest; while a few hours later the marriage between the real Lord and the real Margaret "was conducted by the Rev. Everard Varley, then incumbent of Curzon Chapel, Mayfair." The Contessa had been present also at the birth of the child, and pretending that it had been born dead, had stolen it away. This she had done partly to save the child's life, for she dreaded the plots of its Corsican grandmother, and partly as she "indulged the thought of producing him when of full age to claim his rights—ignorant and savage—the heir of the Noels." It is no wonder that when she made this confession of her motives, towards the close of the third volume, the Corsican "involuntarily hissed, "Ah! the viper!" in a strange utterance of rage and horror." Meanwhile the Rev. Everard Varley had also turned out a scoundrel, and tearing out the leaf from the register in which the scoundrel, and tearing out the leaf from the register in which the marriage was recorded, had fled with it to Australia. The flight agreeably varies the story, as it introduces us to criminals in a very different class of life from that of the Corsican. We get to bushrangers and a very low-born murderer, whose arrest is told at considerable length. In the end the lost tage is recovered, all the considerable length. In the end the lost page is recovered, an the villains confess their guilt, Margaret Forrester, as we have already said, turns out to be the relict of Viscount Wentworth, Kezia Spencer the Contessa Rufolo, Earl De la Legh simply Peregrine Edgar Noel, and John Spencer Earl de la Legh.

There was no doubt that John Spencer was the rightful heir, for he had on his shoulder-blade that well-known strawberry mark

which all stolen heirs have, and which, according to Box and Cox, all long-lost brothers have not. Besides what nature had done for him in this respect, art had done something more. A young Italian surgeon who had attended the child at its birth, "urged by Italian surgeon who had attended the child at its birth, "urged by the Contessa in her presence and that of the nurse, had marked the child by tattooing a small Maltese cross in the arm-pit." Besides this, "he added three small spots opposite particular vertebre of the spine." With good reason had the Coraican, when a day or two before these grand disclosures she saw in the Times the arrival of the parson from Australia, exclaimed, "There it is! Oh, my prophetic spirit! I foreboded it. So! they will have me at bay! Let them have a care!" When all comes out she makes away with hereelf by means of a mysterious ring which one of her mysterious agents, Riva, had thus mysteriously got for her:—

mysterious agents, Riva, had thus mysteriously got for her:—
"When we were last in Rome, she said to me one day, 'They tell me there is an aged man in the Ghetto who has a precious ring with a large diamond and two small turquoises. He lives at No. 84 in the Ghetto. Seek him out. Show him this parchment, otherwise he will not let you see the ring. Ask him its prica. Let me know; I intend to bay it.' I went, my Lord. I found a man, very old, but with eyes as bright as carbuncies, and a nese so hooked that it nearly use his prominent chin, for all his teeth were gone. I gave him the parchment. He took a fluid and washed then he showed me a name 'Cassare Borgia.' He brought the ring out of an iron safe. He explained to me how to manage it. Under the great diamond was a reservoir of the mistlest poises. There was a hair tube on each side controlled by the turquoises. These, when pressed and showed askis, opened the tabe and a drop of the peison exaded. I asked the price.

The second second

'The price,' he said, 'has been paid by him who brings the parchuse except a gratuity to the castodian.' I gave him a liberal gratuity, a brought away the ring. Her ladyship tried the effect of adrop of the pois on a large St. Bernard dog. The dog showed no sign of illness for sa hours. Then he was rather sleepy. He staggered when he walked: I fell into a deep sleep uttering little howis. When he woke he had no pow over his hind lags, and in two days he died. A slow but sure poison."

over his bind lags, and in two days he died. A slow but were poison."

It is a wonderful relief when this old lady does at last poison herself off. She was ever "muttering in a monologue," or indulging in reveries, and her monologues and her reveries were of vast length. On one occasion, the author writes, "her reveries might be summarized somewhat as follows:—'So De la Legh has thrown off the slough of the Sybarite with its glittering scales. The true blood asserts itself in action!'" and so on for a whole page. On other occasions he does not take the trouble to summarize even as much as this. Wonderful as are the monologues and the reveries, scarcely less wonderful are the dialogues. As we read them we feel that they ought to have been spoken before the foot-lights. We grieve over the great wasts of dramatic power, for out of this one novel the author might have made a baker's dozen of melodramas. How well would the actors who so lately played Antony and Cleopatra at Drury Lane have given out such a dialogue as the following between Parl Castlemaine and his daughter:—

"But he is not dead!"

"But he is not dead!"

"No sir, he is not dead!"

"No sir, he is not dead; he lives. Is there a fatal fascination in this race? He seems to me a substitute for Wentworth, whom I must have loved, or his memory would not revive with so sharp a pang."

"Then, Guandoline, he mistress of yourself. Do not let the mere form and somblance of Wentworth possess your fancy. Ito not shrink from the mere apparition of an early prepossession."

"I will command myself, father. I was surprised, overset. But forewarned, I have a man's nerves. Now I am forewarned."

"You are my beloved daughter. The sooner we ere away from this house the better."

"Nay, father, gratify my weakness in one thing. A wait the means of

the better."
"Nay, father, gratify my weakness in one thing. Await the report of

the surgeon."
"I will, Guendoline; but it will be midnight before we reach Greta
Castle."

Ponderous as is the talk between this nobleman and his daughter, far more ponderous is the talk between the lovers. It is as if each far more ponderous is the talk between the lovers. It is as if each had been provided with set speeches out of the Enfeld Speaker, and delivered them as schoolboys did when they took the parts of Mr. Pitt and Mr. Fox. As we read these lovers' talk we were reminded of the prints in this book on oratory, in which were shown the various postures which should be taken by each speaker in the course of the delivery. If love used to be made after that fashion sixty years ago in Isancashire, there must have been a good deal of spare time in which to make it. Doubtless, with the vast improvement in their machinery, they have learnt in these more modern days to throw off not only their yarn, but their love, at a greater rate.

at a greater rate.

The author makes one or two errors in writing of the early parts The author makes one or two errors in writing of the early parts of this century which are curious in a writer who is describing, as he tells us, times which he can himself remember. He introduces the Manchester police and detectives, a reformatory for girls, Radicals, and athletics in the University. He makes Lord De la Legh come home from the Mediterranean by way of Marseilles during the great French war. However, the story is in itself so monstrously improbable that such minor matters as these are scarcely worthy of notice.

THE VENETIAN ARCHIVES.

THE VENETIAN ARCHIVES.*

THE fifth volume of Venetian despatches takes us over twentyone years, nearly as long a period of time as was occupied by
the three preceding volumes. From this it may be inferred that
the documents in the Venetian Archives which refer to England
are more scanty during the latter years of the reign of Henry VIII.
and that of his successor Edward VI. than for the first twentyfive years of that reign. But, though fewer, they are by no means
less important. Almost from the lirst page down to the last there
appears something which throws light upon obscure points of
history, and throughout the volume there are incidents related
which will enable readers to confirm, or it may be in many cases
considerably to modify, the opinions they had formed of the which will enable readers to confirm, or it may be in many cases considerably to modify, the opinions they had formed of the character and conduct of royal and other personages who figure in the history of the period. For instance, the character of Cardinal Pole has been hotly contested, and it seems to us that Protestant historians have done but little justice to his memory. We are not aware that Mr. Rawdon Brown has ever committed himself to an unfavourable opinion of the Cardinal. But if he has, he has supply stoned for it by even going something out of his way, in his interests. unfavourable opinion of the Cardinal. But if he has, he has amply atomed for it by even going something out of his way, in his interesting preface, in the eulogy which he has thought fit to bestow upon him. Without giving the proofs of Pole's integrity and high broading with which the volume abounds, and which would occupy many pages even in the briefest analysis, we shall content ourselves with referring our readers to the preface itself, and if they have time and inclination to read so much, to the whole volume, in evidence of the truth of the opinion Mr. Rawdon Ikrown has pronounced, in which we entirely concur, never having had the least doubt that the character and conduct of the last Cardinal

^{*} Calendar of State Papers and Manuscripts relating to English Affairs existing in the Archives and Collections of Venice, and in other Libraries of Northern Italy. Vol. V., 1534-1554. Edited by Rawdon Brown. Published by the authority of the Lords Commissioners of Her Majesty's Treesury, under the direction of the Master of the Bolis. London: Longmans & Co. 1872.

Archbishop of Canterbury was that of a perfect Christian gentleman.

At the commencement of the volume Carlo Capello is the Venetian Ambassador in England, and the papers of the first seventeen months conclude with the account of England and its institutions which, according to custom, he read at the Senate upon his return. Several of these reports have found their way into print, and one extremely valuable description of English affairs was printed by Mr. Rawdon Brown in his fourth volume. Capello's report is of very inferior interest, and is much shorter than these documents usually are. This is in part accounted for by the fact that the recalled Ambassador was still suffering from the effects of an illness which had nearly killed him on his homeward journey, and partly by an omission made by the scribe who took down his speech. It is unfortunate that the part omitted contained an account of the life and character of Cromwell. So little is known of Cromwell's early career, that the Venetian Ambassador's address would probably have contained valuable information on this point. As it stands at present, nothing more is said of him than that he was a person of low origin and condition who had risen to the possession of supreme authority as Prime Minister and Secretary of State. The transcriber of the speech observes that there was no allusion made either to the late or the present Cardinal, perhaps scarcely understanding the policy of silence on such a subject—Wolsey having died in disgrace, and Fisher being in prison, daily expecting to be beheaded. The most valuable piece of information contained in the address consists in the reference to the Royal Family. And the expression of opinion of an unprejudiced bystander must be taken for what it is worth—and it appears to us to be worth a good deal—in the estimate that is to be formed as to the popularity of the King's measures after the final separation from Rome. He says that the King was so unpopular that a rebellion might break out any day and cause great confusion, and that he marvels how he should have fallen into so many error

should have fallen into so many errors and false teneta, considering his rare endowments both of mind and body. The old Queen Catharine was in a bad way and altogether neglected, whilst the King was tired to satiety of this new Queen—i.e. Anne Roleyn. In less than twelve months the old Queen had died peaceably in her bed and the new one on the scaffold.

The letters in this part of the volume are short, and do not contain much that is important. But there is one very remarkable document, the insertion of which we cannot affect to regret, although it is absolutely unconnected with English affairs, and has therefore no business whatever to appear in this volume. It purports to be an information given to the King of the Romans by the Archbishop of Cologne, the Elector of Saxony, and the Duke of Claves, as to the excesses committed by the Anabaptists at Münster, and contains a history of one of the most remarkable delusions that have ever in modern times originated a religious sect. Amongst other absurdities, too many to be here enumerated, there is mentioned the belief of these fanatics in four prophets, two of whom were just and two unjust—namely, David and John the tailor of Loyden for the former, Luther was the worst. The only other document of this year which is worth noticing is the Report of France by Marin Giustinian, son of the more celebrated Schastian Giustinian, who was Venetian Ambassador in England during 1515—1519. Like Capello's, it is unusually short, unless it has been much abridged in the analysis. It states with considerable accuracy the mutual relations of the three Powers—England, France, and the Empire—and meutions as a reason for the fear of England entertained by France, that ten Englishmen are a match for twenty Frenchmen.

Amongst the documents of the year 1537 there is a narrative of a conversation held by Lorenzo Bragadine, the Venetian Anthessader at Rome, with the Pope, which shows the estimate Paul III. had formed of his predecessor. The Pope, after complaining of the perpetual quarrols between the Emperor and Francis which prevented the joint action of Christendom against the Turks, added with reference to Charles:—"This is not the way to resist Sultan Selyman, separating Christendom from France, which has so much power and authority and military forces and money which are needed for this undertaking, unless it but hat the Emperor would fain effect our total everthrow for he it was who has been the cause of our losing Fingland, as, had he not promised to attack King Henry, Clement would not have published the sentence" (p. 53). The Pope also complained of the Emperor for being the cause of the increase of the Lutherans, whom he might have extinguished at the time of his election when the sect was insignificantly small; whereas both then and afterwards, when the Augsbury Confession had been presented, he had allowed them too much liberty in following their own fashions.

whom he might have extinguished at the time of his election when the sect was insignificantly small; whereas both then and afterwards, when the Augsburg Confession had been presented, he had allowed them too much liberty in following their own fushious.

The Pope had only recently elevated Fule to the Cardinalste, and the volume is here very full of letters from Pole to various correspondents referring to this subject. It is of course a convenience to reviewers not to have to refer to Querini for these; but we cannot help thinking that the analysis of papers already printed in books easily accessible is superfluous, and tends to swall these volumes incredinately. Querini's Collection is a book known to every one who pretends to any acquaintance with the history of the period, and the space occupied by the analysis of the latters contained in it would have been better filled by a fuller description of the new letters of Pole's which now appear for the first time.

We next come to the year 1540, where we find one of the carliest intimations of the coming divorce from Anne of Cleves.

Dr. Lingard has exposed the farce through which Convection and Parliament were forced to go by the King, who had a letter written by the Council to Clerk, Bishop of Rath and Wells, the Ambassador at the Emperor's Court, describing the whole thing three days before it took place. Contarini had come to the same conclusion, when, July 29, he wrote that "the King of England has, in fact, made his hishops declare that by no contract can the sister of the Duke of Cleves be his wife." He adds in the same letter "that the sentence was passed by the bishops on Saturday, and that the King on the following day married Catherine Howard, who was already pregnant by him." We may observe, however, that Contaring dates are not absolutely correct here, nor perhaps his facts. A few weeks earlier, writing to the Signory from Bruges, deanihing Clerk's arrival at the end of June, and in another letter of July 17, speaking of the mission of Clerk, he says:—

The cause is said publicly to be that his Majesty purposes repudiating even this last wife, the sister of said Duke of Cloves, because he had promised marriage to another woman, Maid of Honour to the deceased Queen, as you must have heard in detail from your secretary in England.—P. 85.

That the divorce of Anne of Cleves was precipitated by the desire to gain Catharine Howard for a wife has always been taken for granted; but what truth there may be in the Venetian Ambassador's representation of the case it is impossible to say, though he speaks of the fact as being so notorious that it must have been reported to the Signory from their Ambassador resident in London. Contarini further moralizes on the subject by comparing it with the case of the Landgrave of Hesse. We give this little bit of scandar as we find it, simply observing that it confirms an accusation which has been before now brought against the Landgrave, though Protestant historians have attempted to represent it as fulse. He says:—

The Landgrave has a beautiful and most amiable wife, the daughter of the late Buke George of Saxony. She is a good Catholic, and has borne him four children. But the Landgrave, being enamoured of a very beautiful girl in the service of his wife, importuned his wife to entar a convent, representing that he was eaten up by the French disease, and unwilling to communicate it to her. As she would not consent to this, he at length sont to consult Martin Luther and his companions, who stated their opinion that his lord-hip might take this damsel likewise to wife, as no divine law exists prohibiting polygamy, but the Old Testament, on the contrary, affords many instances of a plurality of wives. Your Screnity will thus perceive into how many errors, one greater than another, three who commence deviating from the Catholic faith precipitate themselves.—P. 86.

There is one other point in the reign of Henry VIII. upon which the documents contained in these papers throw some light. Cardella, in his Lives of the Cardinals (Vol. IV., p. 191), gives an Cardella, in his Lives of the Cardinals (Vol. IV., p. 191), gives an account of the mission of a Bolognese officer named Lodovico da l'Armi from Henry VIII. to Trent for the purpose of assassinating Cardinal Pole. In a book more accessible to English readers—namely, Phillips's "Life of Pole"—the same accusation is brought against the King; but the particulars are not related, several attempts to murder the Cardinal by different persons, instigated, as is alleged, by the King, being referred to without any specification of date, and with very slight description of circumstances, Da l'Armi's name not being even mentioned by this author. The Venetian Calendar, however, of the year 1545-6 is full of this man's name, which is mentioned nearly a hundred times. The first mention we have of him is in January 1545. His arrival at Venice is reported by Harvel, January 25, and the ostensible purpose of his mission was the "naking men for the King's Majesty." After this it occurs again in a minute of a despatch from the King to Harvel, in which Henry tenders his thanks to Da l'Armi for the diligent service he has done for the advancement of his affairs. The date of has done for the advancement of his affairs. The date of this despatch is March 30, 1545. In his acknowledgment of this letter, flurvel mentions Da l'Armi, and towards the end of his letter gives the King the information that Pole had not yet left Rome for Trent, but had sent on two of his servants in diaguise, one of them pretending to be the Cardinal himself. Harvel says, "I know not to what purpose such folly should be used." Nothing can be plainer from the turn of the whole Venetian correspondence relating to this man than that the Pone apprected he had a design relating to this man than that the Pope suspected he had a design on Pole's life. The Venetian Signory had some trouble in reconciling their duty to the Pope, who wanted them to benish Da l'Armi from their territory, with their fear of offending the King of England, whose servant they had allowed, contrary to their usual practice, to levy soldiers in their dominions. In August this year a circumstance occurred which gave the Chief of the Ten a very good plea for complying with the Pope's request. Da l'Armi and his men seem to have been engaged in several brawls at l'Armi and his men seem to have been engaged in several brawls at night, in one of which they assaulted the city patrol, and wounded one of the men, thus incurring the penalty of death if the crime could be proved. We are not concerned with the exact details of the story, the English version of which may be read in Harvel's Despatch in the State Papers, Vol. X. p. 563), and the Venetian account in the letter written by the Chiefs of the Ten to their secretary in England. The issue of the matter was that Da l'Armi was in his absence sentenced to perpetual banishment and to death if ever he should appear again in the dominions of Venice; and that the King, not caring to have the services of the man whom he had hired for the purpose of unathring Pole, remonstrated with the Council on the severity of their judgment, and petitioned that he should be allowed to remain at Venice. The King condenses and to report his request that Da l'Armi should still be allowed to reside in Venetian deministration for the years. The polition was heard and wasnimously rejected December 4, and again Documber 9; but the decision seems to have been reversed by a large majority the same

day, and on the next day the new Doge, Francisco Donato, wrote to the King giving the required allowance. Whether this urgency day, and on the next day the new Doge, Francisco Bonate, wrete to the King giving the required allowance. Whether this urgency on the part of the King of England had anything to do with the search purpose must of course remain a mystery to be decided one way or the other according to the estimate the reader may from of the King's character. De l'Armi arrived at Brusels and told his story with such accures as he could to the Venetian Ambassador at that Court, who of course retailed it to the Signory. He thence proceeded to England, from which he was sent in March following on a schoold mission to the Venetian territory, the Council of Trent at that time holding its first sessions. In the course of the year he was again arrested for being implicated in a murder of a sted for being implicated in a murder of a at that time holding its first seasons. In the course of the year he was again arrested for being implicated in a murder of a Venetian citizen at Ravenna. He made his escape from Venice, but was arrested at Milan just after the death of the King of England; but the authorities at Milan seem to have been most unwilling to be implicated in the case, owing to their fear of the King of England. He was afterwards by the order of the Emperor supported and the king of king of king late the his tried at Venice and was sunt there April 20. Ring of England. He was afterwards by the order of the Emperor surrendered to take his trial at Venice, and was sent there April 29, and executed May 14. We are not concerned with Da l'Armi's history any further, and indeed have only mentioned his case at all because of the relation it bears to the charge against Heury of having concerted the assessination of Cardinal Pole. And what ever may have been the weight of evidence to implicate the King in this crime, the accounts given in the Venetian despatches cartainly add to that weight. Da l'Armi was monster enough to have perpetrated such a deed. Whether Henry was wicked enough to have hired him for the purpose will be judged differently according to the estimate the reader may have formed of the character of the King of England.

We have confined our attention to the reign of Henry VIII., which scarcely occupies one-third of the volume. We must not conclude without calling attention to the very important despatches of the year 1531, which, properly speaking, belong to the preceding volume, but which, having some to hand too late for insertion there, have been consigned to an Appendix.

MEETING THE SUN.

THIS book is remarkable externally for one of the most hideo and startling covers that it has ever been our lot to behold.

On a ground of bright yellow two mysterious flourishes in red, resembling nothing so much as those triumphs of calligraphy which used to be designed by simple-minded schoolmasters, represent a dragon and a phenix. We should have taken them for a Chinese version of the lion and unicorn fighting for the crown, which last object is suggested by a mysterious circular figure in gold. Mr. Simpson, however, informs us in his preface that the whole design is intended to symbolize the marriage of the Emperor of China, which is the principal event commemorated in his pages. Internally, we are happy to add, the lover of art will find something better. The book contains a number of spirited illustrations, which have been reproduced by the heliotype process from woodcuts in the Illustrated London News. Mr. Simpson, in fact, was the Correspondent of that newspaper and of the Daily News on the occasion of the Imperial marriage. The letters which he wrote to one of the papers form the letterpress which accompanies the illustrations. It may perhaps be said without offence that newspaper correspondence does not often bear reproduction. In fact, when a man is obliged to fill a certain number of pages with the best material that offers itself, it is scarcely possible that the interest should not occasionally be rather thin. Now Mr. Simpson is a thoroughly competent Correspondent; he has been in many parts of the world and gone through some interesting experiences; he has travelled in Thibet, been in the Orimean war, and at the Abyssinian Expedition; and, in short, is gold. Mr. Simpson, however, informs us in his preface that the Orimean war, and at the Abyssinian Expedition; and, in short, is an excellent specimen of that class of traveller who does not explore unknown countries, but is sure to turn up in any corner of the world from Paris to Peking where any exciting events are being transacted. And yet we must in candour add that Mr. Simpson with all his experience has not quite learnt the art of making bricks without straw. The letters were doubtless interestmaining bricks without straw. The letters were conditions interest in a state time; but a good many of them have become rather flat. The book has therefore the rather serious fault that there is a good deal too much of it. There are, as we shall presently show, some very good chapters; but a severe critic might possibly be inclined to condemn a great many pages as very little better than respectable padding. The author has, however the merit of pointing out to respect with a few records. as very little better than respectable padding. The author has, however, the merit of pointing out to persons with a few months to spare how they may employ their time, and see a great many curious things which are not as yet completely hackneyed. A man of literary and artistic tastes would probably prafer to spend a long holiday in visiting the civilized world, and making himself acquainted with the accumulated treasures of the great European centres. But then many people, otherwise of highly estimable character, have no artistic or literary tastes. They would often do more to enlarge their minds by travelling round the world than by lounging in churches and picture palleries, of which the higher meanings do not reveal themselves to the uninitiated. A very interesting tour may be made, and doubtless will soon become popular, by visiting the Sees Canal, dropping in for a few days upon India, oatching a glimpes of the Great Wall of China, ascending Tokohama, crossing the Pacific, visiting the Yosemits Valley, and

· Meeting the Sun. By William Storgern. London: Longmann & Ch zinge.

returning home by way of the Salt Lake City. If that goog is carried out within a few months, a man earnot expect to trate very deeply below the auchoe; but if he is a fairly observer, and has some holdly to secure food for thought, probably come home with a few new ideas. We have at the general outline of Mr. Simpson's book. We will add the the general outline of Mr. Simpson's book. We wan sum un-has the qualifications which we have suggested. His can things as a man is likely to see them who has a quick moss over his pencil; and though he does not go wany desply into a or archaeological questions, he has a hobby is the study of ten-and is fond of various social and historical inquiries which make an agreeable companion. We could have singued his account voyage down the Red Sea in a P. and Os steambook, for, if we not mistaken, we have read very much the same margetive as voyage down the Red Sea in a P. and Ch steams not, for, if we are not mistaken, we have read very much the same nametive several times already. We doubt whether he got far below the series of Chinese life during the few weeks of his stay. But if we do not make unfair demands we can turn ever his pages in very gund temper, and part with him on excellent terms.

Omitting all mention of the less interesting parts of his book, we may come at once to the marriage of the Chinese Emperer. Various travellers have remarked that the inhabitance of the Calcutial Kunpire are not so far wrong as we are inclined to fintter

Celestial kimpire are not so far wrong as we are inclined to flatter ourselves in their contempt for the outside barbarians. We do not Celestial kingire are not so fir wrong as we are inclined to fister ourselves in their contempt for the outside barbarians. We do not assert, nor does Mr. Simpson, though a friendly observer, maintain, that they are at a higher stage of civilization than ourselves. But it is true that, if we have some things to teach them besides the consumption of opium, we might take a few hints in return. Amongst these we should be atrongly inclined to seaken the mode of conducting State marriages. Mr. Simpson, looking at the matter from a professional point of view, is naturally inclined to find fault with their whimsical inversion of the European practice. We, regarding the same question from the point of view of readers instead of writers of newspaper reperts, feel that they have much to say for themselves. When an Emperor is married there is of course a grand procession. The Chinese, however, instead of calling upon all the world to look on, have their processions in the middle of the night, and barricade all the approaches to the street in which it is to take place. The consequence is that very much less opportunity is given for graphic delineations of the scene, and that everything is done with the utmost privacy. We rucken this as an advantage; but Mr. Simpson, who went all the way round the world to witness the ceremony naturally considered himself to be rather injured. However the Correspondent is irrepressible even in Chine. The managed to recurs a place behind a window looking upon the scene of the ever the Correspondent is irrepressible even in Chins. He managed to secure a place behind a window looking upon the scene of the procession, and was thus able to gratify the readers of the Illustrated London News with a faithful representation of the interesting event. We fear that these things are only too easily conesting event. We fear that these things are only too easily converted into an allegory. The pushing Western world is everywhere forcing its way through the thick barrier of Chinese custom, with what result remains to be seen. It is highly probable that when another Emperor marries, he will have a Correspondent at his elbow throughout the ceremonial, and have his speeches taken down for the benefit of the listening world. The interviewer is abroad, and the coy East scaks in vain to oppose his progress. Indeed Mr. Simpson succeeded in gathering a certain amount of gossip which shows that with all precautions even Chinese majesty cannot quite escape the gaze of the world. We learn, for example, that the new Empress is a lady of considerable literary acquisements, and showed her tasts soon after her marriage by refusing to allow her studies of the classics to be interrupted by the vulgar intrusion of breakfast. The fact reminds us that Mr. Simpson caught some glimpses of the working of the competitive system in this its ancient home. He does not, indeed, give us any account of the papers which are set, nor do we accuminally understand what are the qualifications which entitle a man to be the "Chwang-Yuen," or senior wrangler of the Chinese Empire. However, he saw the examination-hall in which the unfortunate students, some of whom examination-hall in which the unfortunate students, some of whom go on to the age of seventy or eighty, undergo their tortures. The nclosure, he tells us, resembles a cattle-market. It is surrounded by a wall to keep out all intruders, and in the centre is a tower, whence the watchmen guard against all communication with the candidates. There are ten thousand cells, in each of which a student is confined. They are locked up on three successive occasions, and on each occasion for three nights and days. Tea and food are supplied, and scaled paper is given out to prevent the introduction of previously prepared manuscript. The cells are so small that it is difficult for a stout man to get into one or to turn himself round in it, and Mr. Simpson gives a very thrilling illustration of a place of torment compared with which any meat before Civil Service Examiners or in Oxford or Cambridge schools must be luxury itself. We are not surprised to learn that the examinees are occasionally found dead in their cells, in which case a hole is knocked in the wall and the body thrown out to avoid opening the gates.

Mr. Simpson recommends a study of the whole system by intallighted the wall of the whole system by intallighted the wall of the whole system by intallighted. gent English travellers. Some youthful member of Parliament might perhaps find it worth his while to relieve his studies of king-books by a personal inspection of the details. He will possibly me what is the state of society at which we shall arrive in a few

Mr. Simpson made two or three interesting little extends.

China, but we have only space to mention one other elimination one other elimination are the entered on the arms the example of the entered on nala an as this examination arrangement, which we strongly common attention of energytic clery years in their normal assistance.

to say, endeavouring to raise funds for charitable purposes. Mr Simpson saw an enthusiast in a Buddhist temple which was in need of restoration. He was locked into a kind of small wooden sentry-box. A hole in the side enabled him to pull a string which worked the hammer of a bell. He pulled it every few minutes to attract attention to his position. He had only just room to sit upright, and a number of large nails were driven through the side of his box with the points projecting inwards. Whenever a benevolent person paid a sufficient sum, one of the nails was extracted, making the position of the inmate rather less uncomfortable; and a piece of paper was pasted on the spot with the name of the donor. This is really a very ingenious device; and we would suggest to any pariah in want of a new church that they should catch a popular clergyman and immure him in such a box in some public place. The effect would no doubt be striking; and he might deliver sermons from his permanent pulpit with singular emphasis. The Ohinese devotee in question was, it seems, to be shut up for three years; but probably it would be better to make the duration of the imprisonment depend on the amount of the subscriptions. Perhaps, however, some preachers would then have to look forward to a rather excessive term.

The most amusing page in Mr. Simpson's book is perhaps that in which he cives a receiver of the subscription of the imprison that in which he cives a receiver of the subscription of the subscriptio

would then have to look forward to a rather excessive term.

The most amusing page in Mr. Simpson's book is perhaps that in which he gives a specimen of pigeon-English—a language which, according to him, is spreading with great rapidity, and possibly destined to establish itself permanently as a means of communication even between natives who speak mutually unintelligible dialects. At present it can hardly be called graceful. The fragments which we give are taken from a translation of "Excelsior." We will only add that the phrase "galow" is said to be untranslatable; but that it has the effect of converting "topside" into an exclamation nearly equivalent to "excelsior." Here is a verse or two; the whole-pour is given in Mr. Simpson's pages. "Markey" means "notwithstanding":—

That mighty time begin chop-chop.

That mighty time begin chop-chop,
One young man walkey—no can stop—
Maskey snow! maskey ice!
He carry flag vid chop so nice—
Topside-galow!

Him muches sorry; one piecey eye
Lookes sharp—so—all same my
Him talkey largey—talkey strong,
Too muchey curio—all same gong,
Topside-galow!

The stanza about the fulling avalanche and the St. Bernard monks who hear a voice fall through the startled air become:—

"Take care ! that spoil 'um tree, young man !
Take care that ice, he wont man-man."
That coolie chin-chin he good-night,
He talkey " my oan go all right."
Topside-galow!

Joss-pidgeon man he soon begin Morning-time that Joss chin-chin, He no man see—him pleuty fear Cas some man talkey—him can hear, Topside-galow!

We look forward to the translation of Shakspeare into this delicious dialect. Meanwhile we will only add that, on his way home, Mr. Simpson showed the characteristic spirit of an English Correspondent by diverging to the Modoc war, and apparently running a very considerable risk of leaving his scalp in the lava beds. We congratulate him on his safe return, and hope that he may find many more opportunities for enlightening the British public.

A SMALL COUNTRY HOUSE.*

hand for all that they want, are eventually unable to finish to their mind within their proposed margin, that any judicious pocket-counsellor must needs be of service to them. And Mr. Kerr's little volume is all the more useful because he does not overload his subject with collateral considerations, but confines himself to advising the proprietor about to deal with bricks and mortar how he may do so without disappointment and vain regrets. It fills a gap which is not provided for either by Mr. Kerr's exhaustive work on the "Gentleman's House" or by Mr. Gervase Wheeler's more compondious Choice of a Divelling. The first of these might give valuable hints to a millionaire who condescended to look into details before building himself a country seat; the second applies to ambitious house architecture in town or country experience which has been gathered among our Transatlantic cousins, who well know how to get comfort for cost in house-building. A Small Country House appeals to a section of society whose architectural flights are of necessity limited, and which is concerned in incurring the least possible amount of unremunerative expenditure. It need not shake our confidence in our guide to learn that he accounts the English country house the best residence in the world in point of comfort, domesticity, and family enjoyment. Home-keeping by taste, we have come by experience to a general understanding as to the sine qual none of the domestic dwelling; and the result assuredly is, in the main, as Mr. Kerr affirms. But, though "use doth hased a habit in the man," and, in our author's words, " a

perfect stranger ought to have no difficulty in telling, while it is as yet quite empty, not merely which is which throughout the whole number of apartments, but which is the proper place for every essential piece of furniture in every room of a house," it is astonishing how many minds fail to grasp the mystery of "plans, sections, elevation, and perspective." They are constrained to take on trust the elucidations of their architect, which, had they been apprehended in their true significance, might have prevented the larder being planted just where there is no draught and much sun, or the thining-room in a position where the heat will be insufferable at the very hour of its special use. Such mistakes may be avoided by due attention to the book before us, as its aim is to plan the rooms of a house step by step, and even to arrange the characteristic furniture of each in its proper place, the architect instructing the novice in far less professional language than one is accustomed to hear from an expert.

A primary question in the planning of the house and its rooms is that of aspect—a matter of greater moment than prospect, though this is never ignored by a clever architect. Unspect, though this is never ignored by a clever architect. Unlike the suburban villa, which must accommodate its face to the road, the country house can turn its back to this and to the north, and secure, if possible, a south aspect. An eye to land-scape gardening assists the projector of a house in making the best of the natural features of his site; but the principle should be to get his chief front and outlook south, and facing the lawn and flower-garden, whilst the approach and shrubbery should be no the north and cast. On the whole there is no better aspect and flower-garden, whilst the approach and shrubbery should be on the north and east. On the whole, there is no better aspect for any living-room than the south-east, inasmuch as it catches all that can be desired of the morning sun, and is in shade very soon after the hour of noon. If the considerations of aspect and prospect clash, the latter must be sacrificed, unless we are prepared to accept a baking dining-room to westward, or a drawing-room looking out on a north terrace, "swept from end to end by the east wind." But, as we have said, a little cleverness may usually effect a compromise. A room may have windows in more than one wall; or, to get over the difficulty of including prospect, recourse may be had to projecting windows of various form. The nooks and crevices and unexpected ins and outs of a room thus rendered irregular become not seldom its most dea room thus rendered irregular become not seldom its most dea room thus rendered irregular become not sentom its most delightful lounges, and leave an after-memory in the minds of quests who would regard one room built and windowed "on the square" as very much the same as another. There can be no exception taken to the sound maxim that, if the aspect of the lawn front is south or south-east, the entrance should be from north or east, so as to leave the south and west for the garden. A north entrance is colder than one to the east, but double doors or a portice obviate this drawback. There is, however, no solecism in building so deplorable as that of bringing the drive round to an entrance in the drawing-room front—an intrusion on the privacy to which the owner is reasonably entitled. With such privacy to which the owner is reasonably entitled. With such privacy, it may be remarked, a western approach with a western lawn would interfere, as would also a public road on the south. If either are unavoidable, the landscape gardener will have to be summoned to the rescue with shrubs adapted for planting them out; but the necessity need hardly arise if a site be deliberately chosen. There is no harm, by the way, especially with an architect alive to landscape-gardening, in having the office and entrance front identical. scape-gardening, in having the office and entrance front identical. All working-places, store-places, larders, and dairies require to be cool, and if the windows seem too inornate to harmonize with a dignified approach, it needs but to call in the intelligent gardener to assist in screening or disguising them. We observe that Mr. Kerr lays down a rule that there must be no "back" to a house—a rule somewhat puzzling to old-fashioned folks. The meaning of it is that the kitchen-yard, laundry-yard, or stable-yard, which is overlooked by the least important of the four fronts of a dwelling-house, must in these days be externally designed with as much care, if not cost, as those which are to meet the eye of more distinguished critics. One reads in novels, and now and then sees still in actual life, back settlements about country houses which are the very model of discomfort and ill arrangement, whilst the guest chambers and front halls are all glorious and stately. glorions and stately.

As to internal arrangements, Mr. Kerr gives the first place to the dining-room, with which the service communication from the offices must be direct and immediate, and the route to which from the drawing-room should be spacious, and, as far as may be, stately. The nursery population would no doubt make it another requirement that this route should pass the main staircase, at the top of which it is, we believe, their immemorial custom to watch the procession as it wends its way to consume those cates and viands which the "cherubs aloft" contemplate only in imagination. On the whole, the aspect of the dining-room should be S.E. for morning sun and evening shade; but if it stand sideways towards N.E., with a window facing that way and a bay to the S.E., such an arrangement is not to be despised. As to shape, the dining-room should be oblong, and there should be a service door or hatch, besides the main door. Mr. Kerr has defined the place of the sideboard, which is an important piece of furniture; but we wish he had found space to discuss an even more important matter—the dining-table—touching the make and build of which we concur strongly with Mr. O. L. Eastlake, that some improvement on the ancient Jacobean pattern would be very far better than the modern telescope table. As to the directness of route from the entrance to the dining-roum, we demur to one argument used in its favour—namely, that it is often used as a room of audience or a "speak-a-word" room. This is much better confined to the

A Small Country House: a brief Practical Discourse on the Planning of a Residence to cost from a cool. to 5,000l. By Rubert Kerr, Aspisiteot, Author of the "Gentleman's House." Landon: John Murray. 2874.

study, odd room, or syen servants' hall. About the drawing-room and its arrangements Mr. Kerr gives some excellent hints. It should look on the laws, and, if possible, open upon it, so as to admit sunshine without sultriness, and court summer breezes, whilst impervious at will to unwelcome wind and weather. In the drawing-room we must to some extent study prospect, in order to preclude the familiar grievance of a lost view; but here, too, a supplementary window may give what is lacking in the chief aspect, and, after all, it is to be remembered that "prospects" tire, but aspect really substress comfort. Moreover in houses where there is a morning-room of consequence enough to allow of the drawing-room being what Mr. Kerr calls preserved—i.e. kept for state occasions—the prospect of the drawing-room is of less moment, as not likely to provoke discussion when the shades of evening are making one view as obscure as another. The terrace and lawn are important accessories to the drawing-room, and it is not amiss to have easy outdoor access from it to the conservatory; but house-planners should beware of connecting the conservatory directly with the drawing-room, morning-room, or even vestibule, as it involves interference with the ordinary ventilation, and is much better detached. Some directions are given for the position of the principal staircase with reference to the drawing-room, the front door, the principal bedroom, and the back-stairs. It may be made the chief feature of a central hall, and minister not a little to its state and consequence. We do not think, however, that it should be visible, except indirectly, from the entrance; on the other hand, it ought not to be in a corner. With it and with the entrance a little excess of spaciousness is not undesirable, and this is a legitimate consideration in the building and planning of a house.

One of Mr. Kerr's most interesting sections concerns the library, though he gauges the average Englishman only too correctly when he gives him the option of a study or business-room instead. Here is the distinction:—

A proper library in a good house is the public morning-room of the gentlemen, for correspondence, newspapers, light reading, or indoor lounging. A study in a smaller house or a parsonage is a smaller room which the master reserves for himself, or in which he accommodates his books. A business-room is very much the same as a study, the distinction rather than difference being, that the occupant is professedly a man of business, and not a student.

A library ought to be in the general group of public rooms; a study may be placed "on the line of demarcation between the family part of the house and the offices," or even over it. It obviously serves better than a library would the purpose of a room of audience. Tastes may differ, and there are doubtless many who, to secure the billiard-room, which they think not even "a small country house" should be without, will put up with a study instead of a library, and devote the difference in cost and space to the 24 feet by 18 which they require for their hobby. But what a dreary place it is, unless when the balls are in motion I and, on the other hand, what aglow of comfort and friendliness reigns in the book-clad sanctum where tables and chairs are arranged conveniently as regards the light, the fire, and the door, where we would have the mantel-shelf as like as might be to that represented in Mr. Eastlake's Hints on Household Taste, and in which on a rainy day the most perfect of lounges is to be found. An illustration in the Life of Dean Alford exhibits a pattern of what a worker's library should be as regards recessed windows, the arrangement of desks and tables and the like. But this room in a new house should be the special home for old oak furniture, which that at the Deanery of Canterbury does not seem to have been, and we miss the busts or statuettes which should surmount a bookcase if it does not reach the ceiling. The library too, if any room, pleads for exceptions to the rule of a square house, which, our author argues, is the most simple, symmetrical, and saleable. It is much improved by projections, irregularities, and recesses in the wall-space.

We can only give a casual glance at the offices and the bedrooms. Basement offices are a makeshift for which there is little excuse or occasion in the country. Moreover, they would be usurping the place of the cellars, which are even a greater consideration in country houses than Mr. Kerr appears to think they need be, for the dry and well-ventilated receptacles of wine and beer. Not a little influence on the ripening of wine may be ascribed to careful planning of the cellar department, and though it is said that abroad wine is sometimes best matured in proximity to the roof, it may be doubted whether our English stowage of it is not best and fittest. Coal-cellars, mentioned in p. 71, are, we should think, as inconvenient as they are needless in the country; but it is a good hint that a cold larder may find its habitat under the ground-floor with advantage. Larders above ground, and indeed everywhere, require ventilation as well as coolness, and the aspect for their windows should be, if possible, north. Mr. Kerr justly attaches great importance to the arrangements of the butler's pantry, but we do not hold with the desirablences of its opening into the serving-room, or of its having a butler's bedroom attached. A more unquestionable advantage is that it should look out on the drive. A most important matter in planning a house is to shut out the sight, sound, and smell of the offices from the family apartments; and, by parity of reasoning, the nursery corridor should be out of earshot of the guests' bedrhambers. It not unfrequently happens that the wider of the cook's operations, eleverly enough excluded from the entrance or staircase corridor, accounds through the nursery passages, and finds its way to the very quarters from which on the ground-floor it has been successfully excluded.

Ingenuity may be tested in preventing this; as also in nontriving to get the bath-room contiguous to the guest-chamber front, without imperilling the decorated cornices and ceiling of the drawing-room or dining-room. Perhaps it should find a place in the nursery corridor, as handy as may be to the best bedrooms. There is sound wisdom in prescribing, as is done in p. 80, nurseries for every house, even though there is no immediate need of them. They will serve for bedrooms till the need arises, though we do not advise the excessive forethought of a bachelor incumbent (the first of a series of such) who not only provided nurseries for his new parsonage, but also a wicket-gate at the top of the back stairs, to prevent the children is posse from tumbling down them.

Stables and coach-houses form no part of Mr. Kerr's plan, which is perhaps on that account not so comprehensive as it might have

Stables and coach-houses form no part of Mr. Kerr's plan, which is perhaps on that account not so comprehensive as it might have been. We might add that in new country houses it is sometimes found possible to provide a prayer-room, which avoids the awkwardness of this family institution clashing with the preparations and gatherings around the breakfast-table. We have seen its want supplied by a happy adaptation of a passage or corridor. But it is invidious to hunt for omissions in a book which provides for every reasonable want.

LLANALY REEFS.

ADY VERNEY writes with such good intention, and at times so well, that we deeply regret her want of sustained dramatic power, and her frequent lapses into a certain welliness of treatment; defects which ought not to be allowed to mar the effect of so much idyllic sweetness, and such an accurate knowledge of the places and people of which she treats. She is evidently thoroughly at home on the Welsh coast; and she describes both the scenery and the manners with touches full of that almost unconscious graphic power which is only to be got by perfect familiarity. But with all this cutside perception and notable use of local colour, she fails in that subtle exposition of character which constitutes lifelikeness; and the action of her little story drags, while her plot, thin as it is, becomes now uncertain and now confused. There is a fatal as it is, becomes now uncertain and now continued. I need is a later want, too, of motive in some parts which vitiates the reasonableness of the story; as, for instance, the preservation by Evan Evans of the obscure and well-nigh illegible scraps of paper he had found on the body of poor drowned John Caladine—scraps of paper of on the body of poor drowned John Caladine—scraps of paper of no earthly use to him or his, of which he never sought to make money, and which he kept from those concerned, one scarcely knows why, seeing that he got no gain by them, and that he did not seem to have rightly understood their dishonest value to himself by the loss which they were to others. Also we think that the vacillation of the young sailor Piers between his cousin Grace and Winifred Caladine is scarcely consistent with his own nature or with itself. If he had really loved Winifred, even through the triple trial of her levity, her coquetry, and her refusal, was it quite natural that in his moments coquetry, and her refusal, was it quite natural that in his moments of peril he should have thought only of (irace? And, again, was love for Winifred of the kind to commend itself to an earnest, self-restrained, (Iod-fearing man, such as he is described, one to whom marriage would be a thing of far more serious import whom marriage would be thing of the pleasing of the senses? The best men of the class to which Piers Owen belongs think more gravely of marriage than do the gentry who are swayed by a variety of social considerations wanting to the poorer sort; and a variety of social considerations wanting to the poorer sort; and a girl with as much solfishness and as little true worthiness as Winifred had in the beginning of things, would have found to subjugation of a steady-going religious fellow like Piers a harder matter than Lady Verney has allowed. "I have laid it before the Lord, but He has not directed me," was the answer made by a Cornishman of Piers Owen's stamp, when asked why he did not marry. This was said quite simply and sincerely. Pretty girls and tempting women might abound; but the Lord had given no sign to the pious Wesleyan; and he would have thought yielding to the fascinations of sense, dignified though they were by the name of love, such as those to which Piers gave in so readily, a yielding to the temptation of Satan and a profanation of the holy yielding to the temptation of Satan and a profanation of the holy spirit without which no marriage is sanctified. These are the minor points of character in which writers of good social position so often fail. They judge of human nature as they know it, influenced and modified by the circumstances and education of their own class; and unless they get deeper into the hearts of the people than is usual with the well-to-do classes, they do not understand the strangely different influences which stir and compel those

of a lower grade.

The motive of Lianaly Reefs, to judge by the concluding nots, is a protest against the unseaworthiness of ships and the "radical wrong" of our present system of insurance; and by far the best bit is the description of the shipwrock of Piers and his crew in the rotten old Mersey off Cape Horn. In this description Lady Verney goes into details with praiseworthy accuracy; and yet there is a curious look of cataloguing through it all, as when she speaks of the "stenches" of the forecastle—"wet, foul, dark, and quite unventilated"—the measurement of the Pacific storm wave, the general rottenness of all the material of the Mersey from first to last, and how "the tarpaulins were too small to cover the hatchways, the stuff was full of holes, and perished with age and exposure." The picture of Piers's calm determination, which seemed as if it had influenced even the crazy hull of the Mersey

Liency Rays. By Lady Verney, Author of "Stone Edge," "Lattice Links," &c. London: Smith, Elder, & Co. 1372.

to do her best, is well laid in. We extract the following, which reads rarely well for a lady writer, and as if written from practice experience, or, if Lady Verney will forgive us, as if she had been well coached in the technical terms:—

Well coached in the technical terms:—

But the height to which the sea had by this time risen made it impossible to run any longer before the wind, and to lay to was now her only chance. Already a broken sea had passed over her, nearly carrying the helmann overboard, and putting her in imminent joopardy. Piers summoped all hands on dack, and stationed each man at his post—every opening was fastened down, the mizen staysail was set, and the ropes manned for taking in some of the canvas forward; then he took the helm himself, and watched and waited. At length there seemed a slight buil; he put the helm hard a lee, and waved his hand as a signal to the mate at the forecastle. As the ship flew up to the wind, he saw coming down to windward a luge mountain of water, and selzing a rope's end, he had barely time to secure himself hurriedly to the mizen mast when the roller fell on the deck. All around him, above, below, all was water, green water, and for a moment he thought that he was being carried to the bottom with the ship—but the end was not yet. Slowly the vessel recovered herself, and freed her deck from the weight of water, which would have sent her to the bottom if it could have found its way below; the after sail brought her head up to the wind, and she lay comparatively safe; but the boats had all been shattered, rendered useless, or carried away by the shock, and two hands were missing when the danger was past.

The next paragraph, too, is good, and the significance of the rounding query becomes important read by the light of the last note; but the real value of the extract is in the union of, as it seems to us, experimental knowledge, whether at first or second hand, with a certain poetry of feeling evidently the authoress's

The bad weather became worse; the wind chopped and changed perpetually, while from each quarror seemed to come the coldest and stormiest of the blasts in succession: from the south they blew straight out of the icy solitudes round the Pole, and from the north off the cold, barren, snowy rocks of Torra del Fuego, the most inhospitable land in the world; east or west seemed all allke in the wintry freding; the men were wet from morning till night, and chilled to the bone by the cutting wind and the hall, so that they could hardly massage the sails. They had pretty nearly, however, now rounded the Cape. "She must feel her own way must part," said the old mats, as, in the storm and the sleet, she began to turn her head northwards. For still the gale was at its height; the fierce wind blew the crest of the waves in sheets of water to leeward, the short day was closing in, and dull blackness overhead; but if all held on, a good ship should have ridden out even such weather in August off Cape Horn. Was the owner at that moment sitting, enjoying the sultry evening with his wife and children round him, and the comforting thought that all risks were fally insured if the Mersey" did not reach home?

The end of all is the utter destruction of the foundered ship, and the temporary salvation of Piers with ten of his crew on a raft which he built and superintended, "standing over each lashing and seizing, to see that all was thoroughly done and no nails used in the construction." The suffering that followed; the hunger and thirst; the men falling off the raft one by one from fatigue and weakness; the shapeless mass of spars lying as a speck in the vast ocean, and almost in the jaws of death; now a porpoise speared; now a few drops of grateful of death; now a porpoise speared; now a few drops of grateful rain, "caught in their linen and a tin cup or two"; an albatroes, which had been following in their wake, swooping down on her prey as the mon slipped from their frail refuge to the death that was so near; the disappointment, mingled with superstitious dread, that possessed them when, drifting up to a strange object, they found a water-logged ship — "the light shining through the blackened timbers, hung with barnacles and seaweed, the stanchions standing out bare and ragged against the sky"—which all but Piers avied was the "Frence Partcharge and aways they would Piers cried was the Flying Dutchman, and swore they would not go an inch nearer; the stuper of starvation deepening; the old mate, poor Piers's last comfort and chief help, in his turn falling like a stone into the "yeast of waves"; and, finally, the rescue of the five men left out of the ten who had been on the raft when she first pushed off from the ill-fitted Merseyall this Lady Verney tells with force and pathos. It is a remarkable bit of writing for a woman, unless she has been indeed assisted by an experienced hand; and should even a few minor technicalities be inexact, that does not mar the power of the whole. It is during these days and nights of wretchedness and peril that Piers thinks continually of Grace. He and the crew sing a great deal in the earlier time, and before that "stupor of starvation " which comes later has made them indifferent to starvation" which comes later has made them indifferent to life itself. They sing "sea-songs, hymns, anything that anybody could recollect"; "but there was one couplet which rung in Piers's cars day and night, and it was always in Grace's voice that it seemed to sound." "He could hear it so distinctly that he wondered the others did not perceive it also; he almost seemed to see the singer. It was always Grace now of whom he thought; help the singer. It was always Grace now of whom he thought; help and comfort seemed to come naturally through her lips, and to be connected with the very thought of her." Yet on his return home, notwithstanding that he pays Grace so much attention, and is on such terms of loving friendship with her that her own long-cherished love for him seems as if it may now take courage and be glad, he suddenly drifts back to his old entanglement of feeling for Winifred; and the end of the book sees them married and happy, with Grace holding their baby and sweetly content with the second place. This Grace is a divinely unselfish and saintly character; but we owe the author a grudge that she did not give her a higher fate by making Winifred find her duty and her happiness elementary here.

Part of the story is connected with a certain "Quillet"—that is, "a piece of Owen Griffith's best field, which had been left away to a daughter (after the fishion of the country) by some far-off ancestor. It had descended to an old woman as obstinate as Owen

himself in defence of her rights, who insisted on her intention to leave it to her nephew, instead of to the direct line and lawful owner, as Owen considered himself to be." The disputed corner was "not much bigger than a pocket-handlerchief," but it was the one shadow in Owen's otherwise radiant lot, and the standing grievance he could not quite get over. The litiglousness of the Welsh character is well touched on here. For all that Owen Griffith is the "good denue" of the story he is find of lawyers and her character is well touched on here. For all that Owen Griffith is the "good demon" of the story, he is fond of lawyers and law courts, and is for ever hankering after the Quillet, the boundary stanes of which gave his plough an awkward turn, while the light of way leading to it interfered with his beans. This grievance about the land is connected with the story by the subsequent proposal of David Hughes, the nephew of the obstinate old woman who is in possession, to Winifred Caladine, when the matter might be brought to an amicable arrangement. His method of offering himself is quaint enough: himself is quaint enough :-

"So, miss, you is sout for a walk this so fine evening. It is well so, as I want to speak quite particular, and it shall be best altogether without my aunt. You must know already this so long while since my desires. Now I shall wish suggest myself for to marry ourselves direct. You shall be a great comfortable to me at the mill. You have no parents for to dwell with —mine is so nice home. When shall we be wed?"

mine is so nice home. When shall we be wed?"

But Winifred, who had her heart now full of Piers, as she formerly had her heart full of young Harrison, turns a deaf ear to the Welshman's reasoning, and answers to his assurance that "everybody shall tell you it is quite conformable," "But I don't care what they says; it isn't 'everybody' that's got to be married; it's me!" In which view of the case we think sho is singularly rational. The main thread of the story, however, is bound up with the papers which Evan Evans took from the corpse of John Caladine, Winifred's father; with which papers are connected a scampiah brother who made off to South America with what did not belong to him, a paid debt and no vouchers forthcoming, and the subseto him, a paid debt and no vouchers forthcoming, and the subsequent impoverishment of the widow and orphan—the latter being this same Winifred who is left to the guardianship of Owen Griffith. All this part about the papers and the debt is a little confused in the telling, and not very clearly made out in the design. Legal matters are seldom treated in a satisfactory way in novels, and Lady Verney only follows the multitude when novels, and Lady Verney only follows the multitude when she defines hers less clearly than might have been. Add too the dialect, which somewhat perplexes the unaccustomed reader, though we are happy to say the spelling is less uncount than many other authors would have given it, and we have reason enough for our sense of confusion. There are other graphic sketches on which we have not touched; such as the danger of Piers in his walk across the sands, and the "crossing of the herds"—with the imminent peril of the white heifer, who, "instead of enduring passively the discipline of pain with the mass of the crossing multitude," leapt from the ranks, and very nearly drowned hersolf in a miniature maelström. Both are photographic, and evidently taken from the life. taken from the life.

On the whole, though we cannot welcome Limity Reefs as a masterpiece, we can praise it heartily as a pretty, well-intentioned, and in parts excellently written, story—the best parts being the descriptive, the weakest the psychological.

GERMAN LITERATURE.

CARL VON NOORDENS History of the War of the Spanish Succession • deserves an honourable place in the series of useful, practical, and workmanlike histories with which Germany is at present enriching European literature. The works thus collectively indicated may be described as all bolonging to the school of Ranke, and as the works of writers who have rather made it their task to elucidate the obscure and tortuous policies of Cabinets than, like Michelet or Macaulay, to paint graphic panoramas of the life of nations. Their common peculiarity is their diplomatic character in both senses of the term—the extent to which they depend upon archives now for the first time brought to light. depend upon archives now for the first time brought to light, coupled with a most praiseworthy sobriety in the use of these materials. Von Noorden's History, an admirable type of the class, is evidently based upon a thorough knowledge of the politics of the period, manifested in the condensed presentation of results rather than in the accumulation of references, and never pedantically obtruded. At the same time, the more ordinary and tra-ditional qualities of an historian are by no means wanting, as is shown in the lucid treatment of battles, sieges, and campaigns, and in such masterly summaries as the brief sketches of the condition of Poland and Portugal at the opening of the war. Though nominally restricted to Spain, the scope of the History is in fact a very wide one, extending over the whole of Europe, all the members of whose body politic were participators in the conflict. It comprehends the years 1705-1707, including such brilliant feats of arms as the battle of Ramillies and the steepe of Barcalona, a general survey of the condition of the North of Europe, and a miniature history of the Union of England and Scotland. Several remarkable personages are described, who had been amitted by former historians, as, for example, the intriguing Primate of Poland; and justice is rendered to several interesting transactions hitherto left in the shade, such as the Primee of Darmstadt's successful defence of Gibraltar. shown in the lucid treatment of battles, sieges, and campaign

August von Benfiel's sollection of documents " re-story of the Guerran Empire during the sixteenth less to be a most unbushle storehouse of State pape was dimeetria e The first releas to be a most unbushle storehodes of State papers. The first values, ambrasing the pariod from 1546 to 1551, alone comprises 553 documents in 980 pages. They are nearly all despatches from smoward heads and ambrasadors, some formal and official, others confidential diplomatic reports. Among the latter the correspondence of the Spanish Ambassador at Rome during the Conclave of Julius III., which so nearly resulted in the election of our countryman, Cardinal Pole, is particularly entertaining. The private correspondence of Charles V. and his brother Ferdinand is very valuable. Some of the documents have been printed already, but in many cases inaccurately. The more innortant papers are given in many cases inaccurately. The more important papers are given at length, others are summarized with considerable fulness. It is to be hoped that so extensive an undertaking may be completed on on which it has been begun.

The additional details of Napoleon's journey from Fontainebleau to Elba †, collected by Baron von Holfert, cannot be said to add much to our knowledge of the subject; the compiler nevertheless deserves the credit of having prepared, from old and new sources, a very attractive book. The whole situation is highly dramatic, and one of the most memorable examples of the vicinsitudes of greatness. We can hardly consider it so derogatory to Napoleon as it appears to Baron von Helfert. The position of a great sovereign and mighty conqueror disguised as a postilion to escape reign and mighty conqueror disguised as a postilion to escape being torn in pieces by his own subjects, and indebted for his life to the protection of his enemies, is indeed sufficiently painful and ridiculous, but the diagrace attachee rather to the mob than to the victim of their fickleness and ferocity. Passive courage was not Napoleon's forte; but, on the whole, he seems to have encountered a poculiarly trying peril with as much self-possession as could reasonably be expected in a man of his excitable temperament. Baron you Helfert adduces some strong reasons for disbelieving in his

alleged attempt to commit suicide at Fontainebleau.

Madlle. von Assing's last is generally her best; and this time she has surpassed all former feats in the way of book-making and mystification. "From Varnhagen's Remains, Letters Home from the University", would of course be generally interpreted as the title of an addition to Varnhagen's own valuable correspondence. On discovering that they are no such thing, but simply the letters of a hitherto unheard-of Adolph Muller, and that their sole connexion with Varnhagen is that he had them in his possession and at one time thought of editing them, the temptation to throw the book out of the window is nearly irresistible, and would be whelly an if any probability with the the distinction which wholly so if any probability existed that the fair editor might at the moment be passing along the street. Failing this inducement, we turn to the letters, but can find no adequate reason for ment, we turn to the letters, but can find no adequate reason for their publication. They are certainly very creditable to the writer, but only as might be the case with the correspondence of any amiable, earnest young man, accustomed to discuss serious subjects with youthful frankness, and ardent in the expression of his family affections. If they have any value, it is as indications of the direction in which the student mind of Germany was then tending, and of the influence exercised by Fichte, Schelling, and Novalis, the Carlyles and Ruskins of 1804-10. The writer, a young physician, died prematurely; many circumstances connected with his death are extremely touching, but ought never to have been published. The most characteristic passage of the book is the preface of Madlle. Assing herself, in which she observes that having been taxed by evil-disposed persons with violating private confidences and publishing rubbish, she desires all such to take notice that she does not value their remonstrances one straw, but proposes to labour in both vocations even more abundantly for the future. luture.

The autobiography of Louise Scidler & belongs to a very different class of literature; it is as full of matter as it is simple and genuine. The author, a lady artist, attained no particular eminence in her profession, and does not seem to have been remarkable for intellectual gifts; but her cheerfulness, helpfulness, and ardent though unobtrusive admiration of everything excel-lent, qualified her to be the humble friend of numerous distin-guished persons, whose kindness she has repaid by recording her sequaintance with them with perfect good feeling and good taste. She was patronized by Goethe, and finds an evident pleasure in dwelling on the numerous instances of his benevolence. Her iwelling on the numerous instances of his benevolence. Her requaintance with him immediately preceded the death of his The household was then more tranquil than had always on the case. Goethe's attachment to a partner apparently so matched with him is attributed by Fraulein Seidler partly to his respect for genuine nature in any form, and partly to Christiane's tact in withdrawing troublesome and disagreeable matters from his attention. At a later period we find our artist in Rome, where she resided many years, and was intimately acquainted with Niebuhr, Bunsen, Henriette Herz, Cyerbeck, and other edebrities, all of whom are noticed in a genial and amiable spirit. The pleasant little book has suffered in some degree from

the infirmity of the author, whose sight failed her

death.

Professor Stark * is an archeological scholar, and artiquation topics form the principal portion of his very interesting travels in Greece and the Turkish Levant. He was at Ephesias when his Wood's excavations commenced, and gives a clear account met movely of the site of the great temple, but of the topography of the ruins in general. He also describes Troy, Sardes, and the Niobe rock, as well as the recent discoveries at Athens, adding an exquisite photograph of a new baselief. He has not the leman eye for the aspects of modern times, far the picturesque and varied bustle of Constantinople, the inconveniences of quarantime at Sym, and the pleasant domestic life of a cultivated Greek family at Athens. His view of Greek progress, so far at least as the development of His view of Greek progress, so far at least as the development of intellectual life and the revival of industry are concerned, is highly encouraging, and he leaves us fully impressed with his composition

to pronounce upon the subject.

Bruno Bauert, at one time named along with Strauss and Feuerbach as a loader of the revolutionary school of theology in Feuerbach as a loader of the revolutionary school of theology in Germany, has of late years fallen into almost complete oblivious. Not a little screness on this account is apparent in his recently published volume, in which he carps discontentedly at the more popular works of Strauss and Papular and Advisor and Advis popular works of Strauss and Renan, and tries to outbid both by a paradoxical attempt to make I hilo the originator, not merely of the Alexandrine doctrine of the Logos, but of New Testament

theology in general.

The Grand Duchy of Baden ‡ is in a manner classic ground in the contest between Catholic States and Catholic Churches, the Baden Government having begun their endeavours to restrict the power of the Church at a period when nearly all others were treating it with deference. The quarrel seems to have extended to nearly every subject on which the two powers can come into collision, and to have resulted in a complete victory for the State, which its historium the Finil Friedburg regards as of harms approve for the historian, Dr. Emil Priedberg, regards as of happy augury for the result of the greater conflict now pending in the Empire. It would seem, however, that the Baden Government abstained from an-

result of the greater conflict now possing in the limpins. It would seem, however, that the Isden Government abstained from anvenoming the strife by any needlessly barsh or offensive proceedings. Dr. Friedberg's work, which is written purely from the legal point of view, is of great value, if only from its copious appendix of official documents. It must be said that his own style seems formed upon the modul supplied by these papers.

The philosophy of Edward von Hartmann is becoming more and more the subject of discussion in Germany. The main ground of its success, apart from the ability and liveliness of its exposition, is no doubt that of all existing philosophies it is the least metaphysical, and the one in which the greatest respect is paid to the observations of physical science. Hartmann would never have committed Hegel's error of quarrolling with Newton en source a priori grounds. His views are wholly based on the scrattiny of nature. The theory deduced from this observation presents no striking novelty. Hartmann's "Unconscious" is mercely Spinosa's natura naturans regarded from the point of view of modern science; and in its practical application his philosophy reproduces the ethics of Schopenhauer: The Spinozistic and Schopenhaueristic halves of the system seem to have no mecanicy conservation. halves of the system seem to have no necessary consection. Spinoza, the most consistent of thinkers, was ossentially an optimist; and the difference between him and his modern rep sentatives sometimes seems rather a matter of bile than of brain. Such would seem to be the opinion of the younger Fichte, whose latest and almost testamentary work is evidently called furth by Von Hartmann's, though this writer's name rarely occurs in it. The sanity and sobriety of l'ichte's ethics are refreshing after the gloomy paradoxes of Schopenhauer's school; his windication of Theism is more difficult to appreciate, from his adherence to the old metaphysical terminology. It seems evident that the ideas which metaphysicians find so much difficulty in dissociating from this peculiar dialect have already become the property of the world in a simpler and more intelligible way. P'ichte's canaging candour and equitable temper are beyond praise; the latter part of his essay betrays a tendency to mysticism, not unshared by Hartmann, who is far from treating narratives of somnambulism sentatives sometimes seems rather a matter of hile than of brain. Hartmann, who is far from treating narratives of somnambulism and clairvoyance with disrespect. Dr. Volkelt's | essay on the two main factors of Hartmann's philosophy is another important contribution to the history of the subject. The writer is a disciple of Hegel; his method is strictly metaphysical, and he seems not to average that the resolution of foot disciple to the subject. apprehend the revolution effected in abstract research by the progress of natural science, a revolution only comparable to that effected in science itself by the application of the inductive method of

is an able and temperate defence of the existing institutions of Germany as the best adapted to the actual situation, without, however, confesting the possible abstract superiority of forms grounded to practice under certain contingencies. The author's main test of the expediency of an institution is apparently the degree in which it tends to maintain power in the hands of an enlightened class.

enlightened class.

Dr. Baumann has performed an eminently acceptable task in his able analysis of the political philosophy of St. Thomas Aquinas*, to which he has prefixed a lucid and interesting essay. Aquinas hardly appears to have made any great original contribution to thought in this department; his principal achievement is to have harmonized and combined the two infallibilities between which he found himself. His system is built upon the foundation of Aristotle, on which, the works of the Stagirite being sileat on the subject of Papal infallibility, the latter dogma is easily superimposed. So long as Aquinas adheres to Aristotle he provokes no subject of Papal infallibility, the latter dogma is easily superinposed. So long as Aquinas adheres to Aristotle he provokes no other comment than that his adhesion is very close; but when he supplements his master's theory by the assumption that good government and morality are not to be regarded as an end, but simply as a measure to the ulterior object of cternal felicity, and the further assumption that this is only to be obtained within the bosom of the Church, he is logically committed to a theory of persecution. The gist of Dr. Baumann's reasoning seems to be that consistent Catholics cannot avoid being persecutors in theory, unless in the exceptional case allowed by Aquinas—namely, when they are not strong enough. At the same time Dr. Haumann does not seem inclined to depose the Infallible Church morely to set up the Infallible State in its room; and expresses his apprehensions lost some of the views recently broached respecting the ethical mission of the State should tend to the establishment of a despotishmas permicious as the ecclesiastical to intellectual freedom, if less perflous to life and limb.

The condition of Alsace and Lorraine for the last three years in the description of the State and Lorraine for the last three years in the description of the State and Lorraine for the last three years in the condition of the State and Lorraine for the last three years in the condition of the State and Lorraine for the last three years in the condition of the State and Lorraine for the last three years in the condition of the State and Lorraine for the last three years in the condition of the State and Lorraine for the last three years in the condition of the State and Lorraine for the last three years in the condition of the State and Lorraine for the last three years in the condition of the State and Lorraine for the last three years in the condition of the State and Lorraine for the last three years in the condition of the State and Lorraine for the last three years in the condition of the State and Lo

The condition of Alsace and Lorraine for the last three years is justly described by Dr. Schriker † as one of anathy and interregnum. The people have had to sit still while others have been legislating for them in a capital which, though assured that it is their own, they persist in regarding as that of an alien and an enemy. It is therefore a serviceable performance to bring together enemy. It is therefore a serviceable performance to bring together in one compendious collection the laws by which the political life of these provinces is henceforth to be regulated, as well as the debates which reveal the animus of the enacting parties. To judge by the recent elections, this well-intended performance has not effected much towards the conciliation of the Alsace-Lorrainers; perhaps, however, as it is in German, they have not read it. It will be found very uneful by foreigners who, whether from an appreciative or a critical point of view, may desire to study German methods of dealing with a conquered territory.

The history of the system of communication in Alsace-Lorraine must necessarily be mainly of local interest. Herr Löner I appears

must necessarily be mainly of local interest. Herr Löper ‡ appears to have been a diligent collector of everything relating to the

subject.

Though dealing with abstruse questions of Oriental jurisprudence, and bristling with Sancerit quotations of terrific appearance, Ir. Mayr's treatise on the Indian Law of Inheritance 5 is nevertheless snything but dry. Treating of the domestic life of an ancient civilized people, our kinsmen in blood, and not alien in intellectual organization, it incidentally throws much light on the development of culture and social order in Europe. It is divided into three sections, respectively discussing the general principles by which the distribution of property was regulated, the degrees of succession, and the position of the female sex with reference to this subject.

subject.

By hearkening to the note of the cuckoo the immortal Wordsworth was temporarily impressed with the conviction that this so solid-seeming earth was in reality but an unsubstantial fairy place. Something of the same illusion is evoked as we listen to the practical Director of the Prussian Post Office—the inventor, we believe, of post-cards—seriously discussing the feasibility of the amployment of balloons as an auxiliary to the regular post. || Dr. Stephan is, indeed, far from asserting the practicability of this improvement at present; he regards it however, as an aim to be kept distinctly in view, and gives his reasons for the faith that is in him. He is not perhaps altogether exempt from the usual fallacy of projectors in inferring from the opposition excited by railways, telegraphs, and similar inventions, that everything received with a corresponding incredulity must be equally feasible—a manifest abuse of the argument from analogy. We must add that it will take a great deal to convince us that a belloon sent up from Paris corresponding incredulity must be equally leasible—a manness abuse of the argument from analogy. We must add that it will take a great deal to convince us that a belloon sent up from Paris was ever found in a bush in Natal. Dr. Stephan, however, is perfectly right in drawing attention to a fact commonly ignored—the steady if tardy progress of the scientific method in serostation, and the tendency of every improvement to increase the seronaut's control over his machine. It is also apparent that there are parts

MR. DISRAELI'S COVERNMENT.

THE composition of Mr Disraph's Government has received general and just approval. The return to the old practice of keeping they number of the Cabinet within reasonable limits does credit to the Prime Minister's judgment. The Chancellor of the Duchy, the President of the Local Government Board, and the Chief Secretary for Ireland have in recent. Administrations been admitted to the section of the Board of Trade; whose office is more important than that of Postmaster-General. It as probable that personal intendship may have induced Mr DISRAII II that personal whendship may have induced Mr 1982111 to prefer Lord John Manners, who has already held Cabinet office. All the other Cabinet Ministers preside over the great offices of the State. In Mr Grabetone's Ministry the Postmaster-General remained outside the walls of the Cabinet, while Lord Hartmaner, Mr Forsier, Mr Starsfeld, Mr. Chichester Fortescue, and Mr. Brucht the Cabinet, the Cabinet Fortescue, and Mr. Brucht and Mr. Cabinet and Mr. Brucht and Mr. Cabinet and Mr. Cabinet Contract which port conference of the cabinet and Mr. Cabinet and M represented in the Cabinet departments which now confer only a lower rank. No official experience is required to justify the assertion that a confidential executive Council of sixteen is too unsafely for its purpose. The clustic arrangements of moder Cabinets have been adopted, not for convenience of deliberation, but because it was thought necessary to find room for members of the party whose claims were deemed to be irresistable. One consequence of undue laxity of admission has processarily been the practical institution of a Cabinet within a Cabinet, consisting of two or three members of the body who enjoyed the special confidence of the Prime Minister. The secession from Lord Debry's Government at the beginning of 1867 might probably never have taken place if Lord Salisbury, Lord Carraryon, and General Peri had been previously admitted to the grant data of the Prime Minister and the Changeller. to the centidence of the Prime Minister and the Chancellor of the Exchequer To a certain extent there must always e a distinction between the consultations of the Chief Minister with two or three chosen colleagues and the comparatively public deliberations of the Cabinet When the number of Cabinet Ministers was limited to five or six, a Minister of secondary rank complained that, when a Council was field, Mr Pirr used to whisper Dinnas is the window, and then announce that the busi-tions was over. Nevertheless the unfluence of each member of the Cabinet on general policy is likely to increase as the numbers of the body are diminished. The confidence of the country in the present Government will certainly not be impaired by the knowledge that its more important measures will have been previously approved by Mr. Hardy, by Sir Stafford Northcore, by Lord Salisbury, and by Lord DERBY. The PRIME MINISTER is better known to the country than even the most eminent of his colleagues, and at present be is unitoutedly popular; but his warmest admirers would scarcely claim for him the quality of being uniformly sound and habitually safe. Mr. Lown's fear that Mr. Distance weald institute a personal Government of his

ear, Diseased would institute a personal Government of his own proves to he wholly unfounded.

It is fortunate that the Duke of Abercorn has at last consented to resume the Irish Viceroyalty. A nobleman of less popular demander and of less magnificent tastes would have contrasted answerably with Lord Spences. It is not worth while to revive the controversy whether the maintaining of the office of Lord-Lieutenant conduces to the bellet despetch of public business. for there can he was

might be desirable to try the experiment of appointing one of the Queen's some Lord-Lieutenaut. During the continuance of the Home Rule aguation the change would perhaps be regarded as a concession; and, on the other hand, it is possible that demagogues might offer deliberate affects to a Royal Vicercy who avowed his intention of magnitaining see Union Sir Michael Beach, though he hold a subordinate office in the last Conservative Adminis-tration, has still to establish his character as a statesman. It is perlups no disadvantage that he is a stranger to Ireland, but he is not to be congratulated on the smoothness of the task which he has undertaken to perform.

Mr. Brinstra has formerly proved his competence to discharge the functions of his office as Changellor, and Dr.

Ball would perhaps have been promoted to the higher office if his services in Parliament as Attorney-Goneral office if his services in Parliament as Attorney-General had not been regarded as indespensable. It is surprising that Mr Disraeli has not availed himself of the services of Mr. Plunklit, Dr Ball's colleague in the representation of the University of Dubin. None of the younger members of the House have givengreater proofs of Parliamentary ability; and every appointment of a capable Irishman to office furnishes an additional argument against separation. The Lord Advocate is fortunately the only Minister who is specially charged with the Government of Scotland; and there could be no dispute as to Mr. Gordon's claim to his former office, especially as his sett is not likely to be contested contested

Sir Charles Addenter's reputation as an intelligent, conscientions, and useful man of business has not been ingroundy affected by Mr Britan's norse and characteristic
rudeness. It has always been Mr. Butan's help to nice
political criticism, with personal insult; and to his recent
boast that he has never been adject that he has never been
classes it might have been added that he has never been courteous to an equal who happened also to be an opwould be placed at the Local Covernment Board, with the sanitary business of which he is perfectly familiar. It is possible that some Minister of higher rank, or even Mr Diskart himself, wishing to reserve to himself the control of local legislation, may have objected to place in charge of the department an active advocate of consolidation and improvement whose emnions have been consinuation and improvement whose equations have been frequently published. The President of the Board of Trade has but few definite duties, for the greater part of the important business which is transacted in the office necessarily devolves on permanent functionaries and professional assistants. No other public department more urgently requires supervision and reform. If Sir C Apin active supervision from the induced development of the It's succeeds in providing for the judicial discharge of the many judicial duties which devolve on the Board of Trade, he will correct one of many flagrant abuses. The appeantment of Mr. Cave to the office of Judge-Advocate can only be explained by the difficulty of finding places for computent candidates. Possessing much economical knowledgess well as general ability, Mr. Cave would have been well snated to the Fresidency of the Board of Trade, while he has no special qualification for the duties of Judge. Aflyocate. It may be presumed that, as a competent judge of personal character and manners, Mr. Diseasest has exerto personal character and manners, Mr. Distance has exerto personal character and manners, Mr. Distance has exertop of the office of Lord-Lieutenant conduces to

has been better liked or more generally trusted; he may possess little technical knowledge of hais habits of business will enable him readily to ter his new duties.

The Under-Secretaries of the different departments por seas among them considerable merit and promise. Sir H. Selwin-leberson probably appreciates his good fortune in escaping the responsibility of his Beer Bill, which was with self-denying generosity adopted by Mr. Bruch. The licensed victuallers may be well assured that, while the elections of the last three years are frosh in Mr. Disraeli's manners. memory, no Under-Secretary will harass them with vexatious legislation. Mr. Bourse's knowledge and ability will be valuable at the Foreign Office; and he will represent his department in the House of Commons with efficiency and prudence. efficiency and prudence. Lord GEORGE HAMILTON has his business at the India Office to learn; nor will his energy and spirit for the present enable him to meet on equal terms the exhaustive criticism of Mr. Grant Duff. Mr. SCLATER-BOOTH, who is appointed President of the Local Government Board, was formerly Secretary to the Poor Law Board, and he holds a good position in the House of Commons. Mr. Clare Read, the first tenant-farmer who has held political office in England, possesses a thorough knowledge of rural affeirs, and his moderation and good sense have been generally acknowledged whenever be has taken part in debate. On the whole, the secondary places are not less carefully filled than the great offices of State. A strong Cabinet, backed by an ample majority, in no immediate danger of factious opposition, has the additional good fortune of not being pledged or tempted to enter on a career of ambitious legislation. The most urgent duty presses on the SECRETARY of STATE for India, but his activity for the present will be rather administrative than Parlia-The first important business of the Session will be the Budget, and it is to be wished that the arrangements proposed by the CHANCELLOR of the Excureguer may deserve the confidence of the House of Commons.

THE FALL OF COOMASSIE.

THE former accounts from the Gold Coast gave reason for hoping that the Ashantee war would be terminated with no sacrifice of life, except that of a few officers and men who had already fallen victims to the climate. The rapid alterentions of fear and satisfaction which have succeeded one another during the present week have impressed on all minds the serious nature of the undertaking. It is now known that in the latter part of January all negotiatious were broken off. The King of ASHANTEE seems to have appreciated the superiority of his enemies, and to have been willing to make a preciated. and to have been willing to make a nominal submission on terms which might not too seriously compromise his repu-tation with his subjects and neighbours. Reports of the formidable character of the invading armsment had apparently produced a salutary panic which found expression in mirroulous portents corresponding to the popular creed. There is probably a good understanding between Church and State in the Ashantee country; and the sudden collapse of sacred trees and images as soon as the English soldiers crossed the Prah might have indicated the conviction of the King and his advisors that resistance was impossible or inexpedient. For reasons which are rather conjectured than accurately known, the Kina entertained an insuperable objection to the admission of the English army into his capital. Although he had released his European prisoners, and expressed his readiness to make peace, he finally determined to oppose the further advance of the hostile force. In a battle on the 31st of January the Ashantees must have displayed remarkable skill and courage; for, notwithstanding the superiority of the English weapons and disci-pline, Sir Garner Wolseley suffered in killed and wounded a serious loss. The telegraphic messages which were published in London on Wednesday evening contained the rumour at Cape Coast Castle that the General was stationary at a place fifteen miles from Coomassie in want of reinforcements, and that a large body of the enemy was threatening his flank and rear. On Thursday morning the general anxiety was relieved by Sir Garner Wotseler's despatch dated from the capital, which he had entered after five days of hard fighting. The King had promised to make peace; and it is to be hoped that he will keep his word, as a breach of faith would be self-word for a renewal of hostilities. followed by a renewal of hostilities. The enemy may

perhaps not have discovered the urgent pressure of time which induced Sir Gamer Wolfeley to contemplate the commencement of his return march on the following day. It cannot be said that the result of the campaign is as satisfactory as its conduct has been honourable to the General and his little army. It seems scarcely worth while to spend large sums, to lose many valuable lives, and to undergo five successive days of hard fighting, for the purpose of remaining two days in the conquered capital. The compare small things with great, Sir Gamer Wolfeley is in a position analogous to that of Napoleon at Moscow. Having forced his way to the centre of the enemy's power, he is now principally concerned to secure an immediate retreat. Fortunately the Ashantees have no adequate means of knowing how much trouble and anxiety they have for six months caused to their adversaries. The resources of England are in fact sufficient for all similar contests, and to an uncivilized enemy they may well seem to be boundless.

The English troops will probably have been re-embarked about the present time in accordance with the original plan of the campaign; but Sir Garner Wolseley will undoubtedly take sufficient precautions before his departure for the security of the settlements on the Coast. The Ashantees will scarcely be disposed immediately to renew their incursions, although they may perhaps be acute enough to understand that for three-quarters of every year they have nothing to fear from a European force. Garrisons of moderate strength, properly armed and protected by fortifications, will be able to repel any attack to which they may be exposed. It will not be the duty of the Commander-in-Chief to anticipate the decision of the Colonial Office on the policy which may be ultimately adopted on the Gold Coast. The short war has thrown light on various points which will be duly considered by the Government. The Ashantees have at last proved that they are formidable in the field; but the chief difficulties of the expedition might be avoided on future occasions, if it were thought worth while to construct and maintain a military road from the sea-coast to the Prah. It might also be found possible to organize a system of carriage which would ensure in case of need the conveyance of provisions and other stores; and, if necessary, one or two advanced military posts might be established to protect the communications. The means by which border tribes are communications. The means by which border tribes are kept in awe or subjection are familiar to all who have occasion to provide for the security of the outlying portions of civilized empires. The Bussians in Central Asia, the English on the frontiers of India, and even the Americans in the Indian territories, exercise constant and successful vigilance in guarding against produtory or hostile incursions. The Ashantee war would never have occurred if the English authorities on the coast had been strong enough to render the invasion hopeless or hazardous. West African garrisons must necessarily consist of coloured troops, their discipline and weapons ensure them the superiority in defensive war over any possible assailants. expense ought not to be immederate, although it must of course be balanced against the advantages which may result from a continued occupation of the Gold Coast.

The Colonial Office and the Cabinet will not fail to examine with dispassionate attention the reasons which may be urged in favour of the extension, the maintenance, or the abandonment of the former Protectorate. The late Ministers were not called upon to form a definite resolution before the termination of the war. Mr. Baight indeed, with his customary indifference to official reserve and Ministerial responsibility, expressed at Birmingham a strong opinion in favour of withdrawal from the Coast. Mr. Gladstone in one of his election speeches confined himself to the utterance of a conventional hope that the war would be followed, not only by peace, but by cordial friendship with a defeated enemy. Lord Kimberley may be supposed to have given more serious and practical consideration to a question which directly belonged to his department. There is no reason to suppose that his final conclusions might not have been the same with those which will be adopted by Lord Carmarvon and his colleagues. The timidity and indolonce of the Fances have not increased the general desire for any more intimate connexion with a worthless and cowardly race. The moral duty of civilizing barbarons subjects and neithbours scarcely extends to a population which will notifier fight nor work for those who fight in its behalf. The half-educated natives who practical a constitutional Fantee Con-

Goldratien will not again be able to impose on English Governors. The officers who were employed to lavy saxi-liary forces in the neighboring districts have made the further discovery that even the more warlike tribes cannot be trusted in a war with the Ashantees. Of some thou-sands of native troops which had been raised by Captain Gaovan only a few hundreds could be persuaded to keep their gagements when their services were actually required. Even the Houses belied the reputation which they had formorly acquired. The result of the campaign may perhaps diminish the fear and deference with which the Ashantees have been regarded; but it will be im-possible to reckon on the courage of the Fantees or the fidelity of the Houseas.

As, according to the French proverb, a door must be open or shut, the settlements on the Gold Coast must be either kept and protected or relinquished. There may be some temptation to prefer the easier and cheaper course; but there would be an anomaly in deducing from a victory the consequences which would have ensued from a total defeat. A part of the territory which Mr. BRIGHT proposes to abandon was acquired by treaty from Holland only a year and a half ago; and although the modification of the restrictions on Dutch aggrandizement in Sumatra formed the principal consideration of the bargain, a sum of money was paid in partial compensation for the posts which were coded to the English Government. The older possessions have been held for two centuries, including the short period in which the merchants trading to the coast undertook the functions of government. It is true that the chief use of the settlements was formerly to facilitate the slave trade; but for many years more legitimate commerce has prevailed. If, on the withdrawal of the English authorities, the French or the Dutch were to occupy the vacant settlements, the contrast would not be gratifying to national vanity. On the whole, the Government will probably determine to retain Cape Coast Castle and other trading posts, but not to undertake the obligation of protecting the neighbouring tribes. Ashantee invasions would in any case be repelled by force, not because they are directed against the Fantees, but because they interfere with English trade. The Ashantees have an aptitude for commerce as well as for war, and they ought to be disabused of the suspicion that the English desire to impede their peaceable access to the coast. If the burden of maintaining the settlements is found to be too heavy, the coast can at any time be evacuated. On the other hand, immediate abandonment would be not only unsatisfactory, but irrevocable.

THE HOUSE OF LORDS AND THE MINISTRY.

BEFORE the fate of the late Government was sealed, and while it seemed worth while to see whether exaggerated language might not be of some use, Mr. Lowe drew a dreadful picture of the consequences that would follow it Mr. DISRAELI were invested with power. He would rule his party, he would rule the House of Commons, he would rule the House of Lords. In short, he would be a Dietator, and a very dangerous one. So far as this was not mere rhetoric invented for electioneering purposes, and a sally of audacious paradox at which no one in culmer times would have been more amused than Mr. Lowe himself, it pointed to a peculiarity which no doubt does distinguish a Conservative from a Liberal Ministry. When a Liberal Ministry is in power the House of Lords acts chiefly as a restraint on the Government and on the dominant party in the House of Commons. It passes some measures that it dislikes, or the machinery of politics could not go on. But it alters them, weakens them, postpones them so far as it thinks asie, and rejects altogether Liberal measures not supported openly by the Government, or Ministerial measures which are not backed up by ontside popularity. Its main function is that of a check on the House of Commons, and in ordinary discussions on general politics it is assumed that this is the special and permanently important function of an Upper Chamber. When enthusiasts thank Gop that there is a House of Lords, they mean that they feel a delight, which they are pleased to invest with a religious character, that a measure they dislike is subjected to the A debate on India was in the last Parliament a mere farce, regision, and possibly to the condemnation, of a Second. The House of Commons knows nothing about India, and, Chamber. When again a new Upper Chamber is to be if possible, cares less. It was willing once or twice a year invented, as at present in France, every ingenious politician to permit the languid amusement of hearing Mr. Fawcar puzzles himself to devise some placellale method of getting and Mr. Bounce show that there were spots in Mr. Carer together a set of persons who shall not be entirely out of Dury's serene sup, but it took no real interest in the sport,

harmony with the representatives of the motives, and exercise an independent judge enormous difficulty of creating such a body wiscest theorists of most countries, and Continental philosephers who own the usefulness of the House of Lords in England point out that it is to our luck rather than our wit that we owe the possession of such an institution. But when a Conservative Ministry with a good working majority comes into office, the character of the House of Lords is certainly very much changed. The same set of men influence the votes of both Houses. The Peers will obey the Government just as much as the Commons. One House is not any more a check on the other than two horses that are drawing the same carriage and pull in the same direction are a check on each other. That which constitutes the special excellence of the House of Lords in the eyes of the meditative foreigner has fallen into abeyance. But, although this is true, yet it may be observed in the first place that the restraining power of the House of Lords, although under a Conservative Ministry it takes a new shape, is not wholly nullified; and in the second place that the House of Lords has other functions besides that of being a check on the House of Commons -functions, perhaps, of minor importance, but still not to be passed over-and that the exercise of these functions is likely to be most vigorous and profitable when a Conservative Government is in power. straining power of the House of Lords is not altogether asleep, for it restrains in a silent and almost imperceptible way the Ministry itself. When it is said that the House of Lords exercises a restraining power, it is of course meant that this power restrains those affected by it from making changes which the House of Lords thinks dangerous. If there could possibly be a Conservative Covernment that did absolutely nothing, conserved everything and changed nothing, there would be no more reason for the restraining power of the House of Lords to operate during the Session than during the recess. But what is theoretically possible is that a Conservative Government should introduce new legislation of a reactionary character. There is not, we imagine, the remotest chance of the present Government doing anything of the kind; but even if it did wish to do so, it could not leave the House of Lords out of its reckoning. A party vote would support the Ministry if a party vote were asked for, but there would be a considerable pressure put on the Ministry not to strain the loyalty of the Peers too far. Conservative Governments are not likely to last for over; and the Peers would be quite prudent enough to foresee that their position hereafter would be almost untenable if, after having shown themselves mere partisans, they attempted again to exercise their restraining power.

Among the minor functions of the House of Lords is that of being a centre of debate and of original legislation. Here the existence of a Conservative Government is in favour of the House of Lords. Half the Cabinet is composed of peers. This in itself is not saying much. The offices that are held by six peers in the present Ministry hap-pen to have been also held by six peers in the last Ministry. But peers who are Ministers are in a very different position according as they know themselves to command, or not to command, a majority in the House of Lords. Liberal Minister addresses the House of Lords, be has to think all the time how to make what he says go down tolerably well with an adverse audience. He has to be tolerably well with an adverse audience. He has to be bland, adroit, deprecatory. He has to paint the Government as not quite so had as it is thought to be. If it can but be managed, he wishes to shirk anything like real debate. If he can but go away to dinner with the conviction that the report in the next day's papers will end with "Tho "conversation then dropped," he is a happy and successful man. He has got himself and his friends well out of the scrape of a discussion. With a Conservative Ministry everything will be different. If there is a debate in this ensuing Session on Foreign Affairs or India there will be a real delate. The Government will not wish to have a parade of idle talk in the Lords, and to save all real discussion for the Commons. They are as strong in one House as in the other, and they may as well have a debate ange for all where a debate will be most effectual.

nor did it pretend to take any. The Duke of ABGYLL held his tongue as much as possible, and very wisely; for what is the good of talking when any difference of opinion, if pressed to a vote, must end in a defeat? Now things will be very different. Lord Salisbury will state the policy of the Government with openness and decision, for he will know that he is addressing an assembly that will support him. But he will also know that he will be subject to the criticism of able and competent critics. He will have to speak in the presence of the Duke of Argyll and of Lord LAWRENCE, and will have to defend by serious arguments whatever he proposes. In the same way, when original legislation is begun in the Lords, the Government will be as much at liberty to propose what it really thinks best as if it first brought forward the measure in the Commons. Lord CAIRNS, for example, if he wishes to try his hand at Law Reform, will be able to offer as bold and large a scheme as he thinks ought really to pass. Lord SELBORNE had to play a much humbler part. He had either to ascertain previously from Lord CAIRNS what he might say, or he had to run a risk and wait with breathless anxiety to know whother Lord Cairns would condescend to patronize him heartily, or would merely damn him with faint praise. On the other hand, Lord Selbonne will now be able to offer unfettered criticism. He will be able to argue, to point out defects, to suggest improvements; whereas Lord CAIRNS was above such modest work, and merely said that he could or could not recommend their Lordships to concur in the views of his noble and learned friend. That the House of Lords contains many men of the first rank in all the requisites of good debate is notorious; but it is obvious that debates are spoilt when those who propose anything are always on their guard lest those who are on the other side should be piqued into using their unquestionable superiority in voting power, while those who oppose either fear to use their majority, and so are willing to let the debate degenerate into mere decorous talk, or else mean to use their majority, but consider it polite and discreet rather to give a hint in time of their intentions, which they know will sufficient, than to lot matters come to a vote preceded by serious discussion.

Another of the functions of the House of Lords is to criticize, amend, and correct the legislation of the House of Commons, not with the view of stopping the progress of a measure or changing its character, but merely with the view of securing that when a Bill becomes an Act of Parliament it shall be intelligible, consistent, and operative. Unfortunately, though the House of Peers always recognizes that this is a duty which it ought to discharge, and though some peers, among whom Lord Salisbury has been conspicuous, have earnestly set themselves to work to effect what they knew ought to be done, the revising function of the House has proved least officacious when it was most proved. needed. During the tenure of power by the late Ministry, Act after Act was passed which was a mere mass of confusion. Clauses meant anything or nothing. Judges declared that the Act was a simple mystery to them. Local authorities had duties imposed on them which no one could understand. The House of Lords would have been perfectly willing and able to make some sort of sense out of this heap of nonsense, but it was not allowed to do so. It had no time given it for the work. The Government with its time given it for the work. indomitable energy was always doing something, proposing something, carrying something. It always pressed the Lords with the argument that the time of the Commons was not to be thrown away and a Bill rejected for a few technical errors when this Bill had taxed the patience of the House of Commons for many weary afternoons and many still more weary nights. It might be true that some clauses were obscure, others superfluous, and others contradictory, but there could be an Amending Act the next Session, or, if that would not suffice, an Amendment Act of the Amending Act the Session after; but it was intolerable that an indefatigable and popular Ministry should get to the end of the Session and not be able to count the Bill as one of its triumphs. The Lords, discouraged and disheartened, and alive to the painful fact that, if they once began to put the Government Bill into decent shape, there would be no ond to the task, desisted from what they thought a useless effort, and let the Bills go forward anything their imperfections. There ought to be a great change in all this now. The Conservatives do not propose to shine by the mere amount and hurry of their legislation. They can afford to have their Bills properly drawn, properly discussed, and properly revised. If errors

in language or in the framework of clauses are pointed out by acute opponents, they will have no reason to refuse any help they can get in making their Bills as good as pos Whatever the Government may be, those Bills which excite most popular attention must be begun in the Commons, must there be discussed in Committee, and must there receive those singular alterations which, in the heat of petty struggles or the languor of exhaustion, Colemittees are sure to impose. But when such Bills coine to the Lords, there will be leisure to revise them, and a willingness to accept suggestions for revision from every quarter when the reputation of the Ministry is no longer made to depend on the mere number of the Bills it gets That the Conservatives can hold office without through. proposing some measures of considerable importance is impossible. They have complained of the excess of recent legislation, but they cannot afford to go into an extreme the other way. Nor is it possible that the subjects they take up should be such as it is practicable to deal with by Bills simply conceived and easily drawn. All questions, for example, relating to local government and finance, and to changes in the form and administration of the law, briefly with time differential and definition of the law, bristle with tiny difficulties, and demand great skill and knowledge in those who profess to settle them by a new Bill. The present Government can afford to deal with such subjects cautiously, thoroughly, and minutely. will know that its time will not be wasted. Last Session Mr. STANSFELD spent weeks in getting his Rating Bill through Committee in the Commons, and then the Lords undid all his work in half an hour. Such a catastrophe cannot befall the present Government. They will be under no necessity of pushing forward five Bills in the hope that three may survive. There is no doubt that this is a great advantage both to them and to the country; and, with a start so favourable, it must be owing merely to their own negligence or want of capacity if their Bills are not much superior in the details of drafting to those of the Ministry they have displaced.

THE OPPOSITION.

THE Opposition cannot denne their position and Gladstone's intentions are clearly ascertained. The THE Opposition cannot define their position until Mr. rumour that his present purpose is to attend only occasionally in the House is probably well-founded; but circumstances will soon compel him either to renounce or to assert his position at the head of his party. If he continues to act as leader, he will either determine at his choice the policy of his party or provoke some of his adherents to renounce their allegiance. For some time past it has been generally believed that scarcely any of his colleagues influenced his decisions, although they may have been loyally disposed to obey his guidance. Nearly every member of the late Cabinet was surprised by the dissolution, nor is it certain that any one of its members was consulted before the Prime Minister's resolution was formed. In Opposition Mr. GLADSTONE would act not less independently of his diminished band of adherents; and, if they wished to preserve any cohesion among themselves, they would have no choice but to follow the leader who has no possible competitor in the Liberal party. Mr. GLADSTONE'S qualities and defects are perhaps not well suited to the task of retrieving a political defeat. He opposed Lord PALMERSTON in the height of his popularity with a passionate vehemence which seemed to indicate personal prejudice, though it rather proceeded from political incompatibility of temper with the Prime Minister, and from intellectual antagonism to the Chancellor of the Exchequer. During Lord DERBY'S last Administration, which was continued by Mr. DISRAELI, Mr. GLADSTONE enjoyed the pleasure of moulding the legislation of a hostile Government. He may perhaps now be inclined to oppose Mr. DISRAELI in a candid spirit which will be sincere if it is displayed, for Mr. GLADSTONE is incapable of affecting candour. His temporary or final retirement, though it would involve a heavy loss to his party, would be more easily endured at present than on any other occasion. It is obviously for the interest of the Opposition to offer no active obstruction to the Government; and the daring pilot in extremity is probably unfit for a calm. It is more possible to dispense with a leader during a period of inaction than to organize anarchical hostilities. There will be scarcely any possibility of debate on the Estimates of the year, which must have been nearly completed in the various offices before the change of

Government. Mr. Hard and Mr. Ward Hurr will undoubtedly accept the calculations of their predecessors, reserving to themselves the right of introducing in a subsequent year any changes which they may think expedient. The Budget will present greater difficulty; nor is it impossible that Sir Starvord Nobelecter may be compelled to engage in an unequal seembat; but the premature disclosures of the Greenwij address have impaired for the time Mr. Gladstone's infancial authority. It will probably appear that Mr. Disraell was justified in describing the promised surplus as speculative, for it is well known that the revenue has declined since the beginning of the year. The Customs' receipts have been injuriously affected by Mr. Gladstone's improper announcement of his intention of reducing duties, and there is reason to fear that the tide of commercial prosperity has passed the highest point of flood. Sir Stafford Northcots will probably not hold himself bound by Mr. Disraell's hasty declaration that no indirect taxes ought to be abolished, although they may sometimes be properly reduced. The first duty of the Chancellor of the Excheques is to correct the bad effects of recent errors by resolutely determining to administer his department without reference to political considerations.

The expediency of watching and waiting will be evident to all Liberals who are not blinded by passion and disappointment. It is not to be expected that the Government will, during the present year, propose any ambitious legislation. It is always understood that autumn is the time for elaborating the measures which are to be introduced in the following Session; and the entire recess, after a reasonable deduction for rest and recreation, is not too long for the purpose. The present Ministers had until the last days of January no reason to suppose that their early accession was possible, and the elections were far advanced before it was cortain that Mr. GLADSTONE had consummated his political suicide. The adjustment of local taxation to which the party imprudently pledged itself in Opposition may be reasonably deferred until the Government has time to study the details. Sir Massey Lores has judiciously been placed at the Admiralty, where he will have no opportunity of doing further mischief to the cause of his landowning clients. By completing his Cabinet without the admission into the inner circle of a President of the Local Government Board, Mr. DISRAELI has already proved that the Opposition jingle of sanitas sanitatum is not to regulate the policy of his Government. If, notwithstauding the shortness of time allowed for consideration, the Government proposes a Rating Bill, Mr. Goschen and Mr. Spansfeld will not fail to avail themselves of the opportunity of criticism. In this branch of legislation also Mr. Instable may distinguish himself from his predecessors by boking exclusively to justice in the distribution of burdens, instead of attempting to make mischief between different classes of the community. Mr. Goschen and Mr. Gladstone himself could not resist the temptation of assuring the landowners, as Portia told Shylock, that, since Sir MASSEY LOPES had inflicted a defeat on the Government, his supporters should have justice more than they desired. was useless to attempt to calm their virtuous indignation by reminding them that taxes are imposed for the purpose of raising money, and not for objects of political retaliation. Mr. STANSFELD went so far as to threaten the House of Lords with suppression because a hasty Bill sent up at the close of the Session had been rejected as inopportune without discussion of its merits.

If the Opposition is temperate and prudent, the causes which ordinarily tend to weaken Governments will not fail to produce their natural results. Mr. DISEALLI and his colleagues will make mistakes, and they will still more certainly inflict disappointments. At the same time, the multiform irritation which determined the election will with the lapse of time gradually become fainter. Mr. Gladstone's reputation will survive the memory of his errors of judgment and temper; and if unfortunately, a period of commercial depression should occur, popular uneasiness will take the form of discontent with the Government. The question of local taxation might have been connected by injudicious Conservatives; but in a future Session it will be impossible to decline the task of readjustment, with the inevitable consequence of producing much disastisfaction. The difficulty of the Government will be the opportunity of the Opposition; and it will be the fault of the managers of the party if they fail to recover some of the ground which they have lost. Before any serious party contest takes place, it

will be necessary either to induce Mr. GLADSTONE to remain at his post or to select a success When the Co party separated from its chiefs in 1846, the Opposition for some time after the formation of Lord John Russell's Government tried the experiment of dispensing with a regular leader. Mr. DISRAELI, who virtually directed the councils of the party, had not then attained the political rank which would have qualified him to become the ostousible successor of PEEL, and he was anxiously looking for a king under whom he might act as regent, when the name of Lord George Bestinck was casually suggested, and was accepted by the prominent members of the party. In the interval the Ministers themselves had privately pointed out to the Opposition the grave inconvenience which followed a departure from the established mode of conducting Parliamentary business. It is possible that during the present Session the post might be left in abeyance; but if Mr. GLADSTONE declines to act, it will be convenient to fill the vacancy at once. It is not improbable that the choice may fall on Lord HARTINGTON. After the death of Lord Dersy and the resignation of Lord CAIRNS, the majority in the House of Lords appointed the Duke of RICHMOND leader, for the express reason that he was of secondary rank as a politician. Lord DERBY and Lord Salisbury might perhaps have been rivals to one another, but both were content to prefer a judicious magnate whose prefensions could not conflict with their own. Lord HARTINGTON is said to possess a calm judgment and sound political fore-sight; and it is still more certain that he is the heir of one of the greatest and most generally respected of English families. The personal vanity of a statesman may possibly be irritated by the suggestion that another candidate for the leadership of the party is abler or discrector than himself; but no man's feelings are hurt by the consciousness that he is not the eldest son of a duke. Among the numerous advantages of an aristocratic form of secrety is the facility which it provides for conciliating envy and joulousy. Half the public business of England is transacted by gentlemen because they are peers or sons of peers, while commoners of similar qualities might probably be superseded, as in the United States, by demagogues and corrupt adventurers.

GERMANY AND ALSACE.

MIE protest of the Alsatian deputies against the incorporation of their country with the German Empire will excite mirth or melancholy according to the view taken of the morality of the Treaty of Frankfort. Those who see in the dismemberment of France the natural and deserved punishment of her folly in declaring war will dismiss the action of the deputies as a mere outburst of childish irritation at an arrangement by which they are for the present unavoidably sufferers. Those who regret that the German Government should once more have asserted the naked right of conquest, and furnished Frenchmen with an outward and visible symbol which must keep alive the memory of their defeat, will see in the incident of last week only the first appearance of a European difficulty which may in the end be as prolific of disturbance as Poland or Venetia has been in times past. Fifteen years ago it would have seemed incredible that Herr TEUTSCH's denunciation of the abuse of power which has led to the forcible annexation by Germany of a million and a half of Frenchmen should not by this time have become an accepted commonplace. When the doctrine of nationalty was fashionable few persons would have denied that, "if "a country very much against its will is torn from one "nation and added to another," it is thereby reduced to "a state of moral slavery," or that "a treaty by which "rational beings are made over to a new master against their will is contrary to the laws of nature and equity, "and ought not to be regarded as binding upon those who have not approved it." Now the "prolonged language" which greeted these sentiments in the German Parliament has probably found an echo in most countries of Europe. Whether civilization can be set down as a gainer by this vice withholds the accustomed tribute from virtue, it is usually a sign of growing self-confidence; and it was some advantage that brute force should think itself bound to profess a hypocritical deference to public opinion. The members of the German Parliament were exceedingly amused when Herr Teursch attributed to Napoleus III. a desire to

save appearances by an appeal to universal suffrage. But it was a real improvement in the vague code of international morality that a sovereign in the position of Napoleon III. should have thought it advisable to save appearances. The plcbiscite which accepted his rule in Nice and Savoy had probably been arranged so as to secure the desired result, but it could not have been so arranged had there been any very strong feeling of antagonism on the part of the voters. No manipulation could secure a vote in favour of annexation from the people of Alsace or Lorraine. To have to say Yes or No in answer to a question may not give the electors any very large freedom of action, but it puts them at all events in a better position than if the very form of asking their opinion is omitted.

One part of Herr Teurson's speech had been confirmed by anticipation a few days before. "You deem yourselves "obliged," he told the German Parliament, "to go on "arming, thereby forcing the whole world to follow your "example and arm likewise. Instead of inaugurating an " era of peace, you have opened an era of warfare, and now "have nothing to expect but fresh campaigns and fresh "lists of dead and wounded." Coming from a representative of the conquered nation, this might have been dismissed as an empty monace, striving to disguise itself as a prophecy. But Count Molfke has said the same thing in greater detail. He also has warned his countrymen that Germany will be obliged to protect for fifty years what it took her but five months to gain. Everywhere, he tells them in plain words, they will find nations haunted with the belief that Germany is likely to become a disagreeable neighbour. Belgium contains a strong French party. Holland has begun to repair the sluices by which the country can, in case of need, be laid under water. Denmark is building new fortresses. England now talks about invasion from Germany as she once talked about invasion from France. Count MOLTKE does not propose to do anything to lessen these terrors. On the contrary, he is the mouthpiece of a Government which is apparently determined that none of its neighbours shall be uneasy without cause. The peace establishment of the German army is to be fixed at 401,000 rank and file, and the object of the Government is to get these enormous estimates voted once for all. If Parliament, says Count Moltke, is to discuss the military budget every year, military matters will be kept in a state of constant uncertainty. It seems not unlikely that this frank avowal that the Government desire to deprive the German Parliament of the power of the purse may defeat its own end, and that the Committee to which the Army Bill has been referred may insist on limiting its duration to five or ten years. But the control which would thus be reserved to Parliament would be of an exceedingly shadowy nature. Whother the Germans like it or not, they must make whatever sacrifices the Government assert to be necessary for the security of the Empire. Nor can it be said with any certainty that the sacrifices now demanded are in excess of the requirements of the situation. For a generation, at all events, Germany must expect to hold her now possessions at the sword's point. Count Moltki would doubtless maintain that even if no French territory had been taken, the desire of the nation for rovenge would have been equally keen, while the possession of the provinces they had lost would have enabled them to attack Germany with greater effect. This may seem to many persons a more probable result than Herr Teursen's assurance that, if Gormany had contented herself with an indemnity, a war with France would have become impossible. But, whichever of the two is the more like the truth, there can be little question that since the annexation of Alsace and Lorraine anything like a genuine good understanding between France and Gormany has become impossible. How long it will remain impossible will depend in a great measure on the feeling of the people of the conquered provinces. What may be called the selfish element in the desire to regain them is capable of being subdued by such considerations as the inevitable cost and the nucertain result of the war by which alone this object can be accomplished. But the sentimental side of the desire can hardly die out in a high-spirited nation so long as the people of the territory which has been taken away continue to wish for re-union. unity of Italy might have remained a mere aspiration in the minds of the Piedmontese if there had been no strong feel. ing on the part of the people of Lombardy and Venice to give it practical shape and purpose.

The Bishop of STRASBURG appears to have wished to make

the breach between the Alestians and Germany less complete than it had been pointed by Herr Trurson. Perhaps the invalidity of treaties which deal with retional beings without asking their consent struck him as a dangerous doctrine for a Roman Catholic history to admit. Perhaps he was anxious not to imperil future negotiations between the Church and Prince Bismanck by taking up a position of declared hostility on purely politically grounds. Either from these or from other motives he chose to disclaim Herr TEUTSCH'S repudiation of the Treaty of Frankfort, and to amounce in the name of his co-religionists in Alsace and Lorraine that he had no wish to question the validity of a treaty concluded between two of the great Powers of Europe. The Bishop of Strassure had evidently not acquainted himself beforehand with the real feeling of the deputies for whom he claimed to speak. The next day his recognition of the validity of the Treaty of Frankfort was discounsed by another Alsatian member, and the Times' Berlin Correspondent adds that upon this point the Bishop of STRASBURG has not even the support of his brother deputy, the Bishop of Merz. It is not at all improbable that the pure Ultramontanes are getting afmid of being so identified with the Particularist purty with which they have lately been acting as to make it difficult for them to take a line of their own, supposing that the Government should show any disposition to make torms with them separately. If the Bishop of STRASHURG is more Ultramontane than Alsatian, he may look forward to a time when his volunteer acceptance of the Treaty of Frankfort may serve the turn of his party in negotiating for a modification of the new ecclesiastical laws. At present, however, he has only succeeded in alienating his own constituents. Ultramontanes who wish to be popular in Alsace must be Particularists before everything. There are times when even the Roman Catholic Church has to make her choice between the hare and the hounds.

THE BENGAL FAMINE.

ONE day last week the Pall Mall Gazette printed a letter from its Indian Correspondent which seems to describe with remarkable accuracy the process of constructing an Indian telegram for the Times. "These brief "announcements," says the writer, "have always a sub-"stratum of fact, and are usually correct so far as the single "fact which they communicate is concerned. But in a "question so infinitely complicated as the prospects of a "famine, a salient fact, if stated alone, is sure to mislead."
Several illustrations of the way in which these telegrams do mislead are then given. When havest is over, for instance, there is always an enormous body of labourers on the look-out for work, and even in the most prosperous years the news that a canal or a railway was in progress would attract them in vast numbers. If all mention of this normal condition of things is omitted from a telegram, we get only the fact that so many thousand labourers have sought employment on the relief works, and this naturally reads like an anticipation of that famine pressure which it had been predicted would not come till two months later. So with Sir George Campbell's intended resignation. The telegram told us that Sir George CAMPBELL would not be deterred from resignation even by the actual presence of famine. But this does not convey the idea that the one question which the Lieutenant. Governor of Bengal has asked himself or his doctor is how long he can in his present state of health be more useful than a successor would. It is a contest between ability and experience on one side and physical incapacity to make use of that ability and experience on the other side, and whenever this physical incapacity passes a certain point it will be the clear duty of Sir George Campbell to resign, even in the actual presence of famine. It is true the telegram said nothing inconsistent with this idea, but it certainly did not convey it to ordinary readers. So again with Lord Norrherook's abandonment or postponement of the annual migration of the Government to Simla. This fact, communicated by itself, seemed to give quite a new impression of the magnitude of the coming disaster. It would have been very much less suggestive if it had been accompanied by the statement that the FICEROF has all along had doubts as to the propriety of the Government being absent from the capital for eight months of every year, that it was doubtful even last year whether the move would take place, and that the prospect impression of the magnitude of the coming disaster.

of families had only sealled to tuter a scale which was

We have reproduced this stelysis of the telegrams in the Times because they are to the majority of Englishmen the principal source of information as to the progress of the famine, and it is consequently of great importance that their chreater and value should be accurately known. The telegram of last Tuesday contained at least four statements which need to be treated in a similar way. When it is said, for example, that the Government narrative "admits an increase of vagrancy, crime, and child desertion," the first impression conveyed is somehow different from what it would have been if the word had different from what it would have been if the word had been "states" instead of "admits." The former is colourless; it merely tells what the contents of the Government narrative are. The latter seems to imply that the Government has been forced to state this fact, though it would much rather have kept it back. The conchasion which the hasty reader naturally draws is that, if the Government precautions had gone all right, there would have been no vagrancy, crime, or child desortion, and that the fact that they are on the increase shows that the Government has broken down. But these symptoms necessarily accompany great scarcity in all countries. Besides the population which stays at home as long as it can and then goes no further than the nearest relief centre, there will be a minority who have more enterprise, or less confidence in the Government, or who have been brought to distress by idleness or accident some time in advance of their neighbours. This class will supply the increase of vagrants. The approach of distress always turns a certain proportion of semi-criminals into actual criminals, and fills up the gap in the semi-criminal class by new recruits; and when the problem for every one is how to keep body and soul together, child desertion is one of the offences which first present themselves. "It is ascertained," the telegram goes on, "that there have been deaths from sick-"ness caused by starvation." Is this the result, we are tempted to ask, of the Government professions that it would aim at saving every life? But deaths from sickness caused by starvation are very different from deaths by starvation. The moment that the consumption of food falls at all below the amount to which the population are accustomed, sickness caused by starvation may be said to begin. No precaution, however ample in conception or successful in execution, can prevent this. Again, we are told that "Sir George Campbell, doubts whether the "Government can supply enough food"—a melancholy doubt under any circumstances, but still one the significance of which is immensely affected by the precise nature of the doubt. If it means that the Lieutenaut-Governor of Bengal doubts whether the Government has purchased enough food, this is certainly a severe reflection on the policy of the VICEROY. But inasmuch as the VICEROY must have largely depended on the Lieutenant-Governor of BENGAL to fix the quantity of food required, it seems fur more probable that Sir George Campbell, only means that it is doubtful whether the Government will be able to convey enough food to the remoter districts; doubtful, that is to say—as unfortunately it has been all along—whether, in the absence of roads, railways, and rivers, it is possible at three months' notice to organize a complete system of transport. Once more, the statement that "333,000 tons are wanted now, with "coolies to carry 60-lb. loads" seems to suggest that neither the grain nor the coolies are forthcoming, and thus it reads like an aggravation of what is known already. But it may mean no aggravation at all. These figures about represent the Government purchases of rice, and they are probably only "wanted" in the sense that there is no in the sense that there is no reason to suppose that the distress will be less than what the Government has calculated on. It is difficult at a time like this not to regret that the opportunities of misleading the public should have been increased by the invention of the telegraph.

The Vicesor has at length made public his reasons for refusing to prohibit the exportation of rice. In the first place, the greater part of the exports go to feed a population to which rice is almost as much a necessary of life as it is to the people of Bongal themselves. Of 446,000 tons of common rice exported in the year 1872-73—a year in which the export was larger than in any year since 1864—189,000 tons were sent to British Indian ports, including Ceylon, and 160,000 to Mauritins and the West Indies, where the consumers are

mainly coolies. It is natural enough that the natives of Bengal should wish to stave off famine from themself but the Government has to consider other British subjects as well, and may reasonably hesitate before it produces an as well, and may reasonably hemitate before it products an artificial famine in one part of British territory in order to remedy a natural famine in another part. Secondly, one of the main reasons given for prohibiting exports appears to the Vicebox to be really a reason the other way. If all the rice grown in Bengal had been kept in the country prices would have been kept helow their natural level, and but this manner. by this means consumption would have gone on without check at a time when it is desirable to autject it to every possible check that can be applied. In the third place, the existence of an export trade ensures to Bengal the production in ordinary years of more food than is required to meet the home denand, and thus leads to the maintonance of a reserve. It is impossible to say how far even a temperary interference with this trade might not have permanently diverted it into other channels. The only consideration that could have outweighed these arguments would have been uncertainty whether, if exportation continued, there would be enough rice in the country to feed the population. Upon this point Lord Northerock enter-tains no doubt. The Government has imported as much rice as has, on an average of the last five years, been annually exported from Bengal ports to foreign countries, and in this way the supply of food has been maintained without producing scarcity among the coolies in the colonies, or stimulating unnecessary consumption, or risking the infliction of lasting mischief on a most useful trade. Lord Norrherook declares that he has regarded the question "entirely with reference to the present and future food "supplies of the people." He has not wandered into those more general considerations connected with trade and finance which point in the same direction as that in which he has travelled. Even if there is a theoretical answer to his arguments and it is not very easy to suggest one it can hardly be contended that as regards the famine the opposite policy would have made any difference. The rice exported has not come from the distressed districts, but from other parts of the province; and, equally with the imported rice, it would have had to be bought by the Government, and conveyed to the distressed districts. The real pinch of the difficulty would consequently have been just what it is. So far as milways or rivers could have carried it, the rice which has now left Bengal would have found its way to the limit of easy communication, and there have waited until the Government could make arrangements for its further carriage. precisely what has happened now, except that the rue which is stored on the margin of the distressed districts has come from Burmah instead of from other parts of Bengal. The interest of this great conflict between nature and administration now centres in the question of communications. It is to be hoped that the Government of India will shortly give us a detailed statement of what the difficulties on this head really are, and of the measures which have been taken to surmount them.

THE CAMP OF CONLIR.

PIHE French Assembly continues to receive successive parts of the elaborate Report on the proceedings of the Government of National Defence which a special Commission has been charged to present. The part most recently published gives a history of the famous camp of Contie, and the publication of this Report has had a very considerable effect on current politics. It has seriously damaged the reputation of M. Gambetta. At first the feeling of the public, or at least of partisans, ran very high, and it was said that Clambetta was as guilty as Bazane, and that the army of Brittany had been as much thrown away to serve secret political purposes as the army of Metz. The parallel does not hold good for a momant. Bazane was a soldier, having only the duties of a soldier to discharge, with a splendid army under his command. Clambetta was an audacious civilian who persuaded France that he could save her, although she was on the brink of ruin, if he had the exclusive control of military affairs, as to which he was avowedly and necessarily ignorant, and of political affairs, as to which he was a notorious and ardent partisan. He was one of the most credulous victims of that misconception of French history which represents the repulse of the invaders of France in 1793 as due

to the extraordinary energies of the Convention and of the young Republican army. The road to Paris was perfectly open in 1793, after the fall of Valenciennes. The raw Republican levies had been utterly control and the college of the Convention and the college of the college of the Convention and the college of the Convention and the college of routed, and the only reason why the Allies did not go to Paris was that they began to quarrel among themselves. They remained rather to watch each other than to threaten France, and this gave the Generals of the Convention time to form armies with some kind of discipline and coherence. In the legends of the French Republican party the early history of the armics of 1793 has been forgotten, and nothing could have been more sincere than the conviction of GAMBETTA that France could be saved by the Republic, and could be saved by nothing else. But the days of 1870 were not like the days of 1793. Soldiers and money were not to be got by mere terror. If Frenchmen were to fight, they must be persuaded to fight, and therefore there was supposed to be a truce to all party differences, and every one was asked to do his utmost. CAMBETTA saw this, and acknowledged it, and even to the end of his dictatorship there were traces of his art having a him for the control of the control of his dictatorship. there were traces of his not having wholly forgotten it. But, on the other hand, his real belief was that the Republic was the magical force to which the victory in which he firmly believed would be really due. He was surrounded by furious partisans, some of a very bad type; he had friends to serve, and he was by no means scrupulous as to the way in which he served them, or let them help themselves. He is generally believed in France to have profited in no inconsiderable degree by the opportunities which his position How far the accusation is well founded no afforded him. one can pretend to say; but when an estimate is being formed of the political prospects of a man who was at one time looked on as the coming leader of the Liberal party, it is impossible to leave a belief so general out of the computation. But what is more important is that his whole policy is now distrusted and discarded. His system of hurling raw levies against regular troops is recognized as fundamentally wrong. The magical name of the Republic has been shown to have no magic in it. There can be little question that he did not treat his political opponents fairly, and that, although he invited all to join the struggle, he wished victory to turn to the exclusive profit of his party; and it is because the history of the camp of Conlie brings all his faults into strong relief that its publication has become a matter of serious importance. At the same time it must never be forgotten that the resistance of France after the fall of Metz, a resistance of which the French were at the time justly proud, was almost entirely due to him. It was GAMBETTA who never despaired, and thought that the war might go on satisfactorily even after the capitulation of Paris. It was he who disregarded the remonstrances of the generals who complained that they were required to perform what was impossible; and even in the depositions of hostile witnesses there are many signs of the admiration excited by his inexhaustible energy, and by his profound belief in the great results that must be obtained if the country would but persevere in the efforts which he called on it to make.

At the end of the third week of October, 1870, M. DE KERATRY proposed to CAMBETTA to form an army in Brittany, of which he should be the general, that this army should be a distinct force, and that its object should be to introduce supplies into Paris from the west along the right bank of the Seine. This was the famous plan of Troche, and Trocur's plan was known to Keratry, who had recently left Paris. In order to make his army worthy of the name, Keratry asked for an admixture of regular troops, a supply of officers, of artillery and cavalry, and of Chassepots or some other arms of precision for his men. CLAMBETTA approved the project, and promised everything that was asked. Kerater went off to Brittany and appealed energetically and successfully to the patriotism of the province. He had to invite men to join in the enterprise who were totally strange to military life and little fitted to endure its privations and fatigues-men in business, to endure its privations and intigues—men in business, fathers of families, peasants of mature years absorbed in their hard struggle for existence. But the Bretons answered to the call, and, first and last, fifty thousand men joined the standards, if there were any standards, of this unfortunate army. The departments from which these levies were drawn were ordered to furnish supplies and they observed the order so that the monplies, and they obeyed the order, so that the men, although in the depths of misery from other causes, were not short of food.

Unfortunately Keratev shared what the framer of the Report cells GAMBETTA'S mania for camps, and he pitched on a site for his camp at Conlie, which was about as had a choice as could have been made. It had no military value, as it did not command the roads by which an invading army would approach, and the nature of the soil was such that when the rain came the men had literally to live in a sea of mud. The promises of Gambetra were soon discovered to have melted into air. Instead of artillery, the army of Brittany got can Eh, but no horses or harness. Instead of an admixture of regular troops and the support of cavalry, it got a few Breton Mobiles and a few Lancers. Instead of an adequate supply of officers, it got seven, while officers of Marine who were anxious to join were not allowed to do so. Lastly, and above all, instead of 30,000 guns of a modern type, it got about eight thousand of different patterns. The army of Brittany was never really armed at all, and it is this that forms the main basis of complaint against the Government of GAMBETTA. What the framer of the Report considers as established by the evidence is that GAMBETTA had the guns to give, but would not give them; that, on the urgent remonstrances of KERATRY, he gave an order that any guns in store in certain towns of the West should be given up to be used by the army of Brittany, and at the same time telegraphed that not a single arm was to be given up without the special permission of the central authority; and, lastly, that the army of Brittany was thus sacrifical and the sacrification of the central authority; ficed simply because it was an army of Brittany, and CIAMBETTA feared lest it might become an instrument in the hands of his political opponents. Towards the end of November, the destination and character of the army of Brittany were suddenly changed. GAMBETTA first called off those of the men who had arms of some sort to go to the defence of Mans, which was threatened by the enemy; then he issued to the army a violent Republican proclamation, telling the indignant Bretons that the fortunes of France and of the Republic were inseparable; and, lastly, he put the unarmed remainder of the army and KERATRY himself under the orders of another general. Keratry was extremely indignant at this treatment, and at once resigned, alleging that what was now being done with his army was completely at variance with what had been agreed on. There was no doubt as to this; but then many other things had changed too. It was impossible, with the Germans advancing on Mans, to keep up the fiction of a special army destined to revictual Paris. All the men that could be get were wanted to defend the West, and among those that could be got were the troops of KERATRY. That they should have been left unarmed, if it is true that they could have been armed, and that the guns, as the Report states, were actually there, but the troops were not allowed to get them, was an atrocious betrayal of the confidence which the Bretons had reposed in the Government. It may be observed, however, that the framer of the Report only arrives at the conclusion that the guns existed by an elaborate calculation based on the supplies brought by sea to Brest and Havre during two months, and that it is very difficult to prove in this way that the guns were there, that GAMBETTA knew they were there, and yet wilfully for political objects broke his promises. But when it is conceded that the men were not properly armed, the change in the destination of the army of Brittany was not the fault of the Government, but was made necessary by the changing circumstances of the country.

After Kérathy gave up his command, the troops he had gathered together had as bad a time as troops could well have who were cut to pieces or made prisoners by the enemy. They were kept for some time at Conlie in spite of the urgent remonstrances of their new commander, and still they could learn nothing of the business of war, as soldiers cannot well be drilled on ground where they sink up to their knees in mud, and they could get no practice with guns, as they had no guns to fire with. Still they were kept at Conlie, partly, as it is suggested, because Gambetta did not like to own that his great plan of placing his levies in camps had in this instance proved a failure, and partly because he was told, and believed, that if the men were allowed to disperse they would go to their homes and spread the dangerous rumour that they had been betrayed by the Republican Government. At last, in January, they really got some guns which had come from America, and had been originally intended for the civil war in the States. But these guns were almost useless; they were rusty, had never been properly finished, and were without the necessary appliances for making them effective. Armed in this manner, without above, with their clothes

perished through exposure to wet and mud, most were sent to fight under CHARZY, while the rest were charged to remain and defend one of the more important of the positions of Conlie. It was in vain that the commander who had replaced Kerater protested that to lead troops in such a condition to face the Germans was to court an inevitable disaster. Weither Gamberra nor Chanzy would listen to any remonstrances. The war was at an end if nothing was done by the armies that still existed, and these miserable Bretons might at least be used to keep the war going on. The natural result followed. The troops that had endured so much at Conlie to so little purpose were totally useless in the field and although they defended the position at Conlie assigned to them while they had any ammunition, they were soon at the end of their resources, and had to get away as best they could. There can be no doubt that they were very badly treated, and it is not surprising that their indignation should now be directed chiefly against GAMBETTA. He no doubt promised more than he performed; he engaged to give guns, and he did not give them; he was told that the men were rotting off uselessly at Conlic, and for a long time he would take no heed. If he did not sacrifice the Breton troops because they were Bretons, he certainly had other troops of whose political principles he more approved, and whom he favoured in the distribution of arms. But the time when justice, and no more than justice, will be done to GAMBETTA is not yet come. If proper contracts had been made in a proper way, if the troops had been well armed and well drilled before being led into the field, if the advice of experienced generals had been taken and followed, the consequence would simply have been that the war would not have gone on at all in the provinces after the fate of Metz. It was because the task of continuing the war was confided to an ignorant audacious civilian, who made very bad contracts through very bad agents, who insisted on his generals fighting, who put together raw troops in camps and kept them there, and who honestly believed that the name of the Republic had a magical force in it, that the war was protracted in the provinces till Paris capitulated. A man in such a position must necessarily commit so many faults that it may almost be said that the discovery of his faults does not damage him. The story of the camp of Conlie is impor-tant, not so much because it shows what just reasons of complaint many Bretons may have against GAMBETTA, as because it shows that the system on which he worked could not lead to success. If there is to be a Republic in France, it must, in short, be something clse than a Republic which believes that it can live by the expenditure of revolutionary energy. It must be a Republic trusting to regular administration, regular troops, regular diplomacy and finance; and in proportion as this is realized, the political importance of GAMBETTA becomes less, and may soon vanish altogether.

THE RAILWAY TERROR:

IT is impossible to imagine any line of policy more deeply injurious both to the temporary and the permanent interests of railway shareholders than that which is at present being pursued with strange perversity by their official representatives. During the last six months there has been a constant succession of terrible accidents. At least a hundred and twenty passengers have been killed and nearly a thousand injured, and it is probable that these numbers fall very far short of the full measure of destruction. Moreover, accidents continue to be of almost daily occurrence, and there seems to be every reason to anticipate that even the unprecedented slaughter of last year may be exceeded in the present year. It is not surprising that, under these circumstances, something like a panic should have seized a considerable body of the public with regard to the perils of railway travelling, and this panic is evidently increasing. Every one must have observed symptoms of it in private society. There are now few people who enter a train for a long journey without uncomfortable misgivings, and there would appear to be many who have resolved not to use the railway at all except when it is absolutely necessary. Last year a great deal of the traffic between London and Edinburgh was driven into the steamboats, and next season the desertion from the railways will no doubt be on a larger scale. It is of course impossible to give up railway travelling altogether, and it would be absurd to suppose that trains are likely to

find the consequences of the present reign of terror un-pleasantly indicated in declining passenger returns. It might have been expected that at such a time the managers of the railways would have endeavoured to do what they could to appease popular indignation and to allay alarm.

Instead of this, however, they seem to think that they can browbeat the public into abject submission by assuring them that relivery accidents are inspitable, and want in the contract the contract of the contract that railway accidents are inevitable, and must just be accepted as a matter of course. There is an old story of a Highland cattle-stealer who was disposed to show fight at the scaffold being urged by his wife "to gang up and be hangit "to please the laird"; and the Railway Chairmen in a similar spirit protest against the indecent resistance of railway passengers to an qualterable decree for their execution. If the Railway Chairmen, in their replies to the recent Circular of the Board of Trade, had only said, "Well, we admit that "all these accidents are very distressing, and we are very "sorry for them, and hope soon to be able to make "arrangements for obtaining increased security on our "lines; we are doing what we can last we cannot be appeared." "lines; we are doing what we can, but we cannot do every"thing all at once," there would have been a disposition
to forget the past in hopefulness for the future. But,
no; the Chairmen hold out no prospect of improvement. They are indeed spending money on various contrivances recommended by the Board of Trade, but when these are in use accidents will, they tell us, occur just the same as at present, except that they will probably occur rather more frequently in consequence of the impaired caution and discretion of guards and engine-drivers through blind reliance on mechanical assistance. Some of the Chairmen have even gone so far as to say that it is absurd to make such a fuss about the number of people who have lately been killed on the lines, inasmuch as it is only an apparent increase due to a new way of making up the returns, and that, in point of fact, a great many more lives have been taken every year than the public had any idea of. This is certainly strange comfort, and it is not surprising that it should have had rather an exasperating than a soothing effect.

It may be doubted whether it is desirable that a public office like the Board of Trude should allow itself to be drawn into a controversial correspondence with any body of traders or speculators. The President of the Board gave the Companies fair warning that, if they did not mend their ways, it would be necessary to try the effect of a little penal or coercive legislation. The Companies have made their replies, and if these replies are not satisfactory, the natural and dignified course is, not to enter into an idle controversy, but to proceed at once to propose such legislation as may be required. Mr. MALCOLM'S Report is addressed to his official chief, and not to the Companies, but it will be apt to provoke rejoinders from the latter, which, in turn, may have to be answered. Mr. Maloolm has no difficulty in showing how irrelevant and inconclusive are the pleas of the Railway Chairmen, and he might in some respects have made the case against them even stronger. It is obvious that the statistics of killing and maining are quite beside the question, which is not how many persons the railways shall be allowed to kill and maim in a year, but how many they can, by reasonable and necessary procautions, avoid killing and maining. Apart from this, however, the statistics are imperfect and misleading. The Companies furnish the returns themselves, and they are not too caroful to ascertain all the casualties that occur, while they exercise their own discretion as to whether the injured persons are not themselves responsible for what has befallen them. The ideas of railway officials on this point may be gathered from the fact that a passenger who jumped out of a train which had just been thrown off the rails, and a woman who was killed by an unexpected train in the middle of a line on which she had been turned out on a dark night at a distance from a station, were both entered as having been killed through their own fault.

One of the chief points in the defence of the Railway Companies is that they have lately spent considerable sums on new works; but it turns out on inquiry that the new works have usually been erected because they were required to enable the Companies to extend their business, and not for the safety of the public. New sidings to the extent of 147 miles are, after all, a very small matter for a Company which, like the North-Eastern, has in a few years doubled its passenger traffic and increased its gross receipts thirty per cent. Only a very small part of the North-Eastern system is worked on the block system; safety-points are wanting in about half the places where they ought to be;

and interlocking arrangements such as the Board of Trade considers indispensable have been provided in only 886 cases out of 2,399. The Great Western takes credit for having substituted the narrow for the broad gauge over a considerable part of its system, but the narrow gauge is a commercial advantage for the Company and more dangerous for travellers. In regard to interlocking, safety-points, and the block telegraph, the Great Western is extremely defective. Still it is a poor Company, and the rich Companies, the North-Western, Lancashire and Yorkshire, and North-Eastern, are almost as bad, their culpability being greater in proportion to their means. From Captain Tylen's Report on a recent accident at Bolton, on the Laucashire and York. shire, it appears that the signal cabins at this point are twenty years old, and the appliances connected with them are in keeping with their decayed and tumbledown condition. The accommodation at the Bolton station on one dition. The accommodation at the Bolton station on one side of the tunnel, and at the sidings on the other side, is "quite insufficient" for the traffic. Some of the trains are timed to leave within two or three minutes of one another, in violation of the printed rule of the Company that they should be kept at least five minutes apart. Goods trains are sent on in front of passenger trains simply because there is no room for them in the station, and they cannot be shunted at three on the other are left shunting or waiting to shunt or three on the other are left shunting, or waiting to shunt or pass the sidings, and must be sent on as fast as possible, just because it is absolutely necessary to got rid of them. There are stations on the London and North-Western which are in every way as bad. Nothing, for instance, can be more disgraceful than the condition of such important junctions as Wigan and Crewe, as disclosed in recent inquiries; and Colonel Hurchinson has reported that the accident at Adderley Park the other day was due to the want of sufficient siding-room which necessitated the occupation of the main line by two goods trains and a light engine at the very moment when the express was due. Moreover, there should have been a fog signalman where of course there was not one; and this part of the line is not worked on the block system. Yet the Chairman of this Company, with Wigan and other massacres in fresh recollection, has the effrontery to assert at his half-yearly meeting that a man is safer on the North-Western Railway than at his own fireside. The North-Western, the Lancashire and Yorkshire, and the North-Eastern are among the most flourishing railways in the country, and yet they deliborately starve their lines and kill their passengers by the neglect of obvious precautions.

Another argument of the Railway Chairmen is, as we have before pointed out, quite childish in its simplicity. At the same time that they take credit for the gradual introduction of various checks and precautions, they point out that these contrivances must necessarily demoralize the working staff by leading them to rely too confidently on this assistance, and thus impairing their vigilance and cantion. If this is a correct view, of course the Companies in making these changes are wilfully endangering the lives of their passengers; but there is no reason to suppose that it is a correct view. Nothing makes men so reckless and desperate as being surrounded by dangers of all kinds without anything to help them except their own discretion. But oven supposing that these new contrivances do to some extent produce the effect ascribed to them, it can hardly be doubted that the risks thus created are infinitely fewer than the risks to which the working of the line would be otherwise exposed. No bad accident has yet occurred through the block system, and many very bad yet occurred through the block system, and many very accidents, as, for instance, that at Kirtlebridge, have occurred from the want of it; and the same remark applies to interlocking apparatus. Moreover, when the block to interlocking apparatus. Moreover, when the block system is established on a line, the driver has a right to trust to it; and, if there is an accident, it is not his fault, but the fault of the Directors, who make a pretence of blocking the line while, in point of fact, trains are allowed to acramble through haphazard. The safety of travellers should be the first object of the Railway Companies; but it is not the first object, nor the second. Before it comes the aharoholders dividend, and before that comes the multitude of side speculations in which Chairmen and Directors are personally engaged, and to suit which the lines are in many cases really worked.

CARICATURES.

VI HAT are the limits within which caricature is justifiable is a question not altogether easy to be answered. Indeed the problem is one which does not admit of any definite answer. We may say generally that the caricaturist should be guided by generous feeling, and should not interface with the rights of social privacy; but it may eften be fairly doubted whethers, any given case the limits thus implied have or have not been exceeded. Our old caricaturists of the Gillray school often sinned in the direction of want of generosity. They wielded a brutal bludgeon, and thought that any stone was good enough to throw at a political opponent. A man who seventy years ago took a different view of the French Revolution from that of Fitt or Burke was a miscreant for whom no names were too bad, and whose moral deformity would justify any misrepresentation of his personal peculiarities. In that rough old warfare hard enough blows were given and taken on both sides; and we who can look on more calmly are not very much disposed to complain of the result. We are glad to be familiar with the black muzzle and ponderous bulk of Charles Fox and the spindle shanks and ponderous bulk of Charles Fox and the spindle shanks and picturesque by the surviving portraits. In later years a more moderate school of caricaturists has perhaps shown equal power with less brutality. When Puroh made all England familiar with the Roman nose of the Duke of Wellington, or the queer probessis of Lord Brougham, those eminent leaders would have been foolish indeed if they had complained of their volunteer portrait-painters. The ridicule implied was thoroughly good-natured for the most part; and the eccentric shapes of the noses rather endeared their proprietors than otherwise to the bulk of the nation. At the present day some really excellent likenesses are to be found in the same guise, to which no reasonable man would object, and which graphic order.

latterly, however, there have been various signs that a curiosity, legitimate enough in its place, is being pushed to questionable extremes. There is a marked tendency in various directions, not indeed to the old brutality, but to the equal or even greater sin of unjustifiable interference with private life. The practice of publishing a series of articles upon some particular set of distinguished men has become common, and has not always been under the control of good taste. The general public is naturally curious to know something about the usegmates whose names it reads at the heads of speeches, and whom it is desirous to convert into something more than mere names. It wants to see Ministers as they appear to reporters in the gallery, or to fellow-members in the lobby. Having, as a rule, a very short memory, it is also anxious to be reminded of any characteristic facts in their pust career. Some very able, and some not very able, writers undertake to satisfy this curiosity; and we are accordingly often treated to a series of political sketches, or to a gallery of public speakers, or popular preachers, or distinguished advocates, or men of literary eminance. Nothing, again, can be fairer within certain limits. When an actor exhibits himself to anybody who can afford a shilling, he invites public criticism; and a member of Parliament, or even a clergyman or a lawyer, is in his way mounting a popular stage, and may be assumed rather to court than to avoid popularity. Unluckily the public curiosity is rather undiscriminating. It wants to be acquainted with the private as well as the public life of a Minister. It thirsts for the anecdotes which must be derived from his talet as well as for those which could be given by a reporter of his specches. It wants to know how the preacher behaves in his family as well as how he looks in his pulpit. It is not content with criticizing the published works of a great poet, but is anxhous to peop into his correspondence, and thinks itself rather cheated than otherwise if his pr

some danger of transgression.

The process by which one system slides into the other may be illustrated from some well-known caricatures. Some time age a considerable hit was made by some striking portraits which appeared in the pages of our contemporary, Family Fist. Nobely could find fault with the general darge. Mr. Gladstone and Mr. Disraeli are, in a sense, public property. We know their external peculiarities as well as we know those of our own families. We

should at once recognize them in the public streets if we had never seen them before in the flesh, and certainly they would be the last to complain of their notoriety. Nor could it be matter of complaint that a brief sketch of their career should accompant the portraits. Possibly the letterpress might be a little too evere or too complamentary; and here and there we nright fancy that the artist had dwelt too much upon some personal defect. But it would be about to resent a trifung excess of complains in a carrierture or to be over-agacting as to the of emphasis in a carioature, or to be over-exacting as to the accuracy of a criticism on a public man. Gradually, however, it became evident that our contemporary was getting into difficulties. The supply was running short. After all, the number of distinguished men in the country is painfully limited. It cannot be expected that a new leader of thought or politics should make his appearance every week: and therefore a paper which gives a expected that a new leader of thought or pointes should make his appearance every week; and therefore a paper which gives a weekly portrait is very soon forced to draw upon its capital. The list of the people about whom anybody really cares is speedily exhausted; and the question occurs, what is to be done next? A few excursions into the regions of foreign celebrities may eke few excursions into the regions of foreign celebrities may eko out the supply for a time; but then the British public takes very little interest in a foreigner of less note than the Pope or Prince Bismarck. The consequence is that the paper must either drop its most distinguishing feature or take to giving likenesses of much less interesting people. We will not ask what would have been the course prescribed by a stern sense of duty; but it is only too clear what has been the course actually adopted. In the dearth of nobler prev, the caricaturists of Vanity Fiar have been compelled to lay hands upon inferior personages who might have flattered themselves that their obscurity would be a sufficient protection. A number of gentlemen have been presented to public notice of whom it may be said without offence that the circle to whom they are known is distinctly limited. The caricaturist has not contented himself with following, but has endeavoured to excite, public himself with following, but has endeavoured to excite, public interest; and probably the distinction marks the limit where the process ceases to be legitimate. Each of these victims has further to be introduced to the public in a brief biographical sketch; and as their careers have frequently been contined to very modest spheres, it follows that details have been given with which it is not very easy to see what right the public has to be acquainted.

Now we do not propose to say anything of the taste exhibited in

these performances, as indeed we hold that in such cases the less said the better; whilst we could hardly produce instances without falling into the fault which we are condemning. We consider the particular case merely as affording a precedent, and a precedent which, if we are not mistaken, has been already initiated. If it is in fact imitated to any extent, as is generally the case with a successful hit, we cannot doubt that it tends to introduce a serious nuisance. We are quite ready to assume that the portraits in Vassity Fair have never been offensive, and that the notices have not erred in the sense of being unduly hostile. We simply object the to a system which invites the general public to contemplate the portrait and road the biography of gentlemen who have never become fair subjects of public criticism. Such a practice must income fair subjects of public criticism. Such a practice must inevitably lead to a breach of good manners. Suppose, for example,
that a gentleman is a good shot, that he is popular in London
society, or known to his friends for a happy taste in cookery, is
that any sufficient reason for his portrait being exhibited in all the
print-shops and a sketch of his character being published in a
newspaper? It is impossible that such a sketch should not touch
upon just those subjects upon which the public would have no
right to be informed even if he were tenfold more conspicuous. It is by no means desirable that the world should be invited to inspect even the Prime Minister's stables or dining-room; and what excuse can there be for revealing the domestic life of a gentleman who has no other sphere of action? The practice cannot be carried on without breaking down all the barriers which at present keep the tyranny of public opinion at arm's length. If such a thing is done without the victim's own consent, it is an offence against tyranny of public opinion at arm's length. If such a thing is done without the victim's own consent, it is an offence against privacy which he has a right to resent. So long as a man does nothing to make himself public, publicity should not be thrust upon him. If, on the other hand, he does consent, we can hardly imagine a more undignified proceeding. An English gentleman should surely be not only above advertising the details of his private life in a public newspaper, but above conniving at the advertisement. Perhaps it may be urged in defence that the details given will be all of a complimentary kind, and such, therefore, as a man may he presumed to wish to be known. We do not think that this diminishes the offence. It merely means that the spy is also to be a flunkey. A man is to be induced to commit an undignified action by the promise that it shall be made pleasant for the moment. Who is to give a guarantee that when the system is once established it will not be applied to worse purposes? Can there be a worse plan than to establish this kind of complicity, in virtue of which a man is to be allowed to give himself an indirect puff on the understanding that it shall never be converted into a satire? In bad hands it might even become a means of extortion; and even in the best it is heally favourable to the self-respect of anyledy concerned. It is essential to caricatures that the authors should at least be independent; and any suspicion of collusion makes them very questionable performances indeed. It is easy to imagine cases, none of which may have autually occurred, in which the results would be singularly officiative. Oblique flattery bestowed upon unworthy objects is the guile of caricature is as disgusting as standin on respectable objects. We could imagine, for example, a man of whom

the truth could not be spoken without a libel, who was anxious to pull himself into notoriety by any means not demonstrably discreditable. If he is kind enough to allow a portrait to be taken, his volunteer biographer is bound in courtesy to show his gratitude; or, in other words, to give him just the advertisement of which he is in need. If this indeed were all, we could ashinit with telerable equanimity. There is a class of persons who will never be at a less for modes of thrusting themselves upon public attention. The real evil is that the practice tends to set a precedent; and because a vulgar and unscrupulous person is delighted with an estentations exhibition of his private virtues, it may gradually come to be thought fair to demand a similar consistent from some squannish people, to the treats of the "treats." cossion from some squennish people to the tastes of the "numy-headed beast." The least sensitive of mankind make their want of reticence a rule of general practice.

We do not inquire how far the system has been actually abused by its inventors. We only desire to point out that it is very liable to abuse. Caricature is a dangerous weapou, though parfeetly legitimate within its own limits. It is all the more important that those limits should be defined as distinctly as the case permits. As a general, though necessarily a vague, rule, we should say that the caricaturist should be bound to limit himself to public men, and to public men in their public capacity. He should not deal with facts which can only be known to private sequaintances. We should not be in danger of having notes taken on our appearance and manners in our families and at our clubs. We should ance and manners in our mannes and at our ciuffs. We should submit in good temper to the natural consequences of publicity, but not invite it for its own sake; and when we see any caricature which implies by its design that there has been either a breach of confidence or an unworthy concession to unjustifiable curiosity, it is self-condomned. When a man writes in a newspaper an account of some personal infirmity of a distinctivity of universe to him is a point a manufactural. guished man known to him in a private capacity, he is admitted to have offended against the ordinary social code; and the rule should be strictly observed. One suggestion may be added in illustration of the tendencies of such a system. Hitherto we have not observed that ladies have been taken for the subject of these designs. Everybody would feel it to be intolerable that one, for example, of our distinguished feminine authors should be caricatured for public amusement. But how long is the exemption likely to be continued if the general rule be infringed? There are unluckily plenty of women to whom notoriety does not seem to be objectionable. They have no objection to exhibit themselves on platforms, and perhaps would be rather glad to see a tolerably married representation of their represent appearance. It would merciful representation of their personal appearance, then require only one stop to drag before the public ladies upon whom such notoriety would inflict exquisite pain; and though at present such a step would excite general disjust, we are moving so fast in various directions that we cannot regard it as beyond the limits of future possibility.

NON-HEREDITARY PEERS.

WRITER in Blackwood's Magazine, whose notions about the modern principalities of Germany have caused some merriment in another quarter, has also thought good to tell us that the British House of Lords is "the only Senate in the world which is composed exclusively of hereditary peers." The description must at once strike every mind of common accuracy as an inaccurate description. Every one knows that some soats in the House of Lords are not hereditary but official, that some seats are not hereditary but elective. No one can ever have dreamed that a Bishop must be the son or other heir of the Bishop who filled his place before him, and it would be only one degree less wide of the mark to think that a Sootch or Irish representative peer must needs be the son or heir of the representative peer who filled his place before him. The expression, then, is in strictness as insecurate as an expression can be; and yet, like many inaccurate expressions, it contains a kind of half-truth; we can see how the person who uses it came to use it. Our House of Lords is by no means composed exclusively of hereditary peers, but the author is quite right in contrasting our House of Lords with all the other Senates in the world, and in taking the hereditary element in it as the element which gives it its distinctive character. First of all, the hereditary on to their heirs—just as much as those who have inherited their peerages from those who went perore them. Then again, though the seats held by the Scotch and Irish representative peers are, as seats, not hereditary, but elective, yet their helders are chosen out of and by the members of a hereditary class; the hereditary sentiment therefore attaches to them as much as to the helders of those seats which are themselves hereditary. And, though it may sound like a paradox, there is something of an hereditary character which attaches even to the official members of the House. It is not unmon in early documents to find a grant made to an eveloriescommon in early documents to find a grant made to an elementation, a grant which is meant to pass from one lishup or Abbot to his successor, spoken of asheing made "hereditario jum," me less than a grant to a private man which is meant to pass from father to son. And certainly it is no great strotch of ladguage to speak of a man who takes the place of his predecessor sounding to a regular liew, who steps exactly into his place, and

who, in the eye of the law, continues the same corporation sole, as being the heir of that predecessor. He needs only to be named by his predecessor to be in exactly the same position in which a son adopted by will stood, according to Roman law, to his adopted father, the position in which the younger Cassar stood to the elder.

We do not mean that it is at all likely that the writer in Hackwood

thought of this subtlety; he most likely simply forgot that the House of Lords contains Bishops and representative peers. But then he hardly could have forgotten the fact if the Bishops and representative peers had stood out, as something altogether unlike and in-congruous, in strong contrast to the strictly hereditary peers. If there were seventy-two members of either House of Parliament who were marked by some character, or who were appointed in some way, which formed a marked contrast to the rest of the House, it is quito impossible that they should be in this way passed over by any one who undertook to speak of the composition of the House. To turn to the ecclesiastical shadow of Parliament, to the Convocation of Canterbury, we can hardly fancy any one speaking of that body as exclusively official, in the presence of the representatives of chapters and dioceses, or as exclusively representative, in the presence of the Deans and Archdeacons. The truth is that the official and representative members of the House of Lords, though their seats are not hereditary, have much more in common with those members whose scats are hereditary than they have with the nominated or elected members of other Senates or Upper Houses elsewhere. In the case of the representative peers it is hardly needful to prove this. An Irish or Scotch peer belongs to the same general class as a peer of the United Kingdom. He is so like a peer of the United Kingdom, he enjoys so many of a peer's so like a peer of the United Kingdom, he enjoys so many of a peer's privileges, that it seems a kind of anomaly that he should in any case be denied the highest privilege of all. He is, in fact, a kind of survival, a vestige, like a fossil animal, of a past state of things—of a state of things in which he did enjoy the full privileges of his order in an assembly which has now passed away. But to come back once more to the Bishops, and of course to the Abbots also in the days when there were Abbots. Their seats are not heard the days when the were abbots. hereditary, except in the secondary and obsolete sense of the word. But neither are they nominated in the sense in which the mombers of several French Senates and Houses of Peers have been nominated, nor are they elected in the sense in which the members of the American Senate or the Swiss Standerath are elected. We have said that they are official, and a purely official elected. We have said that they are official, and a purely official seat is something different from a merely personal seat, whether held for life or for a term. If we conceive a perage as attached to an office, the nomination is not made directly to the perage, but to the office which carries the perage with it. And, though this may sound like a subtlety, we suspect that it is really a practical difference. It is the same in the Convocations of the two provinces, where the number of official members is so much greater. The Crown or the Bishop in appointing a Dean, the Bishop in appointing an Archdescon, is in effect amounting a greater. The Orown or the Bishop in appointing a Dean, the Bishop in appointing an Archdoncon, is in effect appointing a member of the Lower House of Convocation. But it is only indirectly that such an appointment is made. The appointment is made primarily to the deanery or archdeacoury; it is made only in quite a secondary way to the seat in Convocation which is an incident of the deanery or archdeaconry. And this is still more true of the Bishops' seats in the House of Lords, now that, except in the case of five select sees, the appointment to a bishopric does not carry with it a peerage, but only the reversion of a peerage. And even the fact that the Crown does not appoint directly to the bishopric, more form as it has become, makes a certain difference between the seats of the Bishops and the seats of purely nominated peers or senators. So far is the Crown from nominating directly to a peerage, that all that it does is to name to the Chapter the person whom the Chapter elects to an office which makes its holder entitled to a peerage, either at once or after a while. In the case of the Abbots, and of the Bishops before the Act of Henry the Distance that this last distinction was stronger still. So far is the Crown from nominating directly to a

Eighth, this last distinction was stronger still.

But, after all, "official" is not the right word to express the position of the Lords Spiritual in an English Parliament. Seats in the House of Lords might be attached to other offices—to judgeships, for instance—but the holders of such seats would not till exactly the same position as is filled by the Bishops. The seats of such judges or other official peers would be purely official; the seats of the Bishops are somewhat different. Bishops and Abbots were not given seats in Parliament, as some people seem to think, because it was well to have some members to look after the affairs of the Church, or because in an unlearned age the Bishops and Abbots were fitter than other men to look after the affairs of the kingdom. Historically, the seats of the Bishops in the House of Lords simply mean that the Bishops, like the Earls, have never lost the original right of every freeman to appear personally in the Great Council of the realm. While other men gradually lost it, they kept it. But the Bishops and Abbots were able to keep it along with the great hereditary nobles because they held estates and temporal powers, and a general temporal position, which enabled them to deep their place while other people lost theirs. They hold an entailed estate, only the estate is not entailed on their children, but on thoir successors, nominated or elected as the law may appoint. The real difference between a spiritual and a temporal holding censists in the order of succession. And in each case the order of succession is a mere creation of the law. People sometimes talk as if the succession to an entailed estate was something in the sternal fitness of things, while the succession to the endow-

ments of an ecclesiastical or other corporation sole is something purely artificial. The truth is that both are equally artificial; one is as much a creation of the law as the other.

is as much a creation of the law as the other.

In this way it may be seen that the expression which has led us into this line of thought, though quite inaccurate, and most likely owing to mere forgetfulness, does in a way set forth a total. We see that the Lords Spiritual, though not hereditary peers in the common sense of the words, still have something in common with the hereditary peers. If "hereditary" is not the right word to express their tenure, "nominated" and "official" are not exactly the right words either. Like most other things in England, it is a tenure which has grown up one hardly knows how, and which is a little anomalous according to any cut and dried theory. In the case of the representative peers the approach to the hereditary, character is much nearer. Their seats are not hereditary, but their qualification for a seat is. But it is rather strange that this qualification should in truth be very much of a disqualification. A Scotch peer cannot sit at all in the House of Commons; an Irish peer cannot sit for an Irish constituency. It follows that a Scotch Liberal peer, that an Irish Roman Catholic peer, is politically the most helpless of mankind. The doors of both Houses of Parliament are practically shut against him. As one of a minority, he has no chance of being sent to the House of Lords as one of the representatives of his order. From the House of Commons the Scotch peer is altogether shut out, and the Irish Roman Catholic peer can enter it only in the unlikely case of an English or Scotch constituency electing him. It certainly does seem hard that any class of men, under the guise of privileges which they cannot help inheriting, and which are supposed to set them above other peeple, should really, in the most important of all respects, be set below other people. It is a hard case when, as we have just seen in the late general election, a man chosen to represent an Irish borough is, before Parliament meets, raised, by no fault of his own, to a mominal rank the practical result of which

CHAUCER'S PILGRIMAGE TO CANTERBURY.

A BOUT five hundred years ago, in telling the story of his pilgrimage to Canterbury, Chaucer began the prologue to the Manciple's tale by asking:—

Wete ye not wher stondeth a litel toun, Which that yeleped is Bob up and doun Under the Blee, in Canterbury way?

Tyrwhitt, in his introductory discourse to the Canterbury Tales, published four hundred years afterwards, said that he could not find a town of that name in any map, but that it must have been between Boughton and Canterbury. In later times many discordant guesses have been made in answer to the question. Harbledown, a field called Up and Pown in the parish of Thannington, and Bobbing, a hamlet some eight miles north-west of Ospringe, have all been named in turn. But the little town is none of these, and its place is no more doubtful than the site of the Tabard. Our present purpose, however, is not merely to show where this town standeth, but to follow the poet's steps from the beginning to the end of his pilgrimage. We will follow him on foot. In our day, travellers seeking the sublime and beautiful rush from one chain of mountains and lakes to another, not looking for much pleasure by the way. In the days of our fathers, Edmund Burke thought that the sense of perfect beauty was to be found in being swiftly drawn in an easy coach over smooth turf; Dr. Johnson held that life had not many things better than to be driving rapidly along the road in a post-chaise; while Cobbett, scorning "to be drawn about in a wooden case by two horses," held that the only right way to see a country was to travel on horseback, because in any sort of carriage, you cannot get into the real country places—in which he was right; and on foot the fatigue is too great and the pace too slow—in which he was wrong. There are some who can understand how Rousseau's memory of the walk from Annecy tall'urin recalled the happiest seven or eight days of his life; who can tall from experience that to step freely along a path little known, through a fair country, in bright weather, with keen appetite, and such a pasty in the walter as the squire of the wood imparted to Sancho, is not wearisome or aluggish; and who believe with Walter Scottthat the highest delight of journeying is that of the young foot-traveller, coufident in strength and exatting

sides. While the most jealous pedestrian may resign himself to be whirled through the air across Chat Moss, the hastlest passenger through the garden of England will sometimes love to linger, and the most indolent to tread the way to Dover, like Shakspeare's Mad Tom, by stile and gate, horse-way and footpath. To foot travel as especially this note of the way is offered. It may save therefore whistling as they go, by calling up recollections of Chaucer and his times, and of things before and after.

The pilgrims can be traced from Southwark to Canterbury. Their way was along the Roman road, Watling Street, which ran with the present coach road from London to Canterbury, excepting about fourteen miles between Dartford and Strood Hill, and about nine between Ospringe and Harbledown. Chaucer has marked his path at the following places:—The Watering Place of St. Thomas, Deptford, with Greenwich near at hand, Rochester, Sittingbourne, Boughton, and Bob-up-and-down; Dartford, between Deptford and Rochester, and Ospringe, between Sittingbourne and Boughton, were also stages, and are noticed in the pilgrimages of Isabella, Edward II.'s widow, and King John of France; in an ordinance which regulated the hire of horses between London and Canterbury, and in the prologue to Lidgate's Story of Thebes. Leland, bury, and in the prologue to Lidgate's Story of Thebes. Leland, Camden, Roger Gale, Hasted, the Ordnance Map, the map of Britannia Romana in the Monumenta Historica, and other authorities, show that the pilgrims' road and Watling Street were one and the same. In the two places at which the modern road turns away to the North there are signs that the pilgrims followed the old path. Between Dartford and Strood Hill, hard by Cobham Park, where the Roman road certainly ran, on the wayside is a spring, of old times and still called St. Thomas's well; and between Ospringe and Harbledown, close to Chaucer's Boughton, is South Street, once part of the Roman Way, and three miles onward. Bob-up-and-down, where its remains are still to be seen. We need not pause to inquire, with Camden, whether a way direct from Dover to London through Canterbury is properly described as a road through Mid Kent, or, with Hasted, how far inland the marshes from Deptford to Lambeth were overflowed in very old time, and whether the earliest road may not have gone from Deptford Hill, now called Blackheath Hill, to Lambeth, along the high ground above Loampit Vale, New Cross, and Packham. We will take for granted that the Homan Way on which Chaucer travelled was Watling Street, and will begin the journey consenting to believe, as an act of homage to our poot, that the pilgrims and the pilgrimage were as real as he has made them seem to be. It must not be forgotten that the journey from London to Canterbury in the pilgrims and the pilgrimage were as real as he has made them seem to be. It must not be forgotten that the journey from London to Canterbury in the pilgrims and the pilgrimage were as real as he has made them seem to be. It must not be forgotten that the journey from London to Canterbury in the pilgrims and the pilgrimage were as real as he has made them seem to be. It must not be forgotten that the journey from London to Canterbury in the pilgrims and the pilgr rities, show that the pilgrims' road and Watling Street were one to be. It must not be forgotten that the journey from London to Canterbury, being all that remains, and with little doubt all that was ever written, of his meditated work, is unfinished. Trifling alterations, which he might have made, but which no commentator should venture to make, would keep due proportion between the length of the way and the number of verses rehearsed from stage to stage. As it is, we may be content to accept the manuscript and the order of the tales approved by Tyrwhitt, to walk by the light which he has given none, and Chaucer has left us in the dark, to grope rather than to stumble.

dark, to grope rather than to stumble.

According to our modern calendar it was on the 5th of May, or, as some say, on the 25th of April, and perhaps in the year 1387, that a company of twenty-nine, of whom Chaucer was one, met at the Tabard in Southwark, and, placing themselves under the guidance of Harry Bailly their host, made ready to begin the pilgrimage to Canterbury on the next morning. The foundation of this old inn, and perhaps part of the lower superstructure, remain, or did remain only the other day. It was repaired and enlarged about the year 1602. In 1670 it was much damaged by a fire, in which two persons were killed and six or seven wounded; and, as it is said, it was burned down in the great fire of Southwark in the year 1676. After the year 1602 the name was changed to the it is said, it was burned down in the great fire of Southwark in the year 1676. After the year 1602 the name was changed to the "Talbot"; why, does not appear. Perhaps it was no longer held sacred as a memorial of Chaucer. For eighty years, beginning in 1602, notwithstanding Milton's eulogy, he was less popular than at any other period since his death. In 1637 the inn was known by either name, "Tabard" or "Talbot"; in 1679 by the new name alone. A tabard now signifies a cloak or overcoat worn only by heralds on State occasions, without sleeves, open at the sides and embroidered or painted with coats of arms. In Chaucer's time it was the common name for a man's cloak, whether worn in war or in peace, by noble or knight, clerk, poor scholar, or ploughman; and it may have been a common sign. In the year 138there was an inn of that name in London, probably in Gracechurch Street, in which one of the ringleaders of Wat Tyler's rebellion lodged.

Street, in which one of the ringleaders of Wat Tyler's rebellion lodged.

Early in the morning of the 6th of May or the 26th of April, leaving the Tabard in Southwark, the pilgrims rode quietly down. Kent Street, which, within living memory, was the only way from Kent into the City of London, and along the Old Kent Road to the Watering of St. Thomas, where, according to Hasted, Roman remains have been found:—

And forth we riden a litel more than past Unto the Watering of Seint Thomas.

This place is about a quarter of a mile short of the second milestone from London Bridge. At the north-western corner of the Albany Road, a modern way from Camberwell into the Old Kent Road, stands the "Saint Thomas à Becket," a new tavern; opposite the eastern eide of this tavern, at the north-eastern end of the Albany Road, a row of small houses, formerly called St. Thomas's Place, and still remembered by that name, ran eastward from the Old Kent Road. Not many years ago two or three of

these houses, those nearest the Albany Road, became ruinqua these houses, those nearest the Albany Road, became ruingus and were pulled down. In the garden of the second or third of the demolished houses was a spring which, according to tradition, once overflowed, forming a shallow piece of water—the Watering of St. Thomas. Here the Host halted, and called upon his fellow-travellers to decide by lot who should tell the first of the tales with which they were to shorten their way. They drew outs, rode forward, and the Knight began. At the end of the third mile is the Manor of Hatchan, where the road from Lambeth through Camberwall and Peckham falls into the Kent Road, which, a little onward, at New Cross, where it is travarsed by the present onward, at New Cross, where it is traversed by the present boundary between Kent and Surrey, divides into two branches—one leading through Lewisham to Tunbridge; the other, which we follow, through Deptford, the deep ford over the Ravensbourne. Here, the tales of the Knight and the Miller being suded, the Host bade the Reve to stay his preaching and say forth his tale:—

-What amountoth all this wit? —What amounted all this wit?
What! shall we speke all day of holy writ?
The divel made a Reve for to preche,
Or of a souter a shipman or a leche
Say forth thy tale, and tarry not the time:
Le Deperord, and it is half way prime.

How nearly the very earliest road into Kent approached the channel of the Thames we cannot tell. The present highway from New Cross to Deptford seems to have been a causeway raised above the ground which declines towards the north, now covered above the ground which declines towards the north, now covered with houses, but heretofore, before railways were known, a vast cabbage garden, and in Chaucer's time probably a marsh. The Rolls of Parliament show that before the year 1310 the river, which had been dammed out of the lowland between London and Greenwich, had broken its artificial bounds, overflowing the meadows of Hatcham, and had been driven back again. After passing through Deptford, on the left hand was Greenwich, traduced by some lost legend:—

Lo Grenwich, ther many a shrow is inne, It were al time thy tale to beginne.

This is one of the three places, all in Kent, in which Chaucer is known to have possessed land. He was tenant, but only as guardian or trustee for other persons. It does not seem that he over had one foot of earth of his own. Two of these possessions serve to connect him with the Vintners' Company. The City Companies were a great power in the kingdom, and, by taking part in a strife between some of the most powerful, he brought himself to repreach and country. According what was then called Doutfurt Hill the and poverty. Ascending what was then called Deptford Hill, the pilgrims came upon Blackheath. Journeying to the tomb of one murdered Archbishop of Canterbury, they had before them, on the murdered Archbishop of Canterbury, they had before them, on the right hand and on the left, the graves of the Danes who, while Thurkill's fleet lay below at Greenwich in the year 1012, after a drunken feast, murdered another, St. Alphoge. There was a third; Simon of Sadbury, who, a few years before the pilgrimage, and two days after Wat Tyler with his tens of thousands encamped upon Blackheath, foll a sacrifice, with meaner victims, to the fury of the London rabble. The shrinks of the murderess were still ringing in the poet's ears while he wrote the Nun's Princip to the still ringing in the poet's ears while he wrote the Nun's Priest's tale :-

Certes he Jakke Straw and his meinic Ne maden never shoutes half so shrille When that they wolden any Fleming kille,

Not staying to tell the contrary judgments of Chaucer and Cower Not staying to tell the contrary judgments of Chaucer and Gower upon this insurrection of the commons, we cross Blackheath, where, according to Dr. Plott and Roger Cale, in the seventeenth and eighteenth centuries, plain traces of Watling Street were to be seen a little to the right of the high road to Dover, and, going over Shooter's Hill and through Welling, where the course of the road has been changed, we arrive at Bexley Heath, upon which, in Hasted's time, at the close of the last century, Watling Street was plainly visible towards Orayford. Perhaps near Bexley Heath, certainly after the tales of the Reve, the Cook, the Man of Law, and the prologue of the "Wife of Bath" had been told, and long before the travellers came to Rochester, the Summoner threatened the Friar that before they suproached the Summoner threatened the Friar that before they approached the end of their journey, before they reached Sittingbourne, about forty miles out of the fifty-six, he would tell two or three tales of Friars which should grieve his heart:---

I beshrewe me
But if I telle tales two or three
Of freres, or I come to Sidenburns,
That I shal make thin herte for to morns.

Crayford, formerly Creeganford, was the field of the great battle, in the year 457, in which Hengist and his son Aze slaughtered the Britons. After crossing the Cray, a trout stream which has given its name to many little towns through which it flows, not long ago real country places, and two miles onward, passing over Spenser's pure Darent with its ten thousand fishes, which the pilgrims passed through for there was no bridge there in that the pilgrims passed through, for there was no bridge there in that day, we reach Dartford, known as one of the stages to Canterbury from the journals of the attendants of Queen Isabella and King John, as well as from the ordinance of backneymen in the year 1396.

(To be continued.)

FIRES, WARS, AND ART TREASURES.

IT is not wonderful that the burning of the Pantechnicon has a caused an extraordinary sensation in London society. Although it chanced to coincide with a national plobiscite, a transfer of power, and a change of Ministry, we should have heard a great deal more about it if so many people had not been out of town. For never before has a fire occurred anywhere in which "society" had so intimate a concern. There have been fires abroad and at home which have wrought incomparably more destruction and desolution. Eastern cities like Constantinople are perpetually being hypered down by whole districts: but if the victims of these desolution. Eastern cities like Constantinople are perpetually being burned down by whole districts; but if the victims of these conflagrations make claims on our charity, they neither receive nor expect much compassion. They build houses of wood as if they intended them for bordires; and there is scarcely a new Insurance Office on its promotion anywhere that would take risks in Galata or Stamboul at any price. We subscribe to catastrophes like that of Chicago, and sympathize with the sufferers; but Chicagos after all are a long way off, and we have an idea that those dashing speculators of the Far West are always coming to grief in one shape or another, and should be proof against fires as those dashing speculators of the Far West are always coming to grief in one shape or another, and should be proof against fires as against other vicissitudes of fortune. We have had our own great fires in London; but, except when they periodically swallow an Opera House, they excite but an ephemoral sensation at the best. The greatest fire of all, the fire commemorated by Pope's lying Monument, was a City affair altogether. Popya and other hangers-on of the Court took coach at Whitehall and drove curiously eastward to assist at the spectacle; while his merry Majesty of most moral memory made a state progress on horseback to the scene, to look as sympathizing and serious as it was in his nature to do. We have looked on ourselves at great blocks of warehouses blazing in Tooley Street, when cataracts of lead and fiery oil streamed down from the roofs and the windows, and the fiery oil streamed down from the roofs and the windows, and the waters of the crowded Pool ran red with sheets of flaming tallow. But fires like that in Tooley Street are strictly the concern of the Insurance Companies; if people in business are not insured, they ought to be; and if they do make losses when they looked for gains, is but an unlucky incident in the career of money-making. Besides, at the worst, there is no great reason for making a mean over spilled oil and wasted tallow. There is plenty more where these came from, and if we must submit to a rise in the price of candles, we feel that we might have had to put up with worse calamities. It is the character of the contents of the Pantechnicon that removes its destruction from the category of commonplace configurations. Few people had any conception of the wealth and artistic value of its contents until recent lamentable disclosures and artistic value of its contents until recent lamentable disclosures enlightened them. The frontage in Motoomb Street gave no adequate notion of the acreage of area that lay behind; and probably few even of the depositors had any idea of the aggregate of property of which their own formed an item. In course of time the place had come to be regarded as an institution among the occupiers of the neighbouring houses; and their faith in the absolute security of the repository was as firm as the faith of the City in the Bank of England. No other capital in the world could have formed such a collection, for in no other capital does a similar class of contributors exist. Landon is the only capital where so many imposing mansions, more or less magnificently decorated, are inhabited through so short a senson of the year. The leaders of London society, who fill rooms and galleries with objects of art, set their chief affections on residences in the country. Yet, in a natural rivalry of notignoble oscination, they are apt to choose some of the choicest gens of their favourite collections for the adornment of the houses which they occupy when in town. But when a great house is left in charge when in town. But when a great house is left in charge of a venerable housekeeper, it is not impossible that fires may break out, and it is very probable that thieves may break in and steal. Pictures and porcelain and ponderous sculpture in and steal. Pictures and porcelain and ponderous sculpture are not to be lightly hazarded ou railway journeys, and they are scarcely the class of articles that a man would think of imposing on the most accommodating of family bankers. What more natural, then, than to turn over all that was most dearly prized to the care of the spirited proprietors of the l'antechnicon? It was known that their premises were supposed to be so absolutely fireproof that bankers themselves deposited their most precious papers with them. There has been a heavy loss of furniture and plate in the thom. There has been a heavy loss of furniture and plate in the Pantechnicon, and of course we are sorry for the people who have suffered; but, after all, ordinary furniture and plate fall into the same category with oil and tallow—they may be replaced, and they ought to have been insured. With works of art it is altogether different. Their owner may insure them or he may not; but, insured or uninsured, their loss is equally to be deplored. And in the first pangs of regret felt by a genuine and enthusiastic collector, the pecuniary consideration will probably go for very little. He will be as slow to console himself as a doting husband who has lost his bride in a railway accident, and afterwards learns that she had insured her life with an Accident Insurance Company.

Company.

We do not yet know what we may have lost by the fire, and perhaps we never shall know exactly. It is the nature of some men to exaggerate their losses, and of others to be silent and consign them to oblivion. Unhappily, it is certain that we have been deprived, of much that we could very ill afford to spare; for of this the names of the chief sufferers are only a too sufficient guarantee. Yet, setting our losses at the highest estimate, we cannot but remark how little reason on the whole the

world has to complain of similar mishaps. The more we think world has to complain or some marvelous it seems that so many great paintings about I have been snared to us memerating after generation, or makes of it, the more marvellous it seems that so many great paraming should have been spared to us generation after generation, or mather that comparatively so few should have disappeared. Nothing assumption of the more delicate than a square yard or two of films, canvas. Covered with colour by the hands of a master it acquires, a value of hundreds or thousands of poundational in the act of colouring becomes so much the more destructible. Sensitive alike to heat or damp, a single moment of extremely a property of the same destructions. tible. Sensitive alike to heat or damp, a single moment of carriessness may injure it irremediably, even should the substance remain intact. As it grows in age, it grows in reputation; and as its value becomes positively priceless, it is exposed to altogether exceptional dangers. Raffields points his "Transfiguration," and forthwith the picture is as much prized by its possessors, and often as much coveted by their unscrupulous neighbours, as these "mountains of light" in the Oriental treasure-heuses which have subverted dynastics by properties warm. Vet that had any constant subverted dynasties by provoking wars. Yet that last and greatest work of Raffaelle is still safe after its many travels and adventures; and so it is with almost every picture of extraordinary celebrity. Run over the art lists in any country, go back to the generation of artists that preceded the general Renaissance, and how very few, comparatively speaking, of their works are missing! Yet the only danger from which they have any immunity is private theft. Victorious monarchs or French marshals may make them open prize of war, in virtue of the right of the strongest; but there would be little use in appropriating a picture which it is impossible to produce in any market, and which you dare not ask your friends to admire. To all other risks pictures are exceptionally liable, and especially to the right of war and lire; and, as it happens, the countries which are vichest in ant treasures have been most regularly devastated by fire and sword. From the days of Ciotto and Cimabue, and indeed long before, Frenchman and Spaniard, German and Swiss, Fleming and Austrian have fought out their quarrels in Italy. The country was split up into republics and principalities which were always at daggers drawn. Every tures; and so it is with almost every picture of extraordinary coleand principalities which were always at dangers drawn. Every city and its factions and its protenders, and when by any chance there was a cossition of war, the disbanded troops took the field as condition. Belgium was the battle-ground of Europe, and from the days of Alva the cities of the Low Countries have been familiar with sack and fire-raising. Spain had troubles of been familiar with sack and fire-raising. Spain had troubles of its own, even before it received a king from Napoleon, and his generals made discriminating requisition of the finest Murilles and Velasquez in its art collections. There is scarcely a picture that hangs in its old place in any of those quiet old Italian or Flemish churches but must have had many escapes that bordered on the miraculous. For, when cities were in flames and given over to pillage, it was generally to the churches that the women ran for refuge. The women and the church plate were sure attractions for the soldiers, who had small respect for the sanctity of the alter, and went rushing about, torch in hand. the sanctity of the altar, and went rushing about, torch in hand, among the inflammable wood-work. Many a sacristan tells the time-hallowed story of some one of his predecessors in office who, in his self-sacrificing devotion, risked or lost his life to save the painting that was the pride of his church. But the eternal sacristan cannot have been always in the way at the critical moment; and we can only imagine that patron maints took a personal interest in the noble works that had been offered in their honour. Be that as it may, not only do many churches retain to the present time the precious altar-pieces which were painted centuries ago by the Titians or the Van Eyeks, the Rubens or the Alonso Canos; but in spite of reformers, iconoclasts, and soldiers broken loose with license to burn and destroy, wholegalleryfuls are spared to us, like those of Paris, Madrid, and Vienna, Florence, Dresden, and Munich, tilled with paintings collected from churches, convents, and chateaux over the length and breadth of Europe. On the whole, too, these pictures are in excellent preservation, although so many of them must have had eventful histories, did we only know them. Considering the conditions on which modern wars are waged, it may be hoped that the great works of the middle ages are at last tolerably safe. The cities that contain them are scarcely ageare at hat tolerably safe. The cities that contain them are scarcely likely to be subjected to anything worse than bomberdments from distance, even where they have been improdent enough to walk themselves in. But the dangers from fire are nearly as great as ever, in spite of fire-engines and fire-brigades, and other modern appliances. The Pantechnicon was presumed to be as safe as precautions could make it, and yet it burned like cardboard stuffed with tinder. We do not precisely know what may be the arrangements at the National Gallery, or in the rooms at South Konsington; although we fear that, in the event of a the rrangements at the National Gallery, or in the rooms at Source Kensington; although we fear that, in the event of a the, it would search out some weak point in the defences. But how is it, we ask, that so many collections in old foreign efficients been spared to us, through the chances and changes of successive centuries? We may presume that the guardians of the Galleries in the Vatican, the Fitti, or the Uffisi, must govern their conduct by that profound faith in a superintending Fronti-dance which makes the ordinary Italian so sublinely careless of dence which makes the ordinary Italian so sublimely careless of consequences. We know that the over-warmed private collections in the great Homan palaces are often entrusted to the charge of ancient servitors, whom a truer economy would have superannuated on pensions. There is no Roman Captain Sting, with his Prestorian Guard of chivalrous finemen, and have the citizens of the Eternal City ever heard of a hydrest in the whole. citizens of the Eternal City ever heard of a hydrant in the whole course of their lives. Yet somehow fires never do break out in these Galleries, or else they have always been so speedily estimatished that they have done no damage, and no one has heard of them.

On the whole, the art world has so much good fortune to be thankful for that it ought not to muraur even at losses as serious as those of the Fantachnicon, eithough it is only in human nature that it will be the more inclined to marginar for that very reason.

GUELF AND CHIBELLINE.

buting the sales on Ash Wednesday, according to the Roman seasonial, observed a leading member of the Ghibelline party mong the pentients before him. His Holiness could not resist be temptation to take what can hardly be called a fair advantage of the properties of the resistent formula. the temptation to take what can hardly be called a fair advantage of the situation, and instead of the prescribed formula, Memosto, home, quie pulse as et in pulserem radiois, said, as he placed the sames on the head of his kneeding foe, Memosto, home, quie Ghibellinus as et in attenum peribis. Pius IX., who is supposed to be fond of his little joke, would not perhaps hesitate to avail himself of a similar opportunity; but then neither the German Emperor nor Prince Bismarck, nor even Bishop Beinkens, is very likely to present himself before the alter at the Vatican. In these days, however, when the result not to the same and such vever, when the penny post is the medium of so many and such various communications, even crowned heads do not think it bewarrous communications, even crowned heads do not think it be-meath their dignity to exchange "winged words" in a manner-little dreamed of by Homeric chieftains or mediaval Pontiffs. Thus, for instance, last autumn rather a brisk correspondence, considering the position of the high corresponding parties, was carried on be-tween the Pope and the Gorman Emperor; and now we have the Emperor addressing "dear Lord Russell" in the same familiar manner. Old-fashioned people might be disposed to question the congruity, if not the wisdom, of the procedure. The divinity which doth hedge about a king in rather radely impossible when Papal and Imperial combatants descend into the creus, instead of lying beside their nectar and gazing down serenely from golden thrones on the battle raging at their fest. Litera scripta wanes, and letters published in the newspapers, though written by hands that hold the acceptre as well as the pen, become inevitably the subject of profuse criticism. The Emperor William is a potentate who at least professes to govern as well as to roign, and he is evidently unwilling to let the whole credit or discredit of his policy rest on the broad shoulders of the Imperial Chancellor. Neither indeed are his Exactled Description and admires who have sleeted under the quidance aids their nectar and guzing down serenely from golden thrones on the shoulders of the Imperial Chancellor. Neither indeed are his English Protestant admirers, who have elected, under the guidance of a veteran Whig statesman, to address their felicitations directly, not to his responsible advisors, but to himself. It certainly required some courage, not to say audacity, to take such a step, when we remember the composition of "the great meeting in London" which passed the resolutions enclosed in Earl Russell's letter. which passed the resolutions enclosed in Earl Russell's letter. Could his Imperial Majesty be supposed to condescend to the perusal of English newspapers, he might have learnt that no single representative of the English aristocracy, and no single commoner of even second-rate position or influence, was rash enough to take part in the No Popery demonstration of last month, which accordingly was in no sense, as he seems to imagine, a representation of "the people of England." In mere numbers even—and it is seldom difficult in this country to collect a mob to shout "Town with the Pope!"it fell conspicuously short of the Roman Catholic counter-demonstration of the following week. One can hardly help suspecting that the Prince Chancellor, who has little sympathy with the purrilities of Exeter Hall functions, must have laughed in his alcove at the dreary platitudes of Mr. Newdegate and Dr. Payne Smith, which have been thought worthy, Newdegate and Dr. Payne Smith, which have been thought worthy, not only of a special report from the German Ambasador to his Sovereign, but of a verbose et grandis epistola from the Sovereign himself to the Earl, who was provented by a seasonable access of influenza from presiding on so inacepicious an eccasion.

The Emperor William evidently writes in good faith. It used to be thought, and is apparently still believed by the Prussian bishops, that he had unwillingly allowed himself to be drawn into sanctioning the persecuting policy of his Government. But there can be little doubt, after reading this remarkable document, that His

the Emperor William evidently writes in good latth. It used to be thought, and is apparently still believed by the I'russian bishops, that he had unwillingly allowed himself to be drawn into sanctioning the persecuting policy of his Government. But there can be little doubt, after reading this remarkable document, that His Imperial Majesty has contrived to persuade himself that he is the inheritor alike of the title and the European status and responsibilities of the chiefs of the Holy Roman Empire who did battle so manfully with the Gregories and Innocents of a farmer age. He conceives himself to be engaged in "a struggle maintained through centuries past by German Emperors of earlier days, against a power the domination of which has in no country of the world been found compatible with the freedom and welfare of nations, which, if victorious in our days, would imperil, not in Germany alone, the blessings of the Beformation, liberty of conscience, and the authority of the law." Big words these when applied to the claim of the Prussian bishops to regulate the affairs of their own communion according to its own laws and customs—a claim which, till two years ago, the Government had readily conceded. But it is the historical attitude of the Imperial letter—writer that strikes us in the oldest light. History is notoriously a speciality of German scholars, but hardly, it would appear, of German Rovereigns. If we admit, for arguments ealer, that the Pressian Kaiser is the lineal successor of the Hohenstaufen and Hapsburgs, it still remains a mystery how the mediaval Emperors can have struggled to preserve to their subjects "the blessings of the Reformation." And even sensition—what would require a good deal of explanation and modification—that they centended for liberty of conscience and the authority of the law, the sugmented parallel is hardly less parallering. A Pope whom would small chairs

dynasties, who made and unmade kings, and was the adiscretical suscents of all European States, occupied a very different position from the discreward "prisoner of the Vations." The notion of diseasibilishing the Church would have been hippealible, or rather simply unintelligible, to the product and most powerful of these old rivels of the Papary, when the Secundarium and Imperium were universally regarded as the two great pllars on which the whole edifies of civilized mostary reposed. King William could diseasibilish the Pressian Oatholic Church to-morrow if he chose, and no flugar would be lifted to resist him either in Germany or beyond it. But, it is the very last thing he would choose to do. His ideal, or at least his Chancellors, is not a free Church in a free State, but an established Church under the control of the Minister of Worship. He has preferred to enact regulations which would certainly not be tolerated for a moment, and would indeed have no chance of passing a first reading in the House of Commons, if sought to be applied to the Established Church of England, which is far more closely bound up with the State than the Roman Catholic Church is, or can be, anywhere. The Emperor insists, it is true, in this letter that "the latest measures of his Government do not infringe upon the Roman Church or the free exercise of their religions by her votaries." That however is a question rather of fact than of opinion, and when the professors of any religion combine in assorting that they are debarred from its free exercise, the presumption is strongly in favour of their being right about a matter of which they are clearly the most competent judges. This does not of course necessarily prove that the interference is unjustilable. The laws of every civilized country would scriously hamper the Thuga in the free exercise of their religious customs, and would be more than excusable in doing so. But before the analogy can be made available in doinnee of the Roman Catholic religion is incompatible with the safety o

pulsas ego capulo tantum—seems to go on merrily. The Archibishop of Posen is in close confinement, and it is a mere question of weeks or days how soon his archiepiscopal brother of Colorne of weeks or days how soon his archiepiscopal brother of Colognes will follow him to prison, while fresh laws are in course of enactment for the "interning" of all priests and the banishment of all bishops who disobey the May laws; several priests, as well as Evangelical pastors, are in prison already. And the state of Catholic sentiment on the subject, both within and beyond the limits of the new Empire, is tolerably pronounced. The only seeming exception, which is easily enough explicable, is among the deputies from Alsace and Lorraine, most of whom prafer to follow the lead of Herr Teutsch in postponing religious to political interests, while a minority are disposed, with the Bishop of Strusburg, to adopt an opposite line of conduct; but in principle all are agreed in resenting both the ecclesiastical and the civil policy of Prussia. In Austria the feeling appears to be equally strong. The General Conference of Catholic Unions at Vienna has publicly testified its "revenence and admiration for the heroic champion and marter of "reverence and admiration for the heroic champion and marter of the Catholic Church and faith" now in prison, and a similar address to the Archbishop of Posen has been voted by the Catholic Union of Bohemia. The Austrian bishops are naturally not less outspoken in denouncing "the oppression of the Church," and a solemn mass has been celebrated at Prague, under the authority of the Cardinal-Archbishop, "to supplicate the Divine assistance for the deliverance of the persecuted Church in Germany." The new ecclesiastical measures proposed for Austria are meanwhile quite unsettled; but, as a judicial decision has just been given declaring unsettled; but, as a judicial decision has just been given declaring the nullity of marriages solemnized by Old Catholic priests, and the number of Old Catholics is rapidly increasing in parts of the Empire—notably in Northern Bohemia seems fresh legislation is urgently required. In Prussia the bishops have issued a joint memorial, addressed this time, not to the Emperor, but to the clergy and laity of their communion throughout the country, in reference to Archbishop Ledochowski's imprisonment, "simply for refusing to sacribes the liberty of the Church, and to deny the faith." They indignantly reported the charge of civil disallection, but insist that there is a nonit where charge of civil disaffection, but insist that there is a point where obedience to the civil power must cease, on the acknowledged principle of obeying God rather than man, and that their conscientions replie of obeying the rather than man, and that their charles resistance to laws inconsistent with their duty to the Church is not rebellion. They are accused of giving up the Prussian Church, by their obstinacy, to destruction; but if it is destroyed, they disclaim all responsibility for the result. "Sooner let the Church perish in its parity than be perverted through the faithlessness of its pastors! Christ feunded not national Churches, but one Catholic Church." And this Church, they characteristically addi-for persecution has of course quickened their new-born seal for infallibilism—is placed under the supreme and exclusive control of infallibilism—is placed under the supreme and exclusive control of "one man, Peter, and his successors, the Popes." A good deal of irrelevant and sufficiently intemperate abuse follows, of "those appeatate heretics who style themselves Old Catholics and are Protestants," which does not add to the force or dignity of the document. And then come anticipations and augustions for the future. Times of tribulation are approaching, when the people may be left as sheep without a shepherd, but the priests are to attest their fidelity by sacrificing themselves, and the laity are earnestly exhorted to stand firm in their faith and loyalty, when deprived of all ordinary means of grace, and to be sure above all to educate their children carefully in the true doctrine of the Church, and on no account to accept priestly ministrations at the hands of unauthorized pastors. This is evidently intended as a counterblast to the memorial recently issued by the Central Committee of the Old Catholics of North Germany, to which we called attention the other day. It shows that the probable ceasation of Catholic worship throughout a large part of the country is a contingency which the bishops have learnt distinctly to contemplate, and that they count on the steadfastness of their flocks in abstaining under such trying circumstances from all acceptance of the proffered ministrations of the anti-infallibilist clergy. An opposite assumption, of extensive though unacknowledged sympathy with the anti-Papal party in the Church, no less unmistakably pervaded the last Old Catholic manifesto. Which assumption is the better grounded, experience only can decide. But in neither case can the Emperor William's estimate of the proper method of directing "the battle imposed upon him" find favour with those who prefer the principle of liberty of conscience to what has been not inaptly designated a system which aspires to make every priest a certificated Government official, and to subject all religious instruction, in church or college, to "the imprimatur of a Pope in jack-boots."

BLABBING.

THE poets and moralists who have grown eloquent over the sufferings caused in the world by women have generally been thinking rather of the tragic than of the comic side of life. The Helens who have wasted ships, men, and cities by their fatal loveliness; the Olytemnestras and Guineveres who have recklessly opened the floodgates of crime rather than stifle one guilty passion; the Oleopatras who have enslaved their fatherland for the pleasure of making man love them, and those other celebrated women of making men love them, and those other celebrated women whose life has been the old tale of

Beauty and anguish walking hand in hand The downward slopes of death,

occupy a much larger place in the world of imagination than the Catherines and other shrews who, from circumstances over which they had no control, have been forced to content themselves with they had no control, have been forced to content themselves with the humbler part of making ordinary men miserable in a common place sort of way. And yet it seems probable that on the stage of life at least as much pain is caused by the women of comedy as by the tragedy queens. No doubt the great Spartan elopement gave rise to more suffering than is caused by any one case which comes before Sir James Hannen. But then against this we may consider how much more frequently the case as dealt with by Sir James Hannen occurs than the case as handled by Homer. And also we may remember that hereig sufferings are not such an unmixed exilt Hannen occurs than the case as handled by Homer. And also we may remember that heroic sufferings are not such an unmixed evil as those of more insignificant people. There is a large amount of good to be set off against the sufferings and pain caused by the sack of Troy. But there really is nothing, or next to nothing, which we can set off against the petty miseries caused by the commonplace jilts and shrews and tale-bearers of everyday life. Paradoxical as it sounds, there is a sense in which "the greater the sufficient the less the pain" suffering the less the pain."

Among the many modes of tormenting practised by the ordinary woman of society, one of the worst is her habit of blabbing, or repeating to one dear friend the things that have been lately said and done by another dear friend. Some women are positively ill-natured and blab from malice. Old maids whose life has been soured by disappointments, or who from want of proper education to their worth have no stripentary meaning of comparison. in their youth have no satisfactory means of occupation, are sometimes found to be tuinted with this vice. Telling tales is to them what torturing flies is to naughty children. The emotion displayed by a mother when they tell her that her son at Oxford is constantly by a mother when they tell her that her son at Oxford is constantly in the company of such or such a well-known scapegrace; the disquiet of a young girl when they hint to her that her lover is generally believed to be deeply in debt, or when they repeat to her some remark of his which they know she is likely to think "shocking"; the annoyance visible in the face of a sensitive man when they retail some careless and uncomplimentary remark made about him by some one whose good opinion he values—all these tokens of suffering cause them positive pleasure. The terror which these people inspire among their neighbours gives them a sense of power, and affords them some compensation for the neglect of men, the condescending airs of mothers and wives, the sickening frivolity of the young the impudence of officials, the trranny men, the condescending airs of mothers and wives, the sickening frivolity of the young, the impudence of officials, the tyranny of cabmen, and all the other real or faucied injuries of society. Every London coterie and every country village numbers at least one of these harpies; and a man who cannot reckon one of them among his own near kinswonen may think himself fortunate. "Es muss such solche Kauze geben." But these are not, after all, the only women who do harm and inflict suffering by their habit of blabbing. "To blab," as Dr. Johnson says, "usually implies rather thoughtlessness than treachery; though it may be used in either sense." The majority of women blab, not from malice, but, as somebody is said to have whistled, for want of thought. And probably quite as much pain and annoyance is caused by thoughtless as by treacherous blabbing. In this, the truest sense of the word, every fifth or sixth woman in society is a blab. Two elementary principles of social well-being are more

or less systematically violated by numbers of women in so One of these principles is that there are many things which, thou One of these principles is that there are many things which, though not in the strict sense of the word secrets, should not be repeated. The other is that there are some persons to whom certain things, not secrets, should not be repeated. Both these principles are comprised under the more general maxim that the sayings and doings of friends are not common property. And both of them are, to the infinite misery and discomfort of society, neglected by the blab.

the blab.

The common blab—that is to say, every fifth woman in society—proceeds upon the principle that whatever has not been communicated to her as a "solemn secret" she is at perfect liberty to communicate to another. Not only does she think it perfectly lawful to communicate to her friend of Tuesday whatever happens to have been said or done by her friend of Monday, but she looks upon this liberty as a kind of natural right, and resents the notion of putting any restraint upon herself in such a matter. "How sensitive you men are!" she cries, whenever any one after a picnic, a water party, or any other day of pleasure—when perhaps many unguarded words have been spoken, and some unpremeditated deeds have been done—ventures to suggest that it will not add to the day's enjoyment to be continually talking about it all next week. At the close of any successful day of this kind, when women have been of the party, and when the usual remark is made that "We have had a perfect day," the reply that naturally occurs is, "Yes, if we might never hear another word about it." But such a wish is very soldom expressed, for the simple reason that it would be absolutely disregarded by almost overy woman of the commany. Every one knows that the day after the But such a wish is very seldom expressed, for the simple reason that it would be absolutely disregarded by almost every woman of the company. Every one knows that the day after the feast is the time when the blab is in her glory. Part of the next morning she spends in writing off a few piquant details to her mother and sister and most intimate friends; for the blab is generally quite as free with her pen as with her tongue. Her friends say of her, "What a capital letter she writes!" and encourage her by their applause and keen appreciation of her funny stories. She has acquired a reputation for being amusing, and she knows how to applause and keen appreciation of her runny stories. Some acquired a reputation for being amusing, and she knows how to maintain it. If the sayings and doings of the preceding day fail to afford matter of sufficient amusement or interest, she is not thereby baffled. There is always the imagination to be drawn upon. The cleverest blabs—those who are most welcome to the women and most dreaded by the men of their society—do not rely on memory only for their stock in trade. There are few things so funny in fact but that they may be made a little funnier by a touch or two of fiction. And the woman who is good at repeating is almost always good at inventing. The tales which the blab sends to her friends in her letters are of course fixely used by those friends for their own purposes of talk and letter-writing. And the man who has taken one of these ladies down to dinner on Monday may who has taken one of these ladies down to dinner on Monday may have the satisfaction of feeling that it is far from improbable that by Wednesday some of his remarks will be circulated in two or three of the remotest counties of England and Wales.

But it is in talk, of course, and nearer home, that the blab is most effective. Most women would be utterly at a loss for sufficient most effective. Most women would be utterly at a loss for sufficient conversation to fill up the gaps after dinner, at afternoon tea, and on rainy days, if they were forbidden to repeat and discuss the savings and doings of their friends. Dress is no doubt a topic which will fill up a good deal of time. But even dress is not an inexhaustible subject, and it has the great disadvantage of not being available in mixed company—that is, when there are men present. Resides, interesting as the subject of dress is, it vields in interest to the matters handled by the blab. She is a kind of siren, exercising a fatal fascination from which men, as well as women, when once they have allowed themselves to become well as women, when once they have allowed themselves to become well as women, when once they have allowed themselves to become used to listening to her, find it very difficult to disengage themselves. You try to escape from the room. She arrests you with one of her usual formulas:—"Oh, I must tell you what Mrs. Asid the other day. She was talking about you"; or, "I want your opinion on Mr. B. Do you think him clever?" It is of little use to weigh your words in talking to her. For, however innocent and judicious what you say may be, you know that she will retail it in such a way as to make you out either malicious or silly. If your observations on Mr. B. are disparaging, she tells your friends you "can't endure him." If what you say is complimentary, you are represented as quite "devoted" to him; whereas perhaps all the while B. is to you a most ordinary person, unassociated in your thoughts with any feelings of intolerance or devotion.

Tickell, writing in the Spectator in 1712, proposes that, in order to put to shame a certain class of persons who were in the habit of talking rudely in the presence of ladies, a particular form of padlock should be designed and sold, with printed directions for fastening it on the mouth; and that any woman whose modesty was offended by one of those rude talkers should be at liberty to produce the padlock and read the directions before his face. Might not some such plan as that suggested by Tickell be tried with our blabs in the present day? It would not agree with our modern notions of politimess to produce a padlock and a printed paper in the course in the present day? It would not agree with our modern notions of politeness to produce a padlock and a printed paper in the course of dinner or of afternoon tea. But surely some enterprising firm might design a neat little padlock in aluminium, to be worn by ladies as a charm, and to be sent anonymously like a valentine by any one who has been injured by the thoughtless recklessness of a blab. Advertised in such men's newspapers as the Field or the Army and Navy Gazette, under some such name as "The Gentle Hint," these little contrivances could hardly fail to meet with a genuine success. If the ladies to whom they were sent wore them, they would answer the purpose of warning unwary

men of the danger flay van. And if any blab should dealine to appear in while waring her pedicek, it might be hoped that she was a little waring her pedicek, it might be hoped that she was a little waring her pedicek, it might be hoped that she was a little passion. To anybody sincerely anxious of caring herest of the passions habit of blabbing, the little padicek, fastened to her bunch, of keys, would afford valuable help, reminding her whenever it met her eyes of her fault and of her resolution to walket. If this suggestion should be adopted by any London jeweller, the padiceks might be ready for general use before the hegiming of the next London season. But meantime we venture to suggest to all blabs anxious not to let the recess pass away without beginning the work of self-reform, to address themselves to the difficult task in the spirit of a prayer which we lately heard attributed to a little child of six—"Hiess dear paps and mamma, and help me to cure my tell-tale-titness."

NOISELESS STREETS.

NOISELESS STREETS.

THE great paving controversy in the City has for the present been set at rest by the decision of the Commissioners of Sewers that granite, asphalte, and wood shall continue to be employed until their respective merits are more conclusively ascertained. This seems to be a very reasonable decision, and we have no intention of impugning it. Nor are we prepared to espouse the cause of any of the rival materials. Granite indeed we hope to see given up before long, but it will be as well to decide what substitute shall be adopted before it is finally abandoned. It is unfortunate that a question of this kind should be complicated by the competition of commercial interests. It will no doubt be a serious loss to the purveyors of granite if it ceases to be used for paving, and it will be a proportionate gain to the manufacturers of asphalte or wooden pavement if either is permanently introduced. All we are concerned about is the comfort and convenience of the public, and we will merely indicate one or two considerations which are concerned about is the comfort and convenience of the public, and we will merely indicate one or two considerations which ought to be kept steadily in view. What we have a right to expect in London is less noise from traffic in the streets, less annoyance from repairs, and such a condition of highway as will enable the absurd and monstrous monopoly of the Tramway Companies to be done away with. In order to secure these ends the paving should be smooth, level, endurable, and capable of prompt and easy repair. Expense is a question of altogether subsidiary importance. There is not a great deal of difference in this respect between the different materials, and the material that answers the purposes we have mentioned will cermaterial that answers the purposes we have mentioned will certainly be the cheapest in the end. A great city like London ought not to distress itself about minute fractions of expenditure when an not to distress itself about minute fractions of expenditure when an important public convenience is in view. Mr. Heywood, the engineer to the Sewers Commission, has prepared an elaborate report showing the different qualities of granite, asphalte, and wood as tested by the experience of some six or seven weeks. Asphalte is smooth; traffic passes over it softly and with comparatively little noise; and, when a small part of a street has to be taken up either for repair or for getting at the gas or water pipes, asphalte offers great advantages in being easily cut out and restored in the course of a few hours. Asphalte, however, in the forms in which it has been tried, has one serious defect; when it becomes moist it is extremely slippery for horses, and if they slip they are apt to fall in a very distressing manner. Wood, on the other hand, is considered to afford the best footing for horses, either in wet or dry weather. We should imagine, however, that in frosty weather it would not be so satisfactory as asphalte. Wood is also superior to asphalte in regard to noiselessness. There is a clatter of hoofs on the latter, though wheels glide along softly; but in the case of wood the sounds of hoofs and of wheels are alike deadened. Anybody who has driven along Fleet Street, up Ludgate Hill, and then along Cheapsounds of hoofs and of wheels are alike deadened. Anybody who has driven along Fleet Street, up Ludgate Hill, and then along Cheapside will understand the difference between granite, wood, and asphalte in this respect. As to repairs, the engineer observes that in regard to wood experience on this point is too limited to warrant a confident opinion; but he has heard that in former experiments with wood there has been a tendency in the blocks to wear into a round form. The choice, we imagine, must lie between asphalte and wood, or some other material or combination of materials that may hereafter be invented. For granite there is really nothing to be said. It is slippery, noisy, and troublesome to repair. The only reason for going on with it is that it is there, and that it is as well to keep to it until it has been determined what sort of paving shall be used instead of it. be used instead of it.

be used instead of it.

It is the defective condition of the present roads that supplies a pretext for the tramway lines. Whether in the shape of macadam or in blocks, granite quickly breaks into holes and ridges. If there were smooth level highways, omnibuses would only have to be provided with wheels wider at the rim in order to answer all the purposes of tramway-cars, without monopolizing the beat part of the road and thrusting all other traffic into the gutter. It is the greatest mistake in the world to suppose that it is only the carriages of the upper classes that suffer from tramways. All sorts of traffic suffer in at least an equal degree, and the majority of the vehicles in the streets belong to people of the lower and middle class who are engaged in trade. On some of the suburban tramway lines there are tramway-cars following and meeting each other at intervals of a few minutes. Any one who attempts to drive along the middle of the road has to take his chance of being roan down by the cars, or of lawing a wheel wrenched of by the rails as he tries to dodge aside, now on the left hand,

now on the right. Strict adherence to the rule of the reid is of course impossible. There are usually corn and corrispes standing by the kerb, and there is no room for any sue to pass between the standing traffic and the framway rails. It is not merely annoyance and inconvenience which are thus emised, but positive danger. On certain days of the week when droves of sheep and cattle pass along the chief thoroughfares of floath London, cattle, tramways, and general traffic are mixed up, together in the most hopeless confusion, and pedestrians have to struggle for the pavement with sheep and bullocks trying to escape from premature alsughter under the wheels. There can be no desipt that for many people tramway-cars are a great convenience. They are cheap, roomy, and comfortable to ride in. But if the roads were better, all amnibuses might be constructed after the fashion of the tramway-cars. We might also perhaps expect some improvement even in those atrodous cabs which the Chief Justice denounced so vehamently the other day. We hope therefore that granite is doomed. As to the relative merits of asphalte and wood we have nothing to say. The wooden paving in Piocedilly and also on Ludgate Hill is, as it stands, almost a rear parfection as anything of the kind can be; but it has only been laid for a short time; and it cannot be forgotten that former experiments with wood were not thought satisfactory. It is said that with proper attention the slipperiness of asphalte may be prevented. In Paris it does not appear to be bad for the horses; and perhaps in London some means may be discovered of remedying this defect. It must not be supposed that everything is known about shoeing horses; and it stands to reason that horse-shoes adapted to the unnatural

some means may be discovered of remedying this defect. It must not be supposed that everything is known about shoeing horses; and it stands to reason that horse-shoes adapted to the unnatural roughness and inequalities of granite are not exactly suited to a smooth, level road in perfect repair.

There could hardly be a greater boon to the people of London than a diminution in the noise of the streets. The luxury of those short peacoful gaps where the wheels roll softly over wood or asphalte, having once been known, will surely not be lightly surrendered as impracticable. After a time, no doubt, most people in town get used to the din of the streets; but it is very trying to persons of a nervous temporament, and there are probably many who are affected by it without being conscious of the cause. In the principal thoroughfares it is impossible to enjoy domestic quiet without double windows, and in some City offices the thunder of the traffic almost drowns the voices within. The doctors could probably tall us how much the fret and worry of London life are enhanced by the irritation of perpetual noise; and the jolting of springless cabe. us how much the fret and worry of London life are enhanced by the irritation of perpetual noise; and the jolting of springless cabs over rough stones is not particularly calculated to revive a weary frame. London is becoming a magnificent city, and it is surely time that a systematic effort should be made to render it a more agreeable place to live in. The administration of the City is, on the whole, creditable. The streets are well tended. They are thoroughly cleaned in the early morning; and there are street orderlies continually on duty during the day to sweep away fresh gatherings of dirt. In the rest of the metropolis, however, the streets seem to be left pretty much to themselves. This winter we have had no snow; but of course snow might reasonably have been expected, and everybody knows that, if it had come, all the arrangements for keeping the streets decent would have instantly collapsed. The victims of local misgovernment would have had to wade along the pavement through deep slush and mire, and, if compact. The victims of local magovernment would have had to wade along the pavement through deep slush and mire, and, if they wished to cross the road, would have found it necessary to scale huge embankments of mud and snow on either side. The year before last there were mountains of snow in Belgrave Square a week after it had fallen; but it seemed to be nobody's business to cart it away. Even a day or two's rain is enough to turn some parts of London into a slough of despond. In Bronnuton and Kensington the wat mud lies in lakes for days conther enough to turn some parts of London into a slough of despond. In Brompton and Kensington the wet mud lies in lakes for days together. In Piccadilly of a morning you may see a little band of the lame, the halt, and the blind, turned out from the workhouse to go through the farce of pretending to sweep the readway. Later in the day, if there has been a really serious accumulation of mud, an old man comes forth with a sweeping-machine drawn by a horse, and proceeds to plough the dirt up in furrows, which are then left to harden. The judgetity of water wavenesses and the carried to the state of the same transfer. plough the dirt up in furrows, which are then left to harden. The imbecility of vestry management could scarcely be typifled more strikingly. A considerable sum is annually spent on so-called cleansing operations, which leave the streets in a disgraceful condition; but, if proper arrangements were made, a very little more expense would enable the work to be done thoroughly. It might almost be supposed that there was a special clause in the contractors' agreements exempting them from any responsibility in regard to accumulations of mad and snow. As a rule, the dirt the rain brings is left for the rain to wash away. We do not know how it may be in Paris at the present time; but under the Empire the management of the principal thoroughfares was certainly excellent. Everything was carefully provided for and nothing left to chance, and no money was spared to do the work efficiently. No doubt there were plenty of dirty streets in the background, but still it was something that the best parts of Paris at least were kept in such good order. If the people of London have no regard for their own comfort, self-respect should make them anxious to present a respectable appearance in the eyes of have no regard for their own comfort, self-respect should make them anxious to present a respectable appearance in the eyes of the foreign visitors who every year flock hither in greater numbers. London is becoming more and more the centre of the world, the rendezvous of nations, and should make up its mind to cultivate the amenities. It will of course take time before we can have smooth and noiseless readways, but there is at least no reason why such reads as we have aloudd rat be kept decently clean.

THE QUEEN O' SCOTS.

THE beautiful and unfortunate Mary Stuart will always excite popular sympathy, which will not be diminished by any cogency of demonstration that she was less sinned against then sinning. Her story may be epitomized in the lines,

Beauty and anguish walking hand in hand The downward slope to death.

The downward slope to death.

An actress who has youth, good looks, and splendid clothes may trust herself to make an impression in this part without much aid from the intelligence of anybody else or even of herself. We shall perhaps best describe the play which has been produced at the Princess's Theatre by seying that it is a very superior specimen of what an American critic has called "the dry-goods drama." The play is in five acts, and Mrs. Rousby is in a corresponding number of lovely dresses. The author is Mr. Wills, who has already gained credit by bringing on the stage another handsome and unhappy, but not altogether faultless, member of the Stuart family. It cannot be objected to this play as to Charles I. that it contains only a single character, because the author has at any rate attempted to give force to the parts of John Knox and Chastelard. The latter part requires that which can hardly be found upon the stage—namely, an actor who is which can hardly be found upon the stage—namely, an actor who is young, good-looking, graceful, and fairly competent. When an actor reaches middle-life, he may know his business very thoroughly, but he cannot enact the youthful and ardent lover without some painful incongruity. It is conventionally assumed that clever women do not grow old upon the stage until they are very old indeed off it; but we are not aware that any similar understanding exists in

regard to men.
We do not know whether Scottish susceptibilities will be wounded by the repugnance of Queen Mary to exchange the climate and society of France for that of her native land. Her preference for Southern air has certainly been largely shared by her countrymen, and it must be remembered that she lived in France from her fifth to her nineteenth year, and then returned to Scotland to find herself a stranger to her subjects, without experience, without allies, and almost without a friend. At the gate of Edinburgh she was encountered by Knox's protest against the religion in which she had been brought up. Mr. Wills does not undertake in this play, as he has done before, to represent that all virtue was on the Royal side. The Queen confesses a passion for Chastelard, but by way of compensation Knox is made to over that the Queen's green and heavity have influenced him to a passion for Chastelard, but by way of compensation Knox is made to own that the Queen's grace and beauty have influenced him to momentary toleration of idolatry. The "temptation and weakness" of Knox might perhaps have been made impressive, but in fact they are slightly ludicrous. We think Mr. Wills's play might deserve to be performed, if that were possible, by an efficient company, but it would hardly be likely to survive a temporary indisposition of Mrs. Rousby. We believe that a play called Griscida, which was written for that lady, was actually performed in her absence, but perhaps the patience of the heroine of that play had imparted itself to the audience. Ordinarily the "dry-goods drama" must depend largely for success upon a combination of personal charms with handsome dresses and surroundings. It would greatly simplify a manager's duty if such a drama could be made to succeed entirely by artificial means. At present, however, nature must also do her part, and therefore we fear that Mr. Wills's play without Mrs. Rousby would be an utter failure. It is difficult for a play which depends so entirely upon one performer, to attain what may be considered nowadays a long run, and it is not likely that this play will be nearly as successful as "Twint" Are and Crown, in which Mrs. Rousely as successful as 'Twist Are and Crown, in which Mrs. Rousely first became known to Londoners. In dramatic as well as other history it is to be feared that Queen Elizabeth will triumph over Queen Mary. Mr. Tom Taylor's play contained many passages of great beauty, whereas Mr. Wills makes small attempt at literary success, to which indeed he had small encouragement.

There is beauty and feeling in Mary's furewell to France, and indeed the most pressic diction could not disguise the poetry of the circumstances. Mary had been at sixteen the dauphin's bride, and at eighteen the widow of the King of France. favourite device had been the two crowns of France and Scot-land, with the motto alianque moratur, meaning that she claimed also the crown of England. Henry II. of France died in July 1559, and in September of the same year Francis, Mary's husband, was crowned at Rheims. Mary was now at the height of her splendour, but it was doomed to be of short continuance. In December 1560 her husband died. By this event Catherine de' Medici rose again to power, and Mary, who did not reliah being second where she had been first, determined to quit France and return to Scotland. It would be rude to our Scotch friends to apply what Touchstone says of Audrey, "A poor thing, sir, but mine own." But it may be some mitigation of our sympathy with Mary at having to put up with Knox at home to remember that she 1559, and in September of the same year Francis, Mary's husband, mine own." But it may be some mitigation of our sympathy with Mary at having to put up with Knox at home to remember that she would have had to put up with Catherine in France, and it is at least conceivable that her beauty might have propitiated any man, whereas it would only have exasperated another woman who was not young, but probably considered herself handsome. It is quite intelligible that Mary, as soon as she had quitted France, wished herself back again, and exclaimed as she gased upon the fading coast-line, "Farewall! belowed country," For poetical purposes it is permissible to forget, as she probably forgot, that it would have been impossible for her to "get on," as ladies say, with Catherine de Medici. Doubtless the French Court would have been more tolerant of firtations with Chastelard or

other favousites than the make of Edinburgh, and on the other limit. Chastelard's influence might never have provailed if he had been only one among many gallaria of his nation who finitared round the Scottish Queen. Mowever, she arrives at Edinburgh, whome the "rejoicings of the people" are enacted after the usual stage fashion, and Knox makes himself very disagreeable without being particularly impressive. We do not feel that Mr. Rousby is called upon to trouble himself as well as us by attempting to talk looteh in the character of Knox. He confronts the Queen and points to a cross hanging round her neck, which he calls the "mark o' Babylon," and forbids her to enter the city while she weens it. We ought not to have forgotten that she arrives on a real live horse led by Chastelard, who holps her to dismount, and otherwise pays her ought not to have forgotten that she arrives on a real live horse led by Chastelard, who holps her to diamount, and otherwise pays her what they call in breach of promise cases "attentions." He is somewhat too forward, however, in rebuking the crowd, and Mary makes a great point by checking him with "No French subject shall ever dare dictate to my good Scotsmen." This sounds very line, but we soon become aware that, if the Queen governs Scotland, Chastelard governs the Queen. For the moment she successfully assorts her authority by saying, "Stand aside, John Knox, and let the Queen of Scotland pass."

In the next act Mary makes to Riszio a confession of her love for Chastelard. This looks like a violent improbability, which is not redeemed by either beauty or expediency. Chastelard overhears this confession, and thereupon performs those contortions of limbs and features which on the stage are supposed

tortions of limbs and features which on the stage are supposed to represent a lover's ocatasy. We really do not know how a gentleman of literary pursuits ought to look, or would look, on hearing a young and pretty Queen say that she was in love with him, and we can only pity an actor who is supposed first to know this, and then to be capable of representing it. Lord James Murray is brought upon the scene to help Kuox in heaping insults on the Queen, which of course Chastelard, like a true knight, resents. All this is merely what may be called the common forms of dramatic commonition and it is not redemend have a property of the state of the common forms of dramatic. composition, and it is not redeemed by any uncommon merit in the actors. The outery of the populace against Chastelard and the forcible entry of the mob, headed by Knox, into the chapel are just the kind of incidents in which managers delight. The "temptation and weakness of Knox" in his interview with the Queen requires a different kind of talent which cannot be hired in any required quantity at so much a night. There is nothing out-rageous in supposing Knox to be amenable to the influence of beauty, and the fact that he was married before Mary was twelve years old may for theatrical purposes be disregarded. A greater dramatist than Mr. Wills has made one of his characters excuse his own weakness by general example:-

What age, what sex, or what profession, Divine or human; from the man that cries For alms in the highway, to him that sings At the high altar, and doth sacrifice, Can truly say he knows not what is love?

The last act shows us the bedchamber of the Queen, into which Chastelard intrudes, but only to say farewell for ever. The Queen is augry, perceiving that this purely sentimental proceeding is likely to be unkindly misrepresented. It is to be feared indeed that victims of such misrepresentations are rather plentiful in the Divorce Court. Then a party of soldiers enters, headed by Lord James Murray, to whom the Queen appeals, "Brother, I love him. Dare you slay what your Queen loves?" Lord James Murray is equal to the occasion. John Knox also enters, and poses himself by the chimney in an attitude expressive, as we understand, of regret that he cannot soften the stern resolution of Lord James. Chastelard kisses the Queen's hand, and marches grandly with folded arms to execution. Then, after a pause, we hear a volley of musketry, and Mary falls senseloss to the ground. The last words of the play-bill are "Mary's only comfort." We must confess to some uncertainty as to what that comfort is, and we will venture to hope that it is not Rizzio promoted sice Chastelard defunct.

There is little in all this beyond ordinary playwright's work, and we do not think we do Mr. Wills injustice in saying that he has professioned that which he was destroyed.

has performed that which he undertook—namely, to write a play in which Mrs. Rousby might look nicely. A man is entitled to credit for having reached his aim, although it may not be a high The author has shown the skill of a practised hand in selecting one part of Mary's history which was capable of being simply and clearly treated. He could have written a better play, and his play might have been better acted, if he and the manager had thought it worth while to take the necessary trouble. But probably the play and the actors are good enough to fill the house until the dresses become shabby, and then some other play of equal merit may be forthcoming. Whatever we may think of the quality of the "dry-goods drama," there is no denying that in quantity it is capable of contenting us.

REVIEWS.

HAUREAUS HISTORY OF SCHOLASTIC PHILOSOPHY. OR more than twenty years M. Haurean has been known as a leading authority on the large and difficult subject of scholastic philosophy; but in the preface to this history, the first part of which has been recently published, he takes care to

Mistoise de la Philosophie scolapique. Par R. Maurien, Mambre de l'Institut. Première Partie. Paris : Durand et Pedoue-Leuriel.

ped as a second edition. d by the Academy, in mb

The first part comprises the period extending from the time of Charles the Great and his immediate successors, who originated those schools whence the school who are the classification of scholasticism; and, with the exception of Anselm and Abelard, few who figured in it will be recognised by those who are acquainted, at least by name, with Thomas Aquinas and Duna Scotus. Towards the beginning of the list stands Johannes Scotus Erigens, at the end stands Johannes Sarisburiensis—that is to say, John of Salisbury. These two men rather mark the limits of the pedigree of thought than belong to it; the first being a sami-Pagan, who had but small influence on his successors; the latter an accomplished scholar and man of the world, who looks but lightly on metaphysical subtleties, and takes a position in the history of philosophy not altogether unlike that of Cicero, whom he greatly admired. Between these the great personages are St. Anselm, William of Champeaux, Roscelin, Peter Abelard, Thierry and Bernard of Chartres, and Gilbert of La Porrée.

The controversy of the period is between the Realists and the Nominalists. With the latter party M. Haursau professedly agrees, but he sympathizes with both when they are persecuted by the Church, whose position towards mediaval philosophy often appears capricious in the extreme. His great merit, however, con-sists in the fulness of his information and the lucid manner in which he arranges it. Exceedingly well compiled is a chapter in which M. Haureau shows the amount of learning accessible to the schoolmen of the period to which his first volume refers. Those who now learn for the first time that for some three centuries a war was furiously waged between Peripatetics and Platonists will naturally suppose that the combatants were well posted up in their Aristotle and their Plato. Precisely the reverse was the case; and it is this circumstance, not the desire to produce two symmetrical volumes, which causes the History of Scholastic Philosophy to fall into two sharply defined parts. Greek never flourished at all among the schoolnen, save in some exceptional instances, as in that of the Irish Johannes Scotus Erigena; but in the second or classical period, with which we are not at present concerned, the great leaders of thought, Alexander of Hales, Albert the Great, and St. Thomas, Aquinus were in posssion of Latin translations of the greater part of Aristotle's works, and of the Arabian scholia. But there was no such intellectual treasure in Christian Europe during the period which intellectual treasure in Christian Europe during the period which ends with the twelfth century. Plato, there is every reason to believe, was known solely by his *Timeus*, represented by the Latin version of Chalcidius. In the ninth century the Lagoge of Porphyry, translated by Marius Victorinus, with a commentary by Boethius; Aristotle's book *De Interpretations*, translated by Boethius, with other treatises by the same Latin author, and the abridgment of the Categories, attributed to St. Augustin, and mistaken for a translation, formed the whole of the touth continue of the continu Peripatetic library. Towards the end of the tenth century a translation of the Categories by Boethius took the place in the better schools of St. Augustin's abridgment, but was by no means generally known. The historian Richer, who about 485 attended the lectures of the celebrated Gerbert (afterwards Pope Silvester II.), at the school of Rheims, then recently restored, thus describes the course pursued, which no doubt comprised everything on the subject which was attainable:—

Dialecticam ordine librorum percurrens dilucidis sententiarum verbis enodavit. In primis enim Porphyrii Isagogas, id est Introductiones, secundum Victorini rhetoris translationem; inde etiam casdem secundum Manlium (Boëthium) explanavit. Categoriarum, id est, Pradicamentorum, librum Aristotelis consequenter enucleans, Peri Ermenelas vero, id est, De Interpretations, librum cujus laboris sit aptissime monstravit. Inde etiam Topica, id est Argumentorum sedes, a Tullio de Graco in Latinum translata et a Manlio consule sex Commentariorum libris dilucidats, suis anditoribus intimavit.

Nor for nearly two centuries was the store of Peripatetic lore increased. Abelsid indeed mentions the Physics and Metaphysics, but it is evidently on the authority of some early writer, for he adds, "Quee quidem opera nullus adhue translator Latine lingue aptavit"—a euphemism which of course denotes that they were not accessible at all. The belief that Cicero's Topics were translated from the Greek was common in the middle ages. The logical works of Hoëthius, it may be observed, were of the greatest importance, insamuch as they comprised in an abridged form nearly all the parts of the Organon. Other writers known in the earlier period of Scholasticism were Marcianus Capella, an author of the fifth century, who wrote a strange book on the "Liberal Arts"; Cassiodorus, who belongs to a somewhat later time, and Pseude-Dionysius, whose mystical works were translated from the Greek by Johannes Scotus Erigens, and who for many years was believed to be Dionysius the Areopagita, the contemporary of St. Paul: physics, but it is evidently on the authority of some early writer, rary of St. Paul.

But this treasury of erudition, seasty as it might be, was more that shufficient for its purpose; since the whole controversy which agnited the schoolmen of the sentier period may be traced to a few lines in the League of Posphyry, which is now invariably reprinted with the works composing the Copymen of Aristotle. Additionable his pupil Chryssoms, Pupplyry distince that, although he prepared to give him an adequate distinction of genus, difference, species, preparty, and accident (afterwards called the five pre-

disables), he does not intend to state, with respect to great and species, whether these subsist in more conception entry whather, if it he otherwise, they are compared or messpecial; and, finally, whether they subsist in or spect from smallle objects. The questions thus left unasswered by Ferrityry produced a mass of disputation, which, leating six centuries, assumed altogether inexhaustible. If answers were not to be found in the Imagoge, answers must be devised. So far all the schoolman were acreed. From the difference of the answers the great heatin between Realism and Nominalism arous. between Realism and Nominalism aross.

The second question may here be passed over. It is by their answers to the first and third that the schoolmen are divided into hostile camps. He who is of opinion that the "Universels," as we may as well call them, exist otherwise than as mental abstraction is a Realist; a moderate Realist, if he holds that they only exist in sensible objects; an extreme one, if he holds that they have an existence apart. He who is of opinion that the "Universals" are mental abstractions only, or merely correspond to words, is in the first case a Conceptionalist, in the second a Nominalist per college. The difference between these two cases is one of detail, not of principle; and M. Haur'au uses the word Nominalism to comprise them both. It may be doubted indeed whether, with the doubtful exception of Abelard's preceptor Rescaliu, who has left no writings behind him, a single extreme Nominalist is to be found during the period now under consideration. Asse "Universals" more or less real than Individuals? According to the answer given by a philosopher to this broad question, he is regard by M. Hauréau on one of the two opposite sides, without regard to minor distinctions. For instance the instance of the two opposites in the instance of the two opposites in the instance of the two opposites in the instance of the i regard to minor distinctions. For instance, the inquiry whether the eternal ideas according to which the sensible world is created exist in the Divine Lutelloct alone, or form an intelligible world apart from the Deity, is one of detail, merely distinguishing two sects of Realists.

During the first period of Scholasticism, Reelism, though it mot with a rebuff in the person of Gilbert of La Porrée, who appears late in the scene, seems on the whole to have been more in favour with the Church than the rival system; and it is somewhat curious that the objection made to it by William of Ockham, the great Nominsliat of the second period—"Non sunt enths sine necessitate multiplicands"—seems to indicate that the real danger of the doctrine is not recognized by its most distinguished adversary. If to every abstract notion that the human mind can form there is a corresponding reality, a veritable substance, the number of independent entities threatens to become infinite; but it is not actually in a direction towards multiplicity that the possible heterodoxy of Realism lies. Under this apparent multiplication, as M. Hauréau shows, was concealed the opposite tendency to absorb not only individuals, but species and genera, into "one supendous whole," of which it could scarcely be said that there were any "purts." The advanced Realists, Thierry and Bernard of Chartres, who The advanced Realists, Thierry and Bornard of Chartess, which is divided by a very line line from that of Spinoza; and the great Jew of Amsterdam might have sung as an evening hymn these lines respecting the Deity, bequeathed by Hildebert of Lavardin, lishop of Mans, and afterwards Archbishop of Tours, who lived somewhat earlier:--

Supra cuncta, subter cuncta, Extra cuncta, intra cuncta, Intra cureta, ner inclusia. Extra cuncta, nec exclusus, Supra cuncta, nec clatus, Subter cuncta, nec substratus, Supra totus, providendo, Subter totus, sustinendo, Extra totus, amplectondo Intra totus est implendo,

It is edifying to learn that this Archiepiscopal Pantheiat had several mistresses, was the father of many children, and wrote elegant verses on licentious subjects; also that officially he was a zealous defender of the faith and a fleron antagonist of heretics.

One of the most complete and peculiar systems of Realism was that propounded in a commentary on the treatise De Trinitate (falsely ascribed to Boëthius), by Gilbert of La Porrée (Gilbertus Porretanus), who lived in the twelfth century. It is described with especial minuteness by M. Hauréau, who in this respect has done especial minuteness by M. Hauréau, who in this respect has done good service to the history of philosophy; for although Gilbert was almost the only thinker of his time who was remembered with respect in the second period, he has been neglected by the moderns who have recorded the progress of Scholasticism. According to his view, everything in the phenomenal world is composed of matter and form. But, with respect to form, distinctions are to be made. The first form is the vary armount of composed of matter and form. But, with respect to form, or tinctions are to be made. The first form is the very exence of the Beity; the second belongs to the veritable substances, which are fire, air, earth, and water; thirdly, the word "form" denotes the essential principle of existing things, as, e.g. "corporaty" (corporalitas) is the form of all bodies. The fourth and last form is that peculiar to individual phenomena. The four fundamental ideas—that is to say, the Empedoclean elements—are not united to bodies, but dwell apart in a superior region, being to the images of thincs what an original is to its copy, these images being forms of things what an original is to its copy, these images being forms been of forms. The forms of individual things are to be called "forms natives," that they may be thus distinguished from those that am eternal. Even a form of the third order, like corporaity, which is the universal ensence of bodies, is not to be regarded as pure, since it enters into composition with matter.

The relation of the universal to the individual subject was oddly illustrated by one of the stanschest of Reulists, Bernard of

Chartree, and the illustration is thus described by John of Salisbury:—

Ex opinione plurium idem principaliter significant denominativa, et es a quibus dominantur; sed consignificatione diversa, alebat Bernardus Carnotensis, quia albedo significat virginem incorruptam, albet sandam introductam thalamum aut cubantem in thero, album vero eandem sed corruptam.

The superior importance given to the abstract substantive above adjective and verbal forms is eminently characteristic of the Realists. Their patriarch, if we may so call him, Johannes Scotus Erigens, who understood Greek, thus names the Categories of Aristotle:—σύσια, ποιότης, ποσότης, πρός τι, ειδθος, είτς, τόπος, πρόνος, πράττειν, παθείν. In the Categories these names are:—σύσια, ποίαν, πόσον, ποός τι, ποῖν, ποτί, ειδθίαι, έχειν, ποιείν, πάσχειν. The only Category that is expressed by a substantive is οὐτία, and in the next chapter we read that the being par axcellence is the individual substance, which can neither be predicated of nor inherent in another substance, as τὶς ἀνθρωπος. It was this identification of reality with individuality that caused the early Nominalists to regard themselves as genuine Peripaticians. Those who have read the Metaphysics of Aristotle, which they had not, may feel inclined to doubt whether he was quite so much of a Nominalist as he seemed to be seven or eight centuries ago.

may feel inclined to doubt whether he was quite so much of a Nominalist as he seemed to be seven or eight centuries ago.

To return to Gilbert of La Porrée. Following the course pursued by the human reason in the investigation of truth, he says that, in the first place, man, by his senses, perceives matter and form closely connected with each other; then, by an operation peculiar to himself, he abstracts and abstractedly considers (abstraction considerat) the degenerate forms which in their "native" state are united to bodies. These forms, however, abstracted though they be, are not pure ideas, though they represent them in the human intellect. After the work of abstraction is ended—and here comes Realism—reason contemplates the ideas which she has abstracted in their eternal condition, and is thereby satisfied. The senses have made her acquainted with the perishable composite; she has acquired, by means of abstraction, the notion of separate form, and she has raised herself to the contemplation of pure truth.

she has raised herself to the contemplation of pure truth.

That which is general, according to the same system, precedes the particular. From the genus quality proceeds, for instance, the species rationality, which, united to other species, such as animality, &c., constitute the human species. Thus we have simple and compound species, of which the former are the ton Categories, and under all the species are the individuals. Of these every one is singular, one thing not another, hoc, aliquid. If several individuals resemble each other in a certain respect, that which they have in common does not destroy their personality, but constitutes their similitude, or, to speak more strongly, their consubstantiality. Take, for instance, the individual Plato. The proprium of Plato is not to be found in any other individual, but the wisdom, the stature, the complexion of which the proprium is composed may be found in many others. An individual is, in short, an assemblage of consistent parts, with which no other assemblage can be identical, and none of the parts, although they are singularized by the combination, are truly singular, inasmuch as they can be found elsewhere than in the composite Plato. Individuals are substances (ôπô loraµivo), that is to say, they support accidents; but, in the first place, they must have the common attribute of being, and this is impossible unless they partake of a common essence.

this is impossible unless they partake of a common essence.

We have dwelt thus at length upon Gilbert of La Porrée, not because his doctrine would have been subscribed to by the whole body of Realists, but because it contains, as it were, a digest of all the views held by different thinkers of the school. We may remark, however, that the introduction of the four elements seems to be an intrusion on the rest of the scheme.

The following epitaph will show the estimation in which Gilbert was held by his contemporaries:—

by his contemporaries:—
Floruit et cunctis precelluit ille magistris
Logicus, ethicus hic, theologicus atque sophistes.
Qui quam facundus verbis fuit atque profundus
Bensu testantur bene qui legisse probantur
Illius in libris magni commenta Bocchi.
Hic alter recte dictusque Boethius ipse
Cum Gislebertus proprio sit nomine dictus.

The charitable reader must excuse the long "o" in "logicus"

and "theologicus."

On the Nominalism or Conceptionalism of the first period we need not expatiate. The great Nominalists belong to a later age, and the philosophical (as distinguished from the theological) opinions of Abelard are such as might be held by an ordinary English or French philosopher of the eighteenth century.

MOSSMAN'S NEW JAPAN.*

OF all that region of the earth, already much less extensive than one could wish, which still has the charm of mystery, Japan was certainly the most attractive province until very recently. It is little more than twenty years since Commodore Perry first broke through the cordon by which the Japanese had for two centuries protected themselves against foreigners. At that time next to nothing was known of the internal constitution of the country; the early negotiators had to feel their way in the dark, and to encounter the accumulated prejudices of many generations. However, European ambassadors managed gradually to force their acquaintance upon the natives, being considerably aided in the process by a judicious display of the powers of steam

* New Japan, By Samuel Mossman. London: John Marray. 1873.

frigates armed with rifled guns. Since that period the ch which has taken place is generally described as marvellous. Mr. Mossman assures us that "in one short generation the Japanese have schieved a position in the civilized world that the foremost nations of Europe took centuries to account plish; and now their national cry in the peaceful path of progress is Forward! Onward! New Japan, the land of the riging sun." According to this statement, it has only taken twenty years to teach a nation which was previously the very tipe of obstructiveness to talk the language of the New York Bereid. The wonder increases when we remark that the time is considerably shorter during which any really active intercourse has takes place. At half the distance of time we have mentioned, that is in 1862, the Mikado nut forth a proclamation denouncing intercourse. place. At half the distance of time we have mentioned, that is in 1863, the Mikado put forth a proclamation denouncing intercourse with foreigners, and directing his generals to decide upon the precise time "when communications with the ugly parbarians should cease." In the same year the buildings of the British Legation were blown up with gunpowder, probably at the instigation of the authorities; and it soon afterwards became necessary for a British admiral to shock humane members of Parliament by bombarding a city of 180,000 inhabitants. The most obvious effect of the foreign interference was to produce a civil war which was vigorously carried on for several years, and which did not end until 1869. The war, however, resulted in the destruction of a feudal oligarchy which had more or less governed the country for six centuries; a new system was introduced; and in the four years which followed we are told that the duced; and in the four years which followed we are told that the "political, social, and religious institutions" of the country have been regenerated. A transition which has taken several centuries in Europe has therefore only occupied about as many years in Japan. The result, assuming it to be accurately stated, is equally surprising if we look at it from another point of view. In 1868 the whole resident foreign population of Yokohama, the town where the great mass of foreigners was congregated, amounted to less than 600 souls. The number of foreign officials of all kinds employed by the Japanese in 1871 was under 400, of whom about 100 were living in the interior. The numbers have since increased rapidly. Meanwhile, however, the population upon which they had to act is said to be about 32,000,000, which exceeds the population of is said to be about 32,000,000, which exceeds the population of Great Britain and Ireland. Amongst other items in the cansus we are told that there were over 1,800,000 military, naval, and civil officials of various kinds, and over 400,000 ecclesiastics, more than half of whom were Buddhist priests and monks. That so large a mass of people, provided with an ancient organization upon so large a scale, should have their manners and customs radically changed in so short a time by so small an infusion from without pretty nearly passes the limit of the credible. Compare, for example, the effect which has been produced upon the native habits of life in India by a race in possession of the whole power of Government for several generations. sion of the whole power of Government for several generations. session of the whole power of Government for several generations. We know indeed that a great revolution is being gradually effected in that country; but we know also that it has been slowly brought about, and that to the present day European influence has in many respects scarcely penetrated below the surface of society. Everybody who properly estimates the extreme difficulty with which the substance of national life can be transformed, or who will also be investigation in the position of a furnament. will place himself in imagination in the position of a Japanese inhabitant of the interior, will be slow to believe that four years have there really done the work of centuries elsewhere. The hyperbolical language used by travellers certainly convinces us that a very remarkable change has taken place, and one which deserves a very remarkable change has taken place, and the winds describes to a suspicion that it can hardly have penetrated so far as is sometimes implied; and that the Japanese readiness in superficial imitation is taken to indicate more than can be fairly inferred from the facts.

Mr. Mossman's book is more calculated to suggest problems than to throw any light upon their solution. In fact, it is one of those books which do not imply much research in the writer, nor promise to repay the trouble of the reader. It reminds us of a kind of literature which appears in America on the occasion of elections, and which is known, we believe, as "Campaign literature." We are presented with what appears at first sight to be an elaborate biography of a popular hero, and which turns out to be little but a series of newspaper cuttings more or less skilfully stitched together. Mr. Mossman has probably availed himself of all the most obvious sources of information upon the history of the last twenty years in Japan; but, unluckily, the Japanese, who would be the best authorities, have not told their story to the world; and a great deal that was going on in the interior remains very unintelligible to the "ugly barbarians." He is, therefore, to a considerable extent thrown back upon newspaper correspondence giving the hasty views of an outside observer. A disproportionate space is given to the descriptions of "ovations" and various public ceremonials which were doubtless amusing at the time, but which have scarcely a right to historical commemoration. Moreover, the language is often alipshod, and not seldom absolutely ungrammatical. Mr. Mossman's English style may be sufficiently indicated by the passage which we have already quoted, and by the ingenious paraphrases which he has discovered for the harm hird. In a note that well-known phrase is explained as meaning "belly-cut"; but such a vigorous bit of vernacular is not allowed to intrude into the text, where the word is translated into "abdominal suicide." But, allowing for such faults, we may admit that Mr. Mossman has put together a tolarably well-arranged summary of recent Japanese history, so far as it revealed itself to foreign observers; and that his book may be

so the absence of any book showing closer

convising and greater powers of description.

Our best hope, in fact, is that it may suggest to some competent inserver on the spot the expediency of writing a thorough description of the strange revolution which is taking place before our see, and yet evades our scrutiny with such tantalizing concealant. A large number of Japanese youths have been studying in cription of the str eyes, and yet evedes our scrutiny with such tentalising concesi-ment. A large number of Japanese youths have been studying in Europe, and America. Some of them should by this time know snought of foreign modes of thought to be able to understand and gratify an intelligent curiosity. Mr. Mossman, though bound to be complimentary in his general language, makes a complaint which seems to imply that his own inquiries may have been pro-vokingly baffled. He tells us that the members of the Japanese Embers had every virtue account communicativeness. He suggests roungly based. Its tells us that the memoers of the Japanese Embassy had every virtue except communicativeness. He suggests, in a hopeless way, that their brains have probably a large organ of secretiveness, which will not be diminished to normal proportions for many generations. When any questions were put to these gentlemen as to their social, political, or religious history, they answered in a way which suggested either ignorance or unwillingness to reveal the truth. We venture to guess that some light may be thrown upon this statement by an anecdote recorded about mess to reveal the truth. We venture to guess that some light may be thrown upon this statement by an anecdote recorded about their stay in Washington. The Embassy appeared at their first reception in complete Japanese Court costume, with "satin purple underskirts, and rich black overskirts." The Americans, it seems, considered this dress to be grotesque, and the Ambassador became conscious of the feeling of his hosts, or possibly learnt to sympathize with it. Accordingly the rich costumes disappeared for the rest of the journey, and they ever afterwards presented themselves in that beautiful dress which has commended itself to European tastes—that is to say, black cloth coats and chimney-pot hats. We guess, therefore, that the Japanese fancied that people who saked them questions meant to ridicule them. They have appreciated with excessive keenness our advantages in They have appreciated with excessive keenness our advantages in mechanical skill, and possibly overrated the blessings of Western civilisation. They therefore fall into the characteristic error of civilisation. They therefore fall into the characteristic error of believing that we cannot possibly be sincere in admiring any of their fashions. They resemble lads at the critical age who are anxious to pass themselves off for men, and are offended by nothing so much as by any assumption of interest in their immature habits of thought. In fact, the matter of dress is only too characteristic. Japanese art is being appreciated in England, whilst it is falling into disrepute in its own country. The picturesque native dress is thrown aside together with some foolish customs. We may approve of the abandonment of the old practice of shaving the tops of their heads, though there does not appear to be any reason in the nature of things why a razor should not be tops of their heads, though there does not appear to be any reason in the nature of things why a razor should not be applied to the scalp as well as to the cheeks. But it is less satisfactory to hear that the soldiers are forced to ape the uniforms of the French, or that the nobles are abandoning their old magnificence of costume. One more element of the picturesque is plainly departing from the world. We are too familiar with the process. It seems at present to be a law of nature that where a higher form of civilization comes into contact with a lower, it either extirpates or degrades it. Savages disapwith a lower, it either extirpates or degrades it. Savages disappear; and the semi-civilized peoples assimilate themselves to the

more degraded ranks of our own society.

It is impossible not to fear that a similar error is at the bottom of many of those changes over which Mr. Mossman, and the newspaper Correspondents from whom he quotes, express unqualified exultation. All the external peculiarities of other nations have been adopted with surprising readiness. Railways and telegraphs and newsapers and steamboats and coal mines are making rapid progress. The old fendal nobility have converted themselves into Government officials. Some sort of Parliament has been formed, if indeed an improved Parliament has not been contrived, for it seems that in Japan all members are not allowed to make speeches. The Church has been disestablished with an ease and rapidity which may excite the envy of Mr. Gladatone. And yet it must be admitted that we cannot yet judge of the effect of such transformations. Will the State officials be able to take the place of the Daimios in the social order? What is the real meaning of the religious changes which have taken place? According to the statistics we have noticed there were a querter of a million religious changes which have taken place? According to the statistics we have noticed, there were a quarter of a million of Buddhist priests in the country. The Mikado appears to have acted as energetically as Henry VIII., and to have encountered far less resistance. This enormous priesthood was deprived at one blow of its State revenues, and told to look for support to the zeal of devotees. Celibacy was abolished, and the priests were allowed to wear foreign clothes. They are to be allowed to eat animal flesh, instead of confining themselves to fish and vegetables. Similar measures were adopted in regard to the old national creed, and reports have been spread as to the establishment of a new State. measures were adopted in regard to the old national creed, and reports have been spread as to the establishment of a new State religion which is to amalgament the Sintoo and Buddhist priest-hoods. Here, one would have thought, is matter for a whole series of revolutions. What do the true believers think of it? Are they inclined to support their priests or the Government? If they care nothing for their old religious, what is their state of mind about religion generally? Are they inclined to adopt some form of Christianity, or to become purely indifferent, or to take up with some strange hybrid form of belief compounded out of all their old superstitions and the new opinions derivable from foreign influence? Such questions certainly suggest much food for thought, but appearently we can only reply at present that we know nothing certainly about the matter, and that we must be content to wait and and LORD LYTTON'S PABLES IN SONG.

O reader who looks into these two volumes with any discernment can refuse to allow that Lord Lytton has many of the elements of merit which go to make up the success of a poet's work. We find ingenious thoughts, abandant imagination of the graphic if not of the creative kind, and a command of language so far above the common as to lead the writer into faults of excess. Nevertheless the coexistence of these elements is not enough to ensure the desired result. They are all there, but they fail of being rightly combined. We admit that the stories are well told, that the descriptions are nicturesque, and the reflections well told, that the descriptions are picturesque, and the reflections just; but we read the several pieces for the most part with little interest, and after we have laid the book down the general impression left on the mind is that our entertainment, notwithstanding the pains bestowed in providing it, has fullen out flat and unsatisfying. In one of the earliest in order of these faties there is many duced the description of a cannon which is loaded, pointed, and ready to be fired, but which does not give its fire because the ready to be med, but which does not give its are because to match is wet. The image is unhappily too well fitted for an application not intended by the author. The book itself seems to us to be in a like case. The metal is good, and the charge is good; and the aim is good; but the one effectual spark is wanting. Somehow it does not go off. There is so much that is praiseworthy in detril that we could almost wish to find ourselves. singular in our general estimate, and to set ourselves down as biassed by some peculiar obtuseness. But our business is to give a faithful record of the impression which the book does in fact make on us, and we find that we cannot describe it otherwise than as we have done. And to a certain extent we can see our way to accounting for the result, at first sight anomalous, of pooms in-geniously written by an ingenious author being on the whole dull. Some little time ago we had occasion to remark that the time for making fairy tales is past. It seems at least probable that the time for making fables is past also, and for much the same reasons. We are in this age painfully alive to the fact that beasts and birds, to say nothing of pots and kettles, do not exchange their sentiments in articulate language. And when thoughts and feelings which are essentially modern—as is the case with most of the contents of this work-are put into the mouths of these characters, if we may use such a phrase of a class including things without even the semblance of a mouth, we instinctively refer the action of the fable to the present time, and perceive an incongruity which might be laughable if it were sudden, but which being elaborate is tiresome. Moreover in several of these pieces not only the thought but the objects introduced and the surroundings are unmistakably and even obtrusively modern; for instance, when the various parts of a steamship's engines are represented as conspiring against the oil, with the result of an explosion that sends the ship to the bottom. The concluding lines of the piece, which are a good specimen, may be quoted here in anticipation of the place where they would naturally come in our subsequent remarks on the style and execution:-

Execution:

Deep in the buried boiler lives
(Pleased with his habitation)
A codish. And that codish thrives,
And finds the whole creation
(Pented on a perfect plan,
Perceived with pious pleasure
Even by a codish, when he can
Contemplate life with leisure.

There is another remark to be made on the general conception of these Fables. A shrowd observer has said that the fault of Fastern parables is that "birds and beasts are made to reason, instead of representing the passions and affections they really share with men." Here the fauna and flora of Lord Lytton's imagination are made not merely to reason, but to speculate. At the end of the first volume we have a versitled form, which can well enough hold its own notwithstanding the number that have preceded it, of the question to which all the questions of philosophy are reducible.-What does all the world mean? As thus:--

> To what end. O Time, dost thou from bright to sable turn The restless spheres of thy revolving hours? Whence slide the silver twilights in between. Dreamily shuddering? Say, what ist ye roll, Night-wanderers mute, in mystic vapour veil'd, That linger laden on the lone hill-tops, And pass, like sorrows with a tale untold? Who wrought the unimaginable wrong Thou callest upon ruin to redress. Thou moaning storm that reamest heaven in vain, Triumphant never, never long subdued, Beautiful anarch! Answer, morn and eve, Why to your coming and departing kiss Blush, wrapt in rosy joy, the mountains old? What happens nighest heaven, and unbeheld, To speed thes headlong from thy native heams, wild torrent cradled in the tranquil cold? O Time, dost thou from bright to sable turn

But all this is delivered by no human speaker, but from the beak of But all this is derivered by a cannot away with such an extension of the a solitary eagle. We cannot away with such an extension of the license of fable. Ferrier probably went too far when he said that all animals but man were "incarnate absurdities gazing on unredeemed contradiction"; but the speculative turn of this eagle seems to us an absurdity in the other direction which is made rather worse by being intensified in poetry. We cannot admit a transcendentally the inters one really fine time in being intensified in poetry. We cannot admit a transcendentally minded bird of prey, even though he utters one really fine line in

By Robert Lord Lytton. Edinburgh and London:

his opening burst of indignation against the men or beasts (it does not appear which) who live as slaves of custom:

Thus lose they all the lives they never lived.

Lord Lytton ascribes to his eagle not only the power of speculation, but also the peculiar intellectual emotion which goes along with it in the human mind, and this, so far as the stylk goes, with perfect seriousness. An eagle being in fact a highly organized animal with a will of his own, and by no means contemptable wits, there is just enough false plausibility in the suggestion to make one distinctly reflect that it is impossible. If a fabulist wants to introduce speculation, it is better to take inanimate objects, whose reasonings we accept without hesitation as belonging to an absolutely conventional world. We are not at all surprised when Omar Khayyam's discontented wine-jars give us their views of natural theology. And one of Lord Lytton's more successful attempts in these volumes is the poem entitled "Cogito ergo arm" "where a believe representing the ability wife fractification. sum," where a balance, representing the philosophy of free-will, takes up this formula as his text, and is soundly rebuked by the weights, representing the philosophy of necessity. sum up the position of extreme idealism very neatly:-The weights

Thou dost think, and so art? (State the truth as it is, Thou dost fancy thou thinkest, and thinkest thou art.

The controversy is ended by a deus ex machina in the shape of the police, who confiscate the weights and balance together as being false.

So far as to the matter and conception of the work. In the manner there is so much inequality that it is next to impossible to give any judgment on it as a whole. Lord Lytton appears to be an exceedingly facile writer, and we suspect he would write better if he were not so facile. He commands several styles up to a certain point, but pays for this versatility by a touch of the amateur's imperfection in all. Probably he might be an admirable parodist if he chose. Consciously or unconsciously he has come wonderfully close to Mr. Browning in one or two places. In the introductory stanzas of the first volume these lines occur: ductory stanzas of the first volume these lines occur:-

Yet here, but a step at the most, or two,
From the door of the well-known mill
(Which all the while must be near at hand,
For the sound of it follows me still)
I am lost in a forest whose glades expand
O'er me, before me, immense and dense;
Where shadow and sighing sound profound
Pour into my spirit a sense intense
O'd dinness and distance; and, turning around
And around myself, I no further buve got
Than the which of that mill, which, the more to confound
My confusion, I hear, the' I see it not.

This might be passed off on many readers as Mr. Browning's own. About a quarter of the volume distant in space and turning of leaves, but wide as the poles asunder in spirit, we find some verses on the model of Wordsworth's childish manner, which are more faithful to the original than the parody in Rejected Addresses, if not so amusing :-

A little child, scarce five years old, And blithe as bird on bough; A little maiden, bright as gold, And pure as new-fall'n snow.

Things seen, to her, are things unknown:
Things near are far away:
The neighbouring hamlet, next our own,
As distant as Cathay!

And these various styles are assumed and put off with a rapidity which is somewhat perplexing, and inclines us to wonder if the writer may not have some covert design of playing tricks on the public. The same facility of execution which has led him into these vagaries is probably also responsible for a certain dashing carelessness in detail that sometimes becomes a serious fault. Take the battleness in detail that sometimes becomes a scrious fault. Take the battlesome to which we have already referred for another purpose. The
action takes place at the critical point where a battery whose fire
carried the day has been posted. We are told of a gunner killed
by "a random shell." How could it be random at such a place?
The epithet would have been proper if, instead of falling in the
battery, it had gone over it a mile or so to the rear and then burst
among men in reserve or camp-followers. Then comes the "brazen
wh" of a announce of the country of of a cannon-ball, an object which never was brazen except perhaps in a happily obsolete conventional dialect which made brass stand for all metal indiscriminately by a false analogy from brass stand for all metal indiscriminately by a false analogy from the Greek and Roman poets, resting ultimately on no better ground than that at the date of the Homeric poems iron had not yet supplanted bronze in general employment. Again, the gunner's match is called "death's nimble adopt," a phrase to which we confess we can attach no meaning at all. These little matters have struck our attention within a few consecutive pages. There are also sundry roughnesses of metre and tricks of alliteration which might without difficulty have been avoided. But alliteration is a tempting instrument for a writer with an abundant vocabulary, and ing instrument for a writer with an abundant vocabulary, and Lord Lytton often makes it effective. The following is a fair

A child, as from school he was bounding by, Roar the wall of a carpenter's workshop found A lustrous shaving that lured his eye; And this treasure he timidly pick'd from the ground. The thing was tender, transparent, light, Silk-soft, odorous, vein'd so fine With rosy waves in the richest white, Rare damask of dainty design!

The "Instrous shaving" has the undesigned air of a grotesque

commentary on Mr. Helman Hunt's last picture. So again, the poet lapses into promic discursiveness by muce for metrical fluency; he seems to run on with his story and comm without remembering that he is writing verse.

The defects we have mentioned bring parts of Lord Lytton's workmanahip below the average of what we have a right to expect from a cultivated scholar. But his curious inequality has a favourable side also, and his merits when he is at his heat any very involvance side also, and his merits when he is at his best and very much above such an average as in most cases would be indicated by the faults we have found. We feel bound therefore to conclude by giving a specimen of his happier passages. He seems to us atrongest in descriptions, and we choose this of a sculptor's studio from the second volume:—

I Large was the chamber; bathed with light screne
And silence tuned, not troubled, by the sound
Of one cool fountain tinkling in the green
Of laurel groves that girt the porches round.
And in that chamber the sole dwellers were
Ideas, clad in clear and stately shape;
Save one, a prisoner, luge, uncouth, and bare,
Ifung fast in fetters, hopeless of escape,
And broken at the heart,—a Marble Block.
Even as a hero, in base ambuscade
Fallen; so, fall'n, and from his native rock
Borne here in chains, the indignant Marble made
No moan; but round, in dumb remenstrance gazed;
And, gazing, saw, surprised, all round him stand
The images of gods. With right arm raised,
Jove launch'd the thunders from his loaded hand:
A light of undulating lovelinesses. Jove launch'd the thunders from his loaded hand A light of undulating lovelinesses, Rose foam-born Verius from the foam; and, dree With dismal beauty, by its serpent tresses. Did sworded Persons lift Medusa's head: There paused a-tiptoe wing-capp'd Mercury: Apollo, penaive smiling, linger'd here: There stately Pallas stood, with brooding eye, Full arm'd, and grasp'd the egis and the spear.

After all there will probably be great differences of taste as to the general effect of Fables in Nong, and the best counsel we can give the reader is to look at them and judge for himself.

DRUMMOND OF HAWTHORNDEN.

I ALLAM, a critic not given to enthusiasm, Thomas Campbell, and Robert Southey, have concurred, with some variations in degree of praise, in giving Drummond a high place among the English poets who appeared after the close of Shakspeare's work and before the beginning of Milton's. It is a general belief that he greatly excelled as a writer of sonnets, and is second only to Shak-speare as a sonnet-artist. He became known as a poet while Ben Jonson was the recognized head of English literature. Jonson made a visit to Scotland towards the end of 1618, and was hospitably entertained by Drunmond for two or three weeks, including Christmas, at "classic Hawthornden"; so Sir Walter Scott has described the beautiful spot on the Esk, within easy reach of Edinburgh, where Drunmond, laird of Hawthornden, poet and keen but not noisy politician, passed a studious and epicurean existence. Drummond carefully took notes of Ben Jonson's conversations while he was his guest; he did not publish them; but more than sixty years after his death his son permitted the publication of a copy. The impression produced by Drummond's notes of the conversations is unfavourable to Jonson's character in respect of vanity and uncharitableness; and Gifford, Ben Jonson's editor, was moved by a biographer's wrath to denounce Drummond furiously for his truthful narrative. "Perverse and utterly absurd and buildeg-like attacks on Drummond for supposed malignity, not too strong a description of Gifford's invectives given by Dr. Masson. Hallam had previously said in a more judicial tone, "The furious invective against Drummond for having written private emoranda of his conversations with Ben Jonson, which he did not publish, and which for aught we know were perfectly faithful, is absurd; any one else would have been thankful for so much literary anecdote." And it so happens that Drummond's notes of his conversations at Hawthornden with Ben Jonson, his has living and appearance of nonternance. his free-living and censorious guest, are a treasure of contemporary anecdote and unconscious self-contession. Dr. Masson thus relates the editorial history of this remarkable document :-

the editorial history of this remarkable document:

In the 1711 edition of Drummond's Works (pp. 224-226) there was printed a very imperfect, though not unfair, compilation of Drummond's Memoranda of Hen's visit, under the title of "Heads of a Conversation betwixt the famous Poet Ben Jonson and William Drummond of Hawthornden, January 1019." This compilation, which the editors of that edition had thought sufficient, was all that was accessible for more than a hundred years and it was on it that Gifford, in his Life of Jonson, founded his perceive and utterly absurd and buildog-like attacks on Drummond for supposed malignity, &c. When Mr. David Laing began, in 1827, his examination of the Hawthornden MSS, in the possession of the Antiquarian Society of Scotland, he hoped to find the originals of the precious Notes among those MSS. In this he was disappointed,—finding only the empty envelope which had contained the Notes, and which here the inscription, "Informations and Manners by Ben Jonson to W. D., 1619;" but his further search was rewarded by discovering, in a miscellaneous collection of MSS, entitled. Adversaria, in the hand-writing of the Scotlish antiquary, specially between 1700 and 1710. From this transcript of the missing document, made by that antiquary, apparently between 1700 and 1710. From this transcript, hasded "Informations to M. D., soken he came to Scotland upon foot, 1619." He before ditted the long-lost relic, with valuable notes, in a pager read before the

. . . .

nary 0, 1832, and afterwards published IV., 241-270). A separate edition of ng, appea hospitat Reciety. Altograther, this is one or exvises in Literary History that have been use of his life-long labours and reserving.

After Jouren left Mawthounden, letters of nourtesy and admit After Jones left Hawthounden, letters of courtesy and admiration were exphanged between him and Drummond; and the latter acquitties himself of a small commission, wrote to Joneson, as to a literary King, "If there he also other thing in this country unto which my power can reach, command it; there is nothing a wish more than to be in the calendar of those who love you." This is the world's style; and doubtless Joneson's genius and fame were powerful attractions to Drummond. But Drummond, studying him in the flesh new all his uncounts and greating faults and for powerful attractions to Drummend. But Drummend, studying him in the flesh, saw all his uncouth and grating faults, and for his own conscience sake, eased himself by writing down the judgment of his heart of hearts on the great and grand Ben:—

his own conscience sake eased himself by writing down the judgment of his heart of hearts on the great and grand Hen:—

This is what he appended to his Memorands of Bon's visit by way of summary of the impressions which Ben's personal pressures and demeanour had made upon him:—"He [Ben Jonson] is a great lover and praiser of himself; a contemner and scorner of others; given rather to lose a friend than a jest; jealous of every word and action of those about him (especially after drink, which is one of the elements in which he livesth); a dissembler of ill parts which reign in him, a bragger of some good that he wantsth; thinking nothing well but what either he himself or some of his friends and countrymen hath said or done: he is passionately kind and angry; careless either to gain or keep; vindictive, but, if he be well answered, at himself. For any religion, as being versed in both. Interproteth best eavings and deeds often to the worst. Oppressed with phantasy, which hath ever mastered his reason, a general disease in many poets. His inventions are smooth and easy; but above all he excelleth in a Translation." This is, no doubt, a perfectly honestly summing-up of Drummond's impressions; he was quite entitled to put it on paper if he chose; and Hen Jonson's admirers ought to be the last to object to such frankness. At the same time it does come a little gratingly in the context of the interchanged letters between the two men; and, with all allowance for any temporary disconfort to Drummond as Ben's host, one cannot but see that his fastidious tastes and his literary predilections disqualified him for admitting to his liking, as fully as another might have done, such a buge creature as Ben, faulta and all. Perhaps also one can trace in Drummond's words something of the trritation of a Scot at the spretz enjaria patrier. Although he himself acknowledged the literary barrenness of Scotland at that time in comparison with England, and did not ever-estimate the exceptions that might be found in Sir William Alexand

Dr. Masson has quoted largely from Mr. Laing's copy of the conversations; these extracts are by far the most interesting part of his volume, and we wish he had given the entire conversations, instead of still leaving the reader to seek them in the Transactions of the Scottish Antiquaries' Society or the Shakespeare Society's

publications

Michael Drayton, the author of the *Polyolbion*, had some months before Jonson's visit sent Drummond a cordial greeting of sympathy and admiration as from a literary brother, and there thus began a warm epistolary friendship which ended only with Drayton's death. They never saw each other. In the year 1618, in which Jonson visited Drummond and Drayton opened a correspondence with him, Drummond was in his thirty-third year, Ben Jonson in his forty-fifth, and Drayton in his fifty-sixth. It was then but with him, Drummond was in his thirty-third year, Ren Jonson in his forty-fifth, and Drayton in his fifty-sixth. It was then but four years since Drummond had published his first poem; that was an elegy on the death of James L'a eldest son, Prince Henry, whose death made the future Charles I, heir; "Tears on the Death of Mæliades" was the name of the work. It had been followed by a volume of miscellanies, "Amorous, Funeral, Divine, Pastoral, in Somets, Songs, Sextains, Madrigals," many of them telling his own deep love-happiness, and deeper love-sorrow, when his mistress died; and lastly, in the preceding year, 1617, he had produced "Forth-Feasting," a poem of compliment to James I. on his visit to Scotland. A contemporary Scotch poet, Sir William Alexander of Menstrie, afterwards Earl of Stirling, who has left a poetic fame of about the same order as Drummond's, had followed James I. from Edinburgh to London, and hald office in James's Court, being a Gentleman of the Bed-Chamber and later, Secretary of State. He bruited the fame of Drummond, whom he dearly loved, among the London poets. "Little de you think," wrote Drayton to Drummond, "how oft that noble friend of yours, Sir William Alexander, that man of men, and I have remembered you before we trafficked in friendship." "That most excellent spirit and rarest gem of our North" had been Drummond's own description of Alexander. Drayton coupled Drummond and Alexander in eulogistic verse:— Alexander in eulogistic verse:

in cullogistic verse:

So Scotland sent us hither for our own
That man whose name I ever would have known
To stand by mine, that most ingenious knight,
My Alexander, to whom in his right
I want extremely. Yet, in speaking thus,
I do but show the love that was 'twist us,
And not his numbers; which were brave and high,
So like his mind was his clear possy.
And my deat Drammond, to whom much I owe,
For his much love, and proud was I to know
His peary. For which two worthy men,
I Menstrie still shall love, and Hawthornden.

Ben Jonson told Drummond that Drayton "feared him [Jonson] and he [Jonson] esteemed not of him [Drayton]," and that "Sir William Alexander was not half kind to him [Jonson], and neglected him, because a friend to Drayton." These were samples of Jonson's had tongue for his neighbours; the had tongue was still more strikingly exemplified in such speeches as this en

Inigo Jones:—"When he wanted words to express the greatest villain in the world, he would call him an Inigo"; and another on a batch of writers—"Sharpham, Day, Bekker were all regues, and Minahew was one; Abraham Fraunce, in his English herameters, was a feel; Markham was not of the faithful, i.e. poets, and a base follow; such were Day and Middleton."

Drummond of Houstorndon, the Story of his Life and Fritings, is, in Dr. Masson's treatment, the history of Scotland, lineary and political, from 1585, the year of Drummond's hirth, to 1649, at the beginning of which Charles I. was executed, and at the end of which Drummond died. We have taken the measure of Drummond's literary fame. He was also a writer of political traces, following politics in his library, greatly averse to all the changes amidst which he lived, but from prudence and a love of quiet outwardly conforming himself to inevitable changes. He spoulated and wrote at Hawthornden, and kept aloof in the main from the noisy outward world, and shunned the storm. Dr. Masson speaks very often of Drummondism as his political creed, and, in uncanadvery often of Drummondism as his political creed, and, in uncuraci-ous zeal for his hero, seems to treat it as an active power in politics. Thus it may have been some years after his death, when, as is often the case, admirors of the past got up a factitious interest in the writings, little heeded while he lived, of the cultivated Episcopalian and Royalist politician of Hawthornden:—

In rose, or just before the Bestoration, there was a new London Kaition of Drummond's Collected Poems. . . . In Scotland, of course, his reputation continued to be most cherished among those who looked back with affection on the political part he had taken. After the liestoration, when Episcopacy was re-established, these were no longer the suppressed minority, but the triumphant Tory party, in possession of the Government for Charles II., oppressing and persecuting in their turn the relies of the utira-Treebyterian Covenanters or Whigs, and robabilitating as well as they could both the properties and the momeries of Scots who had suffered for their Royal'sm. Hawthernden, one finds, had begun by this time to be visited on Drummond's account.

Altogether the Scottish Episcopalians in Queen Anne's reign were a very interesting and well-nurked portion of the Scottish population, scattered in the South and West, but numerous in the North and Northern Highlands, with many men of talent among them, and keeping up tradition, both political and literary, from the past of Scotumen of the type of "douce David Deans," The martyred monarch Charles I. and his skithful Cavallers; the beroic memory of Montrose; the horrible interregnum of Noll Cromwell and his crew of miscreants; the blessed Restoration of the july King Charles II.; the gallant Claverhouse and his splendid rough-ridings among the canting Whigs; confusion to the memory of the Dutchman; long life and better days yet for the King over the water; down with all sour Religion, and up with the right Church; such were the phrases and sentiments distinguishing the Scottish Episcopalians from the rest of the nation.

Naturally it was among these that it became a plous duty, seventy years after Drummond's death, to put forth a complete edition of his works, and assert his claims to be remembered even in the midst of the new Literature of Queen Anne's reign. At all events it was Bishop John Sage, the chief of the Scottish Episcopalian clergy of his time, that undertook this duty.

Dr. Masson's zeal and industry are well known, and, though it is

Dr. Masson's zeal and industry are well known, and, though it is difficult to account for his choice of Drummond of Hawthornden difficult to account for his choice of Drummond of Hawthornden for treatment in the same exhaustive and encyclopædic manner in which he has been so long engaged in presenting Milton, he has certainly produced an interesting and readable volume. There is so much of freshness and geniality about Dr. Masson that no work of his can be despised. The faults of style of his Life of Milton recur in this volume; and we wish he could be cured of his mannerisms and colloquialisms. Why will Dr. Masson persist in oftending his readers by such ill-chosen eccentricities as that Hen Jonson, journeying to Scotland, was "on the tramp northwards," or (Laud accompanying Charles I. on his coronation visit to Scotland) that, "whorever Charles went among his Scottish subjects, the red-faced little English Bishop was seen trotting at his tail." These are only two samples of numerous unhappy deviations of Dr. Masson into what samples of numerous unhappy deviations of Dr. Masson into what we can only call vulgarity and slang.

TRANSMIGRATION.

MR. MORTIMER COLLINS dedicates his latest novel to a lady of rank, "whom," as he writes, "all who desire 'the preservation of our religion and our loyalty to our Queen' must honour for her courage in their defence." To what display of courage he refers we are not told. Happily, in these times but very slight calls have to be made on the courage of any man, much less of any woman, in the defence of our religion and our Queen. The day were as a new course when Mr. Bradlauch with his honour The day perhaps may come when Mr. Bradbugh, with his hundreds of thousands, shall assemble outside Westminster to attack both the one and the other. But the sheemakers of Northampton have not risen yet, and we have no doubt that, if troubleds times came, they would rather stick to their last than to Mr. Bradbugh. came, they would rather stick to their last than to Mr. Bradlaugh. Nevertheless, free as is the Queen's person from any risk of violence, we cannot say quite so much of the Queen's English. On this the most outrageous attacks are constantly made, by writers too, like Mr. Mortimer Collins, who cannot plead as their excuse their entire ignorance of language. Mr. Collins is familiar with Greek, so far at least as to enrich his own tongue with the new words "psithurism" and "cheirognomy," and to variegate his pages with scraps of Greek quotation. He has also, we infer, read a good deal of English, for in a letter which he lately wrote to the Times, in correction of a misquotation of an English poet, he informed the world that "in-

Transmigration. By Mortimer Collins, Author of "Marquis chant," so. de. 3 vols. London: Hurst & Blackstt. 1874.

accurate quotation is a growing vice." He himself, by the way, is happily freer from this vice than most writers of the day; for when he wants to quote poetry, as he is a post as well as a novelist, he generally, if we are not mistaken quotes himself. It would be just as well then, since religion and loyalty are sufficiently safe from attack, if Mr. Collins would refrain from estentationsly praising ladies for a courage which there has been no room for displaying, and would himself do a little more for the preservation of our language, which is really in considerable danger. It may be the case, however, that he has his own particular set of readers for whom, as regularly as the quarter-day comes round, he brings out his three fresh volumes. Perhaps they have grown so accustomed to his big talk that, if he were to try to address them in words of common sense, they would one and all refuse to hear him. A story used to be told of an old Irish member of Parliament who at the first election after the great Reform Bill was informed that his new constituents were not great Reform Bill was informed that his new constituents were not to be addressed in the rough and roady language which had done well enough before. On the hustings accordingly he began, "Gentlemen, I appear before you—" But here he broke down, and could not, though he tried more than once, get a word further on in his speech. His case seemed desperate, for the "gentlemen" ware beginning to laugh, when, snatching a big stick out of a bystander's hand, he waved it round his head as if he were at the entrance to a fair, and shouting out "Here I am again, you black-guards!" was received with thunders of applause, and in his old fashion made a most telling apach. In like manners and in his old guards!" was received with thunders of applause, and in his old fashion made a most telling speech. In like manner, no doubt, if Mr. Collins or the Daily Telegraph, with which as a writer he has much in common, were to begin to use the language of sober common sense, if they did not themselves break down from long want of familiarity with it, yet it would be so badly received by their readers that they would not get a single round of applause. They would, if they had presence of mind, at once go back to their own style, and Mr. Collins would talk of "scintillus and scintillating flashes," and "wonderful blue eyes that scintilated a strange light," and "bright scintillating eyes," and "the hypnotic ocean," and the "phacsimbrotous sun." There is no chance then of such writers as these taking to good English or good sense. Even if they are capable of either one or the other, their literary Even if they are capable of either one or the other, their literary connexion lies all the other way, and neither religion nor loyalty can expect a man to disregard his connexion.

We should be surprised, however, if Mr. Collins's readers were content with so little variety in the fare he serves up before them. Every one who has read one of his stories has read all. His mode of making a story is of the simplest. He takes half-adozen heroes or so with vast appointes, and half-a-dozen heroines with appetites if not quite so yest, and somewhat more desirty, not with appetites if, not quite so vast, and somewhat more dainty, yet sharp enough. In almost every chapter he gives an account of what was eaten, and, like a preacher who has chosen a very long text and constantly repeats it in every division of his sermon, easily manages to cover a good deal of ground. Mr. Collins would perhaps show more dramatic power, though scarcely so much of that Conservative loyalty of which he is so proud, if he were to allow his characters a certain variety in the food they delight in It is not every one who has a relish for anchovy paste, nor does the inhabitant of every "stately yet riant building" call for rumpsteak and oyster sauce or Presburg biscuits. If he would rumpsteak and oyster sauce or Presburg biscuits. If he would only, in the next volume he writes, copy in on every tenth page or so the list of the dishes given at the various restaurants at which he may have lately dined, his story would be more lifelike and no less interesting. When he has filled up enough paper with his meals, he then by a display of his mathematics fills up a few pages more. For instance, he makes his hero in the third volume, when a boy at school after the "metempsychosis" he had gone through, thus show off his great knowledge. We quote part of the passage, as, though a show of mathematics in a sensational story is no novelty to the readers of Mr. Collins's novels, it may be to ours:—

Now I had intended to appear quite as great a fool as Algy, that we might remain in the same form; but this smuffy's man's insolence annoyed me. So I worked the immortal pons asinorum out in the very words of facilid, evidently to Glanville's annazement; and then I said:

"Euclid's demonstration is unnecessarily complex. Allow me to try

Δ c' n' B 0

Let the isosceles triangle A B C be laid on its opposite side as in A' C' B'. Then there are two triangles having their sides A B, A C, equal to A'C', A' B' and the angle B A C equal to C' A' B'. Therefore the remaining angles are equal, each to each; therefore A B C is equal to A' C' B', which is the same as A C B."

From his mathematics he will perhaps pass on to some tremendous fights and thrashings, where the people who have eaten all the dinners, and smoked the cigarettes, and drunk the mocha, always knock down those of whose eating and drinking we are told nothing. So regularly is this the case that it is quite easy at the beginning of any of his novels to find out who at the end of the story are to gain the day and to marry the numerous heiresses, by noticing whose eating it is that is told at length. Now and then indeed there is an excention to this rule in the case of some very noticing whose eating it is that is told at length. Now and then indeed there is an exception to this rule in the case of some very which do learl who is as fond of anchovy toast as the rest; but he in all probability will die punitent, after first slipping a cheque for one hundred thousand pounds or so into the hero's hand. A duel or two and a little quiet gambling can then be introduced, else three volumes would look like a pillow at an int, only half full.

The hero, of course, will break the bank, and when a friend comes in the next morning hard up for twelve thousand pounds or some such trifle, will tell him that "there here rolls of notes to the such trine, will can ham that "there are rolls of notes to the amount of twenty thousand lying about somewhere, and that the villain (his sarvant) can find them." Next may follow a discussion on "the metaphysic of music, which," according to Mr. Collins, "has never yet been thoroughly investigated." Thence a few remarks on "the greatest neuteric mathematicism" can essily lead to a subject in which Mr. Collins finds about as easily lead to a subject in which fir. Comiss hims approx as much pleasure as in writing about eating—namely, abuse of Mr. Darwin. Mr. Collins or his heroes demolish the great modern—we ought to say neoteric—naturalist with as much ease as they would a rumpsteak. It is admirable to think of a mind so comprehensive that it can descend to anchovy paste, and rise to the loftiest heights. We will give our readers a chance of rising with it:—

heights. We will give our readers a chance of rising with it:

I am of opinion that we do not yet half understand the philosophy and psychology of sexual completion. Our modern sophists are so anxious by prove the non-existence of God and the monkey ancestry of man, that questions of real importance are forgotten. A Universe self-created is far less imaginable than a creating Deity; a monkey made as a caricature of man is far more probable than the development of man from a monkey. The thing cannot be done. Even a Darwin could not be grown from the chimpanzee . . . and there could be no easier form of the experiment.

But, () ye philosophers and students in life, there is room for great discovery in connexion with the higher nature of man. It is not our relation toward the beasts that perish which requires investigation; it is our relation towards God, who created us in his own image. Just at this moment we have fallen on a time when sham science is rampant: when anything new is accepted by all the shallow thoughtless people whose minds have no real culture.

have no real culture.

have no real culture.

All that is needed, after he has shown his readers how infinitely Mr. Darwin is beneath them, is for Mr. Collins to introduce them to company which they can with good reason reverence. He is not the man to leave them for many pages together without the pleasing society of some man of title. His noblemen are often very wicked, it is true, but, wicked though they may be, they always, we are confident, "desire the preservation of our religion and our loyalty to our Queen." We like the abrupt manner in which we are introduced into their company. A chapter opens, and we suddenly find ourselves familiar with people of the highest rank, and familiar with their vices too. Thus the fifth chapter of the first volume opens in very big capital letters with "Planthe first volume opens in very big capital letters with "Plan-tagenet Aquila, Marquis of Creçi, was the descendant of a race whose men were always sons peur et sans reproche, while the women were generally sons peur only." This noble youth was living "with no perceptible income, except what he won at play," while so happily was he constituted that "the wildest dissipation did not affect his health. He was," as the hero of the story tells us, "the most perfect specimen of the human animal I ever knew." The Marquis of Creçi naturally leads to the "Creçi Arms Inn," where the landlord brings out "a quart tankard of silver, bearing also the Creçi arms, and full to the foam-kissed brim of that amber fluid which all Englishmen love." After a long description of this ale, which had been brewed the day the Marquis was born, we return to Lady Diana Creci, who was as delightfully wicked as the sister of Plantagenet Aquila ought to be. She leads the hero into a duel, in which he shoots the brother of the lady he was engaged to. As the hero himself is Sir Edward Ellesmere, Baronet, while the brother was a Captain in His Majesty's Life Guards, we are less alive to any little improprieties in the conduct of this sister of a Marquis, for we are so pleased at being in such good conveny that we can efford to put pleased at being in such good company that we can afford to put morality on one side. We should be glad, however, if Mr. Collins would keep to the immoral doings of high life and would be content to leave "the philosophy and psychology of sexual com-pletion," as he calls it, but half understood. Of all writers, he is the most offensive who, when he wishes to be indecent, pretends that he is philosophical. Mr. Collins, with all his airs of a philosopher, is never philosophical, and with all his fine addresses to "ye students of life," is at times shamelessly coarse. Happily, when he is very coarse, he is also very dull.

YEATMAN'S HISTORY OF THE COMMON LAW.

THE author of this—we cannot say volume, but instalment of a volume, describes himself as "of Lincoln's Inn, Faquire, Barrister-at-Law, Muthor of 'An Outline of the Practice of the Mayor's Court of London." He dedicates his work to Lord Mayor's Court of London.'" He dedicates his work to Lord Coloridge, "in admiration of his great powers of oratory and eminent judicial qualities." All this might look as if something serious was coming. So one might think from the first words of the title-page, that is, as far as the words "Common Law." We know a Common Law, a Common Law of England, but we begin to rub our eyes a little when we hear of a "Common Law of Great Britain," while a "Common Law of Great Britain," while a "Common Law of Great Britain and Gaul" fairly carries us into the land of puzzledom. We know very well what we have to look for when any part of early history gets into the hands of mere lawyers. Their arguments from their assumptions are commonly unanswerable; only their assumptions are commonly are commonly unanswerable; only their assumptions are commonly rubbish. As a rule they turn things backward; they assume for instance that the hereditary king must have been from the beginning of things, and that he must have enfeofied the

^{*} The History of the Common Lane of Great Britain and Good from the arliest Period to the time of English Legal Manuery. By John Pyra catman. To be published in four Parts. Pare L. Lindon: Stavens & 1874.

hereditary lord of the manor very soon after the beginning. But, once granting the assumptions, the line of reasoning from the assumptions is commonly pariect. To be save there is now and then room for such displays of pleasing simplicity as when Mr. Finleson, searching into the nature of Earls, is clearly a little surprised to find that an Earl's daughter in the eleventh century was not a Countess in her own right. To this kind of thing we are quite used; and we should not have been surprised, from the first words of the title, if Mr. of catman History of the Common Law had been something on the level of Mr. Finleson, though of course we should not have been surprised if it had been something a great should not have been surprised if it had been something a great should not have been surprised if it had been something a great deal better. Even when we got to the words Great Britain and Gaul, puzzled as we began to be, we really did not expect that a learned gentleman of Lincoln's Inn, dedicating his work to a Chief Justice, would have sunk so very nearly to the level of Mr. Keane with his round towers, of Mr. Kavanagh with Man's First Word, or of Mrs. Wilkes with her Ur of the Chaldees. Yet so it is. We do not know whether the dedication to Lord Coleridge is by permission or without permission, but we should think that if the Chief Justice gets as far as the first paragraph of the preface, he must be inclined to echo that most sensible question of Achish King of Gath, "Have I need of madmen?" That first paragraph stands thus:—

The Gallic Nations, the French as well as the British, would have lest direct proof of their ancient Common Law, but for the preservation by their kinsmen, the Welsh, in their Triads and Codes, of very considerable portions of it; to this source alone can we apply with certainty for a true account of it.

Directly after we get puzzled by hearing of

a magnificent collection of legal documents covering the whole period sub-acquent to the Norman Conquest of this country by Sweyn, the Dane, and from the reign of Richard I. to the present time, an uninterrupted series such as no other nation can boast of, and to much of which the French can claim an equal share with ourselves.

Then again there is an appeal to the French lawyers, whose attention is called to the common origin of their laws and our own; and French lawyers, and seemingly Frenchmen in general, receive the following compliment:-

Except that we possess the records, they possess even greater facilities for the enquiry than we do ourselves, for they are deeper students than we can pretend to be of their country's history, a history which is inseparably interwoven with our own; indeed, the nobler part of the French and British condition, as they have a common origin, have a common history and law, so should our studies be ever the same.

English writers on Common Law are less to Mr. Yeatman's liking. Mr. Finlason himself does not escape without a dig:-

Nor do we make any use of our own grand inheritance; worse than this, we do not simply ignore its existence; we deny it—so-called histories of ou Common Law are issued which affect to give to our Law an exotic origin and which describe our polished ancestors as ignorant barbarians—th course followed by Mr. Finlason, the latest editor of Reeve's English Law. -so-called histories of our

We must honestly confess that, on reading this, we had not the faintest notion what it all meant. We could conceive a sense in which, by a pretty hard straining of words, English and French law might be said to have a common origin. But what we really could not make out was the assumption, taken for granted as if there had never been any doubt on the matter, that the Norman there had never been any doubt on the matter, that the Norman Conquest in England was wrought, not, as we had always fancied, by Duke William of Normandy, but by "Sweyn the Dane." And now that we have gone more fully through the book, or at least through this its first part, we have, if possible, even less notion what Mr. Yestman is trying to prove than we had before we began. The works of the other writers with whom we have compared Mr. Yestman and the had before the adventure. man really have the advantage. Mr. Koane, Mr. Kavanagh, and Mrs. Wilkes are really the clearer. We do not believe that it was from Ireland that Abram set forth to go into the land of Canaan, but we see distinctly that Mrs. Wilkes believes that it was. Mr. Keane too tells us plainly enough that the round towers and other ancient buildings of Ireland were built by the Cuthites, which would be an intelligible proposition if only some one would tell us who the Cuthites were. And even with Mr. Kavanagh, we can see that he wants us to believe that human speech began by man uttering the letter O. But Mr. Yeatman does not bring us even to the stage of knowing what it is that he wants to prove; we only pick up something by the way, and the things that we do pick up are passing strange. We can see that he has a strong dialike are passing strange. We can see that he has a strong dislike to Saxons, and to everything that has to do with them; but the dislike seems to take two forms. Sometimes it seems as if there never were any Saxons at all; sometimes, if there were Saxons, that they were a very bad people; sometimes that they had no laws; sometimes that their laws were very barbarous; sometimes that they had no language; sometimes that they had no language; but that it is not worth studying; sometimes that all the monuments of their language are so many forgeries. The Uni-versity of Oxford is taken to task for having a professorship of so worthless a tongue, and Mr. Earle is taken to task on the of so worthless a tongue, and Mr. Earle is taken to task on the charge of being Professor of it—a charge in answer to which we must plead in mitigation that Mr. Earle has not been Professor of anything for a good many years. We gather further, from one of the extracts that we have made from the preface, that Mr. Yeatman had "polished ancestors," and that the other legal light, Mr. Finlason, has been so rude as to describe Mr. Yeatman's polished ancestors as 'ignorant barbarians." Now if the disputant's name had een Morgan or Powell we could have seen some method in all this, but when a man bears the English name of Yestman, and dates from the English town of Wakefield, the thing is keyond us. The Chief Justice of the Common Pleas, by dint of his aminent judicial

qualities, may perhaps see through it; laymen, and from the case of Mr. Finlason it would seem even lawyers also, must be content to memain in darkness. All then that we can do is to pick out

to memain in darkness. All then that we can do is to pick out some tithits to put before the amased eyes of scholars, some of the particular statements made by Mr. Yestman, without attempting to find out what is the general object which he is seeking to prove.

The thing is curious because, though Mr. Yestman gives no sign of any study of original authorities, and though both his classical and medieval scholarship seem of the very weakest, he shows a kind of reading, and, what is more, a kind of sharpness. We know what to think of a man who on two pages side by side sends us to "Poseidorus," "Xiphilon," and "Luciano Hercules Gallieno," and who goes on to say "we learn" this and that "from the testimony of Pearson, Creasy, and many authors." Or rather the testimony of Pearson, Creasy, and many authors." Or rather we do not know what to make of one who sends us to Luciano Hercules Gallieno, because we really cannot find in Lucian's Dialogues, where we naturally looked, what it is that Mr. Yestman has got hold of. We can find something about Hercules, and something about the Celts, but Gallieno quite befiles us. But with all this, Mr. Yestman seems now and then to have stumbled by accident upon some of the very points which modern scholarship has used to prove various things, but which Mr. Yeatman, with strange perversity, turns about to prove, we do not exactly know what, but certainly not that which they really do prove. Such a book as Mr. Yeatman's is really a useful warning to those who cleave to a confused nomonclature which they may use without harm to themselves, but which helps to lead others astray. Mr. Yeatman is quite sharp enough to see the inaccuracy of spreading the Saxon name over all England. But when he finds out that all Englishmen were not Saxons, instead of making the right inferonce, he bursts forth into all this wild talk about Saxons. As far as we can make out his meaning, he takes Englishmen to be Welshmen, can make out his meaning, he takes Englishmen to be Welshmen, and Saxons to be nobody can tell what. He shows another glimmering of reason when he says that, if all England had been held by Saxons, the land would have been called Saxony and not England. What would he have said if he had known the fact that "Saxonia," though a name very rare except in the mouths of Picts and Scots, is actually an older name of the land than "Anglia"? So Mr. Yeatman shows throughout the effects of finding out what is wrong, without at the same time finding out what is right. He gets to the Dooms of Ætholberht and remarks, "There is a great difficulty in respect to the language of these "There is a great difficulty in respect to the language of these Dooms. Bede tells us they were written in English, but these are written in the Saxon tongue, which we know very well to be entirely different." So directly after he comes to the West-Saxon laws, from Ine to Æthelred, which he says "are clearly written for the English; although in the title of them these monarchs are for the English; although in the title of them these monarchs are said to be Kings of the Saxons, yet in the body of the laws no mention is made of that people, and the articles are expressly compiled for the English." Now Mr. Yeatman would most likely under any circumstances have written nonsense if he wrote anything at all; but he could hardly have written this particular kind of nonsense if scholars had not allowed themselves to use the name of the part as the name of the whole, to speak of our forefathers, not as they spoke of themselves, but as Scots and Britons spoke of them. spoke of them.

So again if Mr. Yeatman had got up the history of the eleventh century, not from Ivandoe and Thierry, or at the best from Mr. Pearson and Sir Edward Creasy, but from the writers of the time, he could never have said that "modern historians have jumped to the conclusion that our laws were necessarily of Saxon origin, because under the Norman Kings they were so called, and because Edward the Confessor was a Saxon." For if he had ever looked at any contemporary writer he would have found out that such a phrase as "Saxon laws" was unheard of under the Norman Kings. But then neither would he have written in this way if the writers whom he quotes, and later writers than they, had taken care to avoid a misleading nomenclature. In short, Mr. Yeatman's book, wild and worthless as it is, is a memorable warning that words and names are of some importance, and that to use them in their right place is a sign, not of pedantry, but of love of

The English name has We must pick out a plum or two more. nothing to do with Angeln or with the Angli of Tacitus, but it has something to do with the Demos Angele in Attica, a Demos has something to do with the Domos Angele in Attica, a Demos of the tribe Pandionis, "from whom Pridain, the traditional loader of the British, may have come." "English, or the tongue of the Angles, must be the lost Ligurian or Llogrian language." Directly after it is Thracian; then it is Celtic, for "the Ligurians were descended from the Pelasgi, who were clearly a Gaulish people." Moreover, the Angles had something to do with the Greek "Ayyakor, perhaps, he hints, because they were looked on as angels or as messengers from the Gods. Wessex was not Saxon; in fact there never was any Wessex; it was West Anglia, and Alfred was a Regulus under a Danish Overlord. There is no Saxon literature: the Chronicles are a forgery; but on this head Saxon literature; the Chronicles are a forgery; but on this head we must really let Mr. Yeatman speak for himself:—

The Saxon Chronicle, and probably the few Saxon translations still axiant, were probably the work of but few hands—possibly all the writing of Marianus himself, for he is the only writer who is known to have used the barbarous language. For it is singular indeed, but highly probable, that the so-called Saxon Chronicle is the work of a young Irishman with the so-called Saxon Chronicle is the work of a young Irishman with the completed his leisure in writing Saxon, them an unwritten language, and compiling a history of the people in whose country he happened to solourn a stranger, finding them utterly without a history; and it is not improbable that he granulated it into the vernacular of that people. This would account

for there being no stages of Saxon, and it would account too for the crude nature of the performance and the respect which was paid to this Chronicle by Florence and those who copied from it; for no doubt the Chronicle was published during the life of Florence, though his copy was not. They may have been deceived by it, and believed it to be a grenuine history. It is clear that William of Malmeebury did not fall into the same error.

This, we think, is enough.

A SUMMER IN SPAIN.

OF books on Spain there is literally no end; and the introduction of railways has given an extraordinary impulse to the manufacture. As a rule, the traveller's temptation to rush into print diminishes with the increasing facilities of travel, for reasons that are sufficiently obvious. But things in the Peninsula invariably go by contraries, and it would seem that even flying visitors are beguited into following the eccentric fashions of the natives. It is all the more odd, so far as book-making govs, since there is so much to discourage a modest Spanish tourist who aims at imparting information or originating thought. The Spanish cities have been ransacked in the departments of archaeology and history as thoroughly as ever were the various art collections by the hordes of brokers who followed in the track of the French Revolutionary generals. The show scenes have been described to satiety, and the buildings have been reproduced indefinitely in photographs more or less admirable. Each year there is less and less left to be written, as time and modern enterprise carry forward the work of destruction; so that if we desire a thorough knowledge of the vanishing relics of old Spain, we should turn rather to the books that were published at least thirty years ago. As it happens, the standard handbooks for Spain have been written by old residents in the country; men who went heart and soul into labours which were the fruits of years of patient travel. The indefatigable Ford gleaned pretty nearly all that was to be gleaned; and, in spite of his uncompromising views and his strong prejudices, we are very unlikely to look upon his like again. More recently O'Shea has followed him, and O'Shea would have made chimself an even higher reputation had it not been for the extraordinary merits of Ford. What is more, it is not on an ordinary tour along the high roads that you catch the local colouring of "the things of Spain," or pick up the quaint novelties that will give a value to your experiences. You must strike on horseback

much as possible out of the way of the contending factions.

The book she has written would have been very pleasant and useful had not all its chapters been anticipated by a variety of previous writers. Her style is graceful and lively; she has an artist's eye for effect, and shows good gifts of description. She took a very genuine interest in all that she saw, and discriminating enthusiasm is sure to awaken sympathy. But then we lay the volume down without being conscious of a single novel suggestion, and of scarcely a fresh impression; as, before we opened it, we had a sure presentiment of much that we should find within. We sak ourselves why each successive book-maker should feel bound to recapitulate that very venerable history of the nurder of Guzman's heir at the siege of Tarifa; or to dilate on the accident that tumbled Murillo off the scaffolding of the Capuchin church in Cadiz; or on that foul play to his Moslem guest by which the unprejudiced Pedro the Cruel appropriated the famous "balas-ruby" of the Red King. Are not all these things to be found chronicled at length in Ford? and where was the necessity for Mrs. Ramsay to transcribe them when Ford must still be the indispensable companion of every intelligent tourist? So with paintings. If we care at all for Spanish or Italian art, most of us are sufficiently familiar with the world-famed gens of the various collections, whether we have visited Spain or not. At any rate we know exactly to what authorities we may refer for elaborate details and cultivated criticism. And if we do not care for art, and know nothing of the Spanish collections, nothing makes duller reading than second-hand descriptions, summarized in a series of commonplace epithets of admiration. At the same time we must observe, in common justice, that Mrs. Ramsay in one most important respect has hit upon what may be called a decidedly original idea. She passed her "summer in Spain," instead of going there in the winter-time like almost every one size. A summer tour has its drawbacks u

* A Summer in Spain. By Mrs Ramany, Anthor of a "Translation of Dante's Dirina Concuedia." London: Tinaley Brokham. 1874.

when you would wish to be active if the sun would stiffer it. Still there can be no question that summer is the city season when you can appreciate the veritable characteristics of the Spanish people. No doubt summer makes sight-acting terrifly hird work in the cities, and the sudden charges from blasing Planes to chill interiors in ecolosiastical Gothic are far more dangerous than all the brigands in the Sierras. Dilliguage journeys in the dog days are something to be reasonbered indistinguage, with their choking clouds of warm chalk dust and this suffering makes the havens of refuge where there are shade and air doubly enjoyable, if you can only disabuse your mind of the idea that you must constantly be improving the shining house in galleries and churches. We fancy that by far the most pleasant time in Mrs. Hamsay's tour was passed in retreat at La Granja and in the Alhambra. In Granja was the favourite resort of Queen Christins, who had a very good teste in such matters, and the palace was the scene of the famous cong dited of the Sergeant Garcia. We can imagine the English ladies fresh—or rather fagged—from the dusty streets of the capital, appreciating in intense enjoyment the charm of that leafy oasis in the bleak Guadarrama. Nor could they easily have lighted upon more agreeable quarters, for La Granja has been very much described since the fall of the Bourbons, and they had the beautiful gardens as much to themselves as the wild forest. They were tolerably lucky in their accommodation too, finding themselves in a very decent little inn kept by a French family, and we must confess that such recent intolligence about the various fondas is among the most satisfactory reasons that can be alleged for the swift succession of works on subjects so tackneyed. But we suspect that Mrs. Itamasy's sociable manners and cheerful temperament had a good deal to do with her generally finding herself so comfortable. At La Granja she corrupted a venerable gate-keeper, having won the old lady's regard and affection by repe

Mrs. Ramsay speaks more dubiously as to the politeness of the Spaniards with whom she came in casual contact. The Castilian courtesy of high society justified its proverbial reputation; even the shopkeepers and middle clusses showed a dignified civility; but the plebs of the towns were offensively uncivil, and Murillo's street boys were more objectionable than Parisian gamens. Except for the beggars, who are persistent and obtrusive to a degree, and the boyish ragamuffins, who are much the same all the world over, we should have said Mrs. Ramsay was rather hard on the Spanish lower orders. But the truth is that ladies who are in the way of sketching in the open street offer temptations to incivility that are almost irresistible. The natives will gather to gape and stare at a spectacle so very unfamiliar, and they naturally assume that the artist is sketching in the way of business, and must take the consequences, if they do not attribute motives that are positively sinister. Free talk becomes coarsely offensive; one onlooker excites the other, and for our own part, if we consulted our comfort, we should beat a speedy retreat, could we conceive the possibility of our ever having served up our resolution to making so unusual a public appearance. At the same time, we have no doubt we should have appreciated the trophies of Mrs. Ramsay's trials and triumphs had she thought of illustrating her book more freely. We like her frontispiece and her vignette, and at least she paints very prettily in words when she chooses; na, for instance, selecting an example at random, in her description of the Seville fruit-market. Her picture of the piles of luscious melons encumbering the market-place—globes in green and yellow, in the rough and in the amouth, speckled, spotted, and all the rest of it—reminds us of one of the rapid studies of that most spirited but unequal Hungarian artist, Petitkoffen. Mrs. Ramsay has humour too; witness the account of her catching her friend's donkey, when he had broken away at Tangiers from the c

His had got into great spirits, and careered away much faster than could have been expected, considering the previous solemnity of his demeanous. He would not allow H. to come near him, having taken a dislike to her because she had ridden him. He did not object to me at all, thinking me a nice person who never rode doukeys, and who could therefore be trusted. After he was caught I had to hald and coax him while the doukey boy, by a sudden coap of samin, sented H. on her elevated position on the assidispack. I shall never forget the doukey's look of represental indignations when he found how he had been cheated.

The most original episode in the expedition was the journey by diligence from Cadis to Alpesiras. The ride is magnificent, expecially the last descent. It lies through superb cork freets, by leaping streams, with glorious views through the changing views down upon the bay and across to the opposite mountains. But we had never heard of there being a carriage road, and the citizens of Cadis were researchly scoptical as no the emissions of that or a diligence. The diligence turned out to be a fact, but the road proved a definition; at least it same to an end prematurely.

and the state of

dwindling into a more track which wound up the sides of the mountains. There was a bridge over a river that threatened to her their passage, but—cosa d'España—the bridge was impresticable, and the ladies had to pick their way across on stepping stones. However, they recovered the courage which had naturally been shaken as they found that nothing could most the difference, and of course the scenery repaid them for having roughed it. Generally, Mrs. Ramsay is ready enough to admire, but she describes it, things must have greatly changed for the wome of late years—which is very possible—but to our mind there are walks and rides in the neighbourhood that are scarcely to be surpassed anywhere in Spain. The tour was brought to a somewhat shrupt termination by the troublesome Carlist hands, who had taken to cutting the coast communications in Catalonia. It was with heartfelt satisfaction that the ladies descended one fine morning at the French*custom-house, their diligence, as it proved, having had a narrow escape from the guerilla partisans of the Catholic King. They had to give up the visits they had planned to Montserrat and to the magnificent monastery of Poblet, so admirably described by Mr. Hare in his recent volume of "Wanderings." But, on the whole, they had an extramely agreeable time of it, and we only wish we could believe that the story of their Spanish sojourn may prove as agreeable to the reader.

DOUGLAS'S CHINESE-ENGLISH DICTIONARY.

IN an Empire extending over an area as large as Europe, where locomotion is difficult, and where the inhabitants of the different provinces trace their descent direct through more than a hundred generations to the first Chinese settlers in the same districts, we ought not to be surprised to find that dislects abound, and that distinctive expressions and forms of speach are to be met with in every department. To such an extent have these divergencies of speech been carried in China, and so completely have they become hardened into fixed and recognized provincialisms, that for all purposes of oral communication the Chinese language might be reckeded as polycut, and the people as polygenous. A native of Pekin would have no easy task to make his wants known in the markets of Canton, and a visitor from Sze-chuen would find it difficult to render himself intolligible to his fellow-countrymen in Pokien. Thus it is throughout the Empire; the people of each province and even of each district have their own peculiar forms of pronunciation and of expression, which are only partly, if at all, understood by the neighbours who surround them. But in all this confusion of tongues these is one talisman which, broadly speaking, may be said to unravel every mystery and to explain every difficulty; and that is the written character. This is the same all over the Empire, and a paper and peucil are all that are required by any two educated Chimamen to reconcile even the widest differences of speech which may exist between them.

In the preface to the work before us Mr. Douglas rejects the word "dialect" as applied to the Amoy vernacular, for which he claims the rank of a distinct language. "Nor does the word 'dislect," he says, "convey anything like a correct idea of its distinctive character; it is no mere dialectic variety of some other language; it is a distinct language, one of the many and widely differing languages which divide among them the soil of China." As a proof of this he tells us that it is spoken by the learned as well as by the ignorant, and by the rich as well as by the poor. The written language he considers to be "rather a notation" than a language," since it "is pronounced differently when read aloud in the different parts of China, so that, while as written it is one, as soon as it is pronounced it splits into several languages." We cannot give our adhesion to this apprandizement of the various spoken dislects of China. No variation of a tongue which does not possess a written language and a literature of its own can aspire to be considered anything more then a dialect. Now it cannot be said that any Chinese author of note has ever made a dialect of China the whiche of his thoughts. And besides, speaking generally, the construction of the language is the same in every dialect, and the difference is to be found only in pronunciation. It is true that in some districts the colloquial names of things bear no resemblance in sound to those by which they are known elsewhere—as, for instance, the Chinese word "cha," "tea," is pronounced in Amoy "tê," whence is derived our English equivalent. But, as a rule, there is no such complete dissimilarity. This fact has emouraged Mr. Douglas to compile for general use a Distionary in which the Chinese words are transcribed in Roman letters, although at the most able of that body that with the unlearned reference in it is quite possible to dissociate the sounds of the words from the Chinese characters, and that sugar chuse withing these characters, and that sugar character to acqui

* (Risen-English Dictionary of the Verancelar or Spoken Language of Anny, with the Principal Variations of the Changeloss and Chin-chen Dictions. By Bay. Carstairs Douglas, M.A., L.L.D. London: Trübmer & Co. 1873.

is remembered, this statement appears quite credible, and doubtless the missionaries are right in adopting the readiest mode of imparting the truths which they desire to teach to the native mind. But a monoget's consideration is enough to point out many difficulties in the way of carrying out the scheme. Foremost among these is the infinite number of dislesse which exist throughout the country. Speaking breatly, no book published in any one dislect in the Roman character would be intelligible to people beyond the radius of a few miles from the place of imprint. It would be necessary therefore to publish separate editions of a work intended for circulation in any province, in every town and hamlet within its boundaries.

any one dialect in the Roman characters would be intelligible to people beyond the radius of a few miles from the place of imprist. It would be necessary therefore to publish separate editions of a work intended for circulation in any province, in every town and hamlet within its boundaries.

To show that we do not evaggerate this difficulty, we will quote a few words taken at random from the Dictionary before us, as pronounced at Amoy and at Chang-chow, towns thirty miles apart. Thus ping, a side, is pronounced in Chang-chow ping in the same way kun, a Chinese pound, is pronounced kin, and ching, posterity, ching. Again, the knowledge of the Roman latters thus applied opens to the intelligence of the active only these books-which are published by the missionaries. It neither helps him to become acquainted with the literature of his own constry, now does it in the least assist him in learning English. Experiences has proved also that it is impossible to represent correctly all Chinese words by English letters; and to meet this difficulty some scholars, as, for instance, the author of the Dictionary before us, have adopted signs to supply the missing sounds, while others have even gone the length of inventing a new and complete avenue of hieroglyphic writing to meet the emorphary. Under all those disadvantages, it is difficult to understand how any such system can answer. The missionaries, however, proclaim it to be a success, and their judgment is certainly entitled to consideration. The atrongest argument the urgs for its adoption is that a grant number of words in the difficent dialects are not represented in the written language of the country; but then the question arises—is it wise to eater for the religious appetite of the few who can be induced to learn an alphabet which is a key only to the books published by the missionaries, while a much wider circle might be reached by books printed in the native character? It is quite true that in countries like China, where the great manses of the upper and middle

ceeding than that now so largely adopted.

Certainly if any dialect in China is eatitled to be treated in a special manner, it is that of Amoy. It is speken by a population of about ten millions, and is the only tongue known to by far the greater number of the inhabitants of the island of Formesa, who for the most part are entirely ignorant of the Chinese written character. Mr. Houghe's Dictionary is the first which has been published in it, and we have no doubt that it will be found to be of great use to the foreign residents at Amoy and in Formusa. For it must be borne in mind that the volume before us does not belong into be borne in mind that the volume below its does not some for the that the class of works of which we have just been speaking. The intention with which it was compiled is described by Mz. Benglas in these words:—"My chief object has been to assist those who are ongaged in the work of Christian missions; but for this purpose I have endeavoured to give a full view of the language so far as have been able to learn it; and the book is fitted to be equally useful to merchants, travellers, mariners, interpreters, and students."

It is true that the Chinese words are expressed in the Roman character, and this will undoubtedly prove to be a great drawback to the usefulness of the Dictionary, since there must always be in such a language as Chinese a certain vagueness as to the correct meaning and uses of a word which cannot be at once identified by means of the native character; but the work is not intended only to enable illiterate converts to understand the missionary books published for their benefit in the Amoy dialect, but to help the foreign residents of whatever class or calling to a knowledge of This object Mr. Douglas's Dictionary is well cademated to effect, and to students of Chinese literature it will, as soon on the pronunciation has been thoroughly mustered, be found to be of great assistance. It is peculiarly rich in such expressions and phrases as are commonly to be met with in works of parentive and liction. For instance, under the heading Loo, a road, we find no fewer than one hundred and twenty-two examples of the uses of that than one hundred and twenty-two examples of the uses of that one word, and we need say no more to convince of its great usefulness every one who has had to contend with the difficulties which so often arise from the variety of meanings of which so many words are capable. Mr. Douglas holds out to us the hope that he may publish in a few years a key to the present work, in which he promises to supply as many of the Chinese characters as it is possible to identify. When this is done, it will, for all ordinary purposes, he the best Dictionary in the language yet published.

From an archeological point of view the atudy of the Amoy and other old dialects of China is highly important. By means of these we are able to make available the ancient syllakie spelling which was in use eleven or twelve centuries ago, and approximately to fix the sounds of the characters as they existed at that certify period. As has been shown by Mr. Editins, the native suther title on the subject point to the dialect spoken in the province of Chekeang as being more nearly allied to the ancient pronunciation of

the language than any which now exists, since in it are preserved the thirty-six initials and the four tones exactly as they appear in the early system of spelling. But in this the old finals m, k, t, p, which have entirely disappeared in the Mandarin dialects, are but imperfectly retained, and on this point the dialects of Amoy and Canton supply that which would otherwise be lost. To philological students of Chinese Mr. Douglas's Dictionary will therefore be of great value, since it helps to disclose the language of China as it was originally pronounced, and to decipher much which has hitherto been shrouded in obscurity. On the Buddhist literature of the country it has a direct bearing, and it enables us to trace in the Chinese transcriptions the names of Indian places and personages which, without a knowledge of the dialects it deals with, must always have remained vague and obscure.

BIDA'S ILLUSTRATIONS OF THE FOUR GOSPELS.

NO one who sees these two magnificent volumes can be surprised that M. Bida should have won a great reputation by his illustrations of the Bible. That these designs should be wholly satisfactory was of course not to be expected, especially considering the satisfactory which they come as school which certainly is not conschool from which they come—a school which certainly is not conspicuous for religious reverence, or even for the dignity and decorum which belit high and sacred art. Yet to compare these compositions with the Bible illustrations of M. Gustave Doré were to do them injustice. M. Bida, it is true, like M. Dord, must be regarded and interpreted as a product of the French soil—a soil rank as it is rich, prolific in weeds as it is fortile in good seed. draftsman brings to his work exceptional advantages; trained in the school of Delacroix, his style is picturesque and powerful; in the school of Deiscroix, his sivie is picturesque and powerful; his conceptions seize the spectator by surprise through their daring originality. Unlike the cold forms of M. Ingres and the serene aspirations of M. Ary Scheffer, these designs have warmth, passion, and tunuit. This great French designer, in common with our countryman Mr. Holman Hunt, has made himself familiar with the actual scenes described in the sacred himself familiar with the actual scenes described in the sacred narrative; hence his drawings are imbued with local character and colour; not only are they accurate transcripts of costume, but the vegetation is true as if studied on the spot, and the atmosphere glows as with Oriental heat and life. It will be thus seen that M. Bida belongs to the company of French artists among whom M. Horace Vernet was a chief; the ideal of Raffaelle he casts aside as foreign to nature; the costume of classic lands he discards as inconsistent with actual facts.

M. Bida believes in what he has seen and handled, but in little more; indeed we may almost suppose him to be in the mental condition of a celebrated anatomist who declared that he had never discovered the soul in the dissecting-room. This keen and incredulous Frenchman seems to be in somewhat the position of the eloquent M. Renan; in the Holy Land he has never seen a miracle, hence the supernatural is hardly permitted an entrance into his art; for him a Transfiguration or an Ascension is not so much an act of faith as a feat for the play of the dramatic faculty. M. Bida, like other Parisian painters his contemporaries, has too much offhand cleverness, too much worldly wisdom and saroir-faire, to rank as "il divino;" and yet, on the other hand, he shows himself too much of the true artist to treat a sacred subject with irreverence. It has been said that worship grows out of wonder; these designs reach the outer confines of wonder, but do not penetrate into the inner sphere of worship.

The text of Les Saints Evangiles is by Bossuct, and the illustrations, numbering one hundred and twenty-eight large plates, are etched from the designs of M. Bida by the most eminent living artists; the type, we are told, is cast expressly for the letterpress. rtists; the type, we are told, is cast expressly for the letterpress. The work has been twelve years in preparation, and we are informed that M. Bida "has spent a considerable time in the Holy Land studying the details of scenery, architecture, costume, &c., for the purpose of imparting a distinctive critical and historic accuracy." It will thus, as we have said, be understood that M. Bida belongs to that modern phase of thought, that school in art, which would realize the unseen through the senses, the supernatural through the particular the historic and the inverse through through the natural, the historic and the imaginative through

which would realize the tinseen through the senses, the supernatural through the natural, the historic and the imaginative through things present and actual. Accordingly, the most satisfactory designs are those which embody some tangible fact or picturesque incident, such as street scenes and interiors; for example, "The Calling of St. Matthew," and "Peace be Within this House." Among landscapes, "The Flight into Egypt," comprising cornfields, palm-trees, villages, pyramids, and distant hills bordering on the Nile, is a composition of great beauty.

As we look over these diversified designs we are impressed with two results incident to the artist's mode of study. The one is that this direct appeal to nature brings into sacred themes which had been well nigh worn out by the old masters an unlooked-for freshness, life, and reality. In olden times it is well known that Biblical subjects had their prescriptive treatment either imposed by the Church or fixed by tradition. Even the number of scenes in the series from the Old and New Testaments was limited. But to a modern designer, especially if he be a Frenchman, there are no bounds to the latitude allowed. We are reminded that an Evangelist has said that, if all the things which Jesus did were written every one, the world itself could not con-

tain the books that should be written; and we now seem arrived at a point when the pictures that may be painted shall, like the making of books, have no end. Indeed in these latter days an analogy would appear to have arisen between the multiplication of pictorial designs and the writing of sermons; we have heard of a preacher delivering six successive discourses on one text, and a similar fartility of invention is now morable to a raintage. similar fertility of invention is now possible to a painter; he may shift his point of view, change or multiply his figures, and alter his backgrounds almost at discretion. An artist who, like M. Bida, has day by day walked among the hills and valleys which the Saviour trod, will at every turn have found the suggestion of some new thought or accessory detail. On his way to Jericho, for example, he may have gathered the materials for one of the most example, he may have gathered the materials for one of the most picturesque and novel of these designs, wherein blind Bartimeus is seen sitting by the wayside begging. This plate, by the famous M. Flameng, is a fine example of the art of etching. Novel, too, but revolting, is "The Beheading of St. John." Altogether these designs, by their multitude as well as by their merit, go far to justify an observation we once heard made by an English traveller in an Italian picture-gallery—that the old artists had left untouched some of the most paintable of Biblical themes.

The second observation which the survey of these illustrated Evangelists suggests is that the naturalistic mode of study is, as might be expected, all but incompatible with a supernatural treat-ment. We know from personal experience of Eastern travel and its bodily discomforts, when perchance heat endangers a sunstroke, or wet threatens a deluge, or countless annoyances make the night sleepless, how difficult it is for the mind to soar and for the spirit to hold communion with the pest. No country is so disenchanting as l'alestine; instead of a land flowing with milk and honey, all that prophets have foretold of barrenness and desolation is realized to the very letter. And therefore it becomes a question whether the old Italians who had recourse to imagination, or these modern artists who study physical geography, climate, costume, and physiognomy on the spot, are in the more favourable position. The full of the nation at large has degraded each inhabitant; at the Jows' Place of Wailing, before the outer wall of the Temple—a scene again and again reproduced in our picture galleries—we have never observed prophets or apostles, but rather a class of broken-down Jows who have left the trade in old clothes in the West with the idea of ending their days among the sepulchres of their fathers. And in like manner, when we come to these illustrations, what do we encounter? Why, instead of doctors in the Temple, mendicants; and in place of apostles as ennobled by Raffaelle and others, we are introduced to a set of people who higgle in bazaars, or who enact the bandit in the highways. It is true that St. Matthew enact the bandit in the highways. It is true that St. Matthew was taken from the receipt of custom; but it is also true that he was baptized in fire at Pentecost. The problem which the religious artist has to solve is proverbially difficult, involving indeed all but impossibilities. Yet the way to attain to "the height of the great argument" would scarcely seem to be to christen as sacred characters the lawless Bedouin of the desert or the degenerate Jew of the city. Fra Angelico in his narrow cell was a Christian artist in a purer and nobler sense.

We will turn to the illustrations themselves in further elucidation of the artist's strength and shortcomings. Beginning with the

tion of the artist's strength and shortcomings. Beginning with the "Annunciation," the angel delivers the message to the girl-Madonna as in a confidential stage-whisper, and, were it not for the white lily and the wide-spreading wings, we should scarcely guess what it was all about. "The Salutation," which has been misnaumed "The Visitation," is in its free, easy, and thoroughly French way of approaching sacred themes a bold departure from the accustomed reading. The Virgin would seem to be hastening upstairs to render assistance to St. Elizabeth as midwife; St. Zacharias, a Rembrandt sort of personney, has rushed to the door in a programment and budging down on the court helps in a programment. Zacharias, a Rembrandt sort of personage, has rushed to the door in amazement, and, looking down on the court below, is exposurating with the donkey-driver, who would seem about to present to the irate old man a bundle of baby-linen. We have searched in vain among these "Evangelists," which give fourfold elucidation of the Life of Christ, for one single representation of the Ascension. This strange omission may receive fitting rebuke in the words of St. Paul, who writes that "if Christ be not risen then" is roun feith main". And or we would see the result of the strange the words of St. I'aul, who writes that "if Christ be not risen than is your faith vain." And so we would say to a painter who declines to represent the ascending Saviour, "Your art is also vain." The sacred narrative, if approached merely as an uninspired drama, needs the crowning climax; even from a literary and an artistic point of view, the Crucifixion demands the Ascension. The grandest drama in the world's history was not thus curtailed in its final act by the Christian painters of the olden times.

With more estigation we turn to such of these desires a line.

With more satisfaction we turn to such of these designs as reconcile originality with reverence, or redeem common nature by elevated thought. Fine is the conception of "The Three Kings" on horseback, the star lighting them on their way in the dark night across the hills of Bethlehem. "The Baptism" also deserves notice, as affording almost the only evidence that the artist has mastered the human form when undraped; the attendant figures, half revealing themselves through shadow, are among the many amplifications which come in compensation for the deficiencies inseparable from modern modes of treatment. If the old painters had separable from modern modes of treatment. If the old painters had more of simplicity and purity, our living artists gain in fulness and in accumulative appliance and resource. Thus "The Healing of the Blind" is atrong and impressive through close study of nature; the helpless groping in darkness when hodily sight is abut out gives opportunity for striking delineation of character; yet nothing in present days approaches Raffaelle's cartoon of Elymas the sorterer struck blind. Here we see the superiority of the Roman

Lee Saints Energiles. The Text by Bossnet. Illustrated with 126 large Plates by M. Bida etched by eminent living Artists. The Ornaments by 1.1. Ch. Rossigneux. 2 vols. Vischette et Cie.

school in the power of maturing single figures, a faculty now lost sven by the French. But among the compensations of which we have spoken we must not forget a dramatic sense of situation, a habit of walking, as it were, all round a subject and of talking in odd corners among the spectators concerning the main action and the chief characters. By-play, in fact, is now permitted as it never was before within the sacred precincts of religious art. As examples in the plates before us, we may quote "The Widow's Mite," "The Holy Women bearing Perfumes to the Sepulchre," "The Baptist in the Desert, exclaiming Behold the Lamb of God," "The Parable of the Sower," "Jesus and His Disciples on the way to Cæsarea." In the English school, Mr. Armitage, in freedom of thought, in picturesque situation, and in circumstantial accessories, most nearly approaches, as might be expected, this French latitudinarianism—we do not use the term in a bad sense—while, on the other hand, Mr. Herbert and the in a bad sense—while, on the other hand, Mr. Herbert and the late Mr. Dyce are, for better and for worse, in comparative bondage to authority. It is, however, the exceptional merit of M. Bida that he is so many-sided as to escape the penalties implied in a restricted classification. Here we encounter a scenic cavalcade of horsemen with banners passing at the time of the Crucifixion near to the soldiers casting lots—a composition which for freedom and fulness is worthy of Tintoret in his most exuberant moods. Then we come upon "Christ Walking on the Waters"; the figure of superhuman stature floats across the sunny sea as a spirit seen by its own effulgence; the tempest sky clears in the presence of Him who commands the storm. In early Christian art, in pre-Him who commands the storm. In early Christian art, in prenaturalistic and pre-scientific days, accessory landscape and the actual forms of nature were almost of necessity reduced to generaliactual forms of nature were almost of necessity reduced to general-ties or negations. Now all is changed; space, atmosphere, even conditions of weather, receive so much attention that the danger becomes imminent that the figure may be brought to a mere fraction of the whole, and that sacred art may be reduced to a department in genre-painting. Yet we willingly admit that those designs are the best of their kind, and in point of execution many of the plates rank among the most masterly examples of the French school of etching—a school which has often found appre-ciation in our pages. ciation in our pages.

AMERICAN LITERATURE.

MOST cultivated Americans can write, better or worse; and most Americans who can write decently seem to think it necessary to make a book out of any journey of sufficient length that they may take, however trite the subject, and however familiar the scenes which they have more or less hastily traversed. If the shelves of Transatlantic publishers have room for any other matter, it must be because so large a propor-tion of American tourists travel too fast to remember enough of what they have seen to furnish material for a book. Those who have had leisure to observe, no matter what, and have skill to describe what hundreds have described before them, seem skill to describe what hundreds have described before them, seem to consider the publication of their experiences as much a matter of course as the performance of the regular routine of sight-seeing. We are not speaking of those who have visited countries like China and Japan, which were but lately barred against all but the most adventurous travellers, and which, however fully and frequently the peculiarities appreciable by a mere visiter may have been told, still seem to the multitude like new ground; thou; heven in this case it is astonishing to find how little real knowledge, how brief and imperfect an experience, suffices to knowledge, how brief and imperfect an experience, suffices to knowledge, how brief and imperfect an experience, suffices to warrant the voyager in afflicting the world with a large volume, of which the greater part might have been written at home by any one who had access to a good library. Nor do we speak of India; for, however familiar we may be with that country through the writings of Englishmen who have spent their lives there, American visitors there are not frequent, and may be supposed to regard the subject from a different point of view. What surprises us is that, though thousands of their countrymen yearly make the tour of Europe, treading over and over again the same beaten track, from Liverpool through Great Britain, France, Germany, Switzerland, and Italy; and their countrymen yearly make the tour of Europe, treading over and over again the same beaten track, from Liverpool through Great Britain, France, Germany, Switzerland, and Italy; and though these countries must be almost as well known to stay-athome Americans—if there be such a class—as to untravelled Englishmen, every year produces a number of "Sketches," "Pictures," and "Tours" of Europe, until the authors are more at a loss for new titles than they seem to be for any other part of their work. This is the more remarkable because Americans comparatively seldom depart from the regular tourist route, and show far less originality of purpose or independence of taste than those who make excursion after excursion under the tutelage of Mr. Cook. We have before us an example of the regular American round in the Pen Pictures of Mrs. Peake. The author was indeed more fortunate or more sensible than the generality of her countrymen, in that she gave a year and a quarter, instead of three months, to the exploration of Western Europe; but she departed as little as any of them from the routine of the invariable journey. She saw the principal cities of France, Belgium, Germany, and Italy, made the tour of the Rhine, and paid a brief visit to Switzerland; she saw the sights of England and Scotland, and concluded with a rapid peep at Killarney and one of two mose of the most familiar

"points" of Ireland; and then her work was done, and she con-ceived herself fully entitled to write a big octavo volume on things and places every one of which has already been described a thousand times, and is yearly described in at least half-a-dozen rival claimants for the attention of the American public. dozen rival claimants for the attention of the American public. We must allow that Mrs. Peake is readable to those who have not read, or have had time to forget, the heat of her predecessors; and that there is something interesting in the perusal of American romarks upon the daily incidents of English life, and American impropsions of the most remarkable monuments of English history, if they find a reader who has not enjoyed the same opportunity some score of times already. In a word, the book would be worth reading if it contained anything that anybody had not read before. The illustrations are even less novel than the text. There is not one of them that is not to be found in a dozen or more of the commonest illustrated historics, congraphical text-books, or guide-books, nor do they rise in execugeographical text-books, or guide-books, nor do they rise in execu-

tion above the level of their kind.

Europe viewed through American Spectacles has the morit of novelty in form and manner, if not in substance. Its contents were originally published in American journals; and they are still broken up into the headed paragraphs, with sensational or attractive titles, into which American newspapers are wont to distribute all narratives, whether of murders and police scundals, of balls or of battles, of Wall Street panies or English Ministerial crises. The effect of this in a book is very curious, especially to English eyes; and in the present instance it has the advantage of enabling the reader to skip all the padding, descriptions converting of presental experiences and priestions. description, narrative of personal experiences and privations, complaints of European differences from American manners and morals, of hotel discomforts and Heidelberg duels—in fact, the rubbish or crambe, repetita which fills three-fourths of the book and to fix upon the passages which contain the pith of the writer's observations on English or Continental politics and institutions, as summed up for the benefit of his Transatlantic employers. There is not much in a Correspondent's letter that is worth preserving for after-study: but a few remarks on the social deposition of the social deposi after-study; but a few remarks on the social despotism of German Governments, the manner in which the requirements of military service and the State limitations on marriage affect the comfort and morality of the people, and the extent to which they operate in driving forth that large German emigration which is becoming so important a feature in the increase of the population of the Union, and seems likely to exercise so great an influence on the character and fortunes of the Western States, afford an example of the kind of matter which a judicious reader may pick out from the indigresta moles of a republished nowspaper correspondence, and which distinguishes the volume before us from the pure and unmixed inanities of the ordinary tourist. As to reading it through, the print and arrangement would suffice to scare away even a prisoner of the weather in a country inn if he had a County Gazetteer or a ocal Guide as an alternative.

Mrs. Grace Greenwood is even more daring than these European travel-tellers. Her "New Lands" † are only the interior territories of the Union and California; her descriptions of "New Life" hardly go beyond lively sketches of the external appearance of Colorado miners, Mormon elders, and Californian farmers. We have not found in her volume a single new fact or fruitful suggestion; but it is written with all the tact and skill of a practised gestion; but it is written with all the tact and shill of a practised hand, and may be recommended to those who are not stready surfeited with accounts of the Pacitic Railroad, Utah, Colorado and California, the Golden City and the Golden Gate, the Yosemite, and the sea-lions, as one of the least tedious of the manifold works which, since the opening of the Pacitic line, have professed to familiarize the older States with the appearance and character of their youngest sisters. We remember one or two very much better, and a score or so very decidedly worse, though none perhaps so wantonly offensive in the matter of forced jokes and frantically feeble witticisms. The author is a strong advocate of woman's rights, which she constantly obtrudes on the reader, à propos of anything or nothing; and it is at first sight rather curious to observe her decided tendency to admire and sympathize with the Mormon chiefs lately persecuted on account of polygamy. But we must remember that antagonism to the marriage laws of their country, and to all established customs affecting the relations of the sexes, is a characteristic of her sect; and that the Mormons, like their social antipodes, the advocates of female equality, are asserting their right to try a now social experiment without legal interference. The chapters on Utah bring out two points which have not received the notice they deserve. First, that the polygamists were prosecuted as adulterers under a territorial statute of their own making, which did not mean to treat polygamy as adultery, so that the law was clearly perverted to their injury. Next, that whatever Brigham Young's errors or crimes, his disciples have some reason for their attachment to one who has brought the majority of them from abject poverty at home to comfort and competence in the desert which his governing skill has converted into a garden. hand, and may be recommended to those who are not already surreason for their attachment to one who has brought the majority of them from abject poverty at home to comfort and competence in the desert which his governing skill has converted into a garden. This last point is not to be forgotten when it is proposed to extinguish the creed and punish the leaders of a hundred thousand resolute fanatics at the point of the bayonet.

The Ninth Annual Report of the Massachusetts Hoard of State

Pes Pictures of Europe. By Rlinabeth Peaks. With numerous spirations. Philadelphia: Lippincott & Co. London: Trübner & Co.

Europe viewed through American Spectacles. By Charles Carroll Fulton, Editor of the Baltimere American "C. C. F." Philadelphia : Lippincott & Co. 1874.

[†] New Life in New Lands: Notes of Turel. By Grace Greenwood.

Charities, like most similar documents, throws some incidental light on a point which we have more than once noticed in these columns—namely, the peculiar method by which Americans contrive to unite the advantages of private charity and public support, the zeal and kindliness of individual interest and control with the sufficiency of means and the effective supervision which only State action can ensure. The charitable institutions of Massachusetts are to a large extent founded by personal efforts, and enjoy the benefit of the personal attention and eager interest which the representatives of voluntary subscribers generally display. At the same time, the State does not hesitate to vote considerable sums to them, on condition sometimes that one or more trustees shall be nominated by the Governor, sometimes merely that they shall submit to official visitation. In other cases, the State itself provides the institution—as in the instance of orphans, deaf and dumb and blind children—but avails itself as far as possible of the assistance of individuals, by entrusting its profigies to the care of private families. The Reformatory system, under which juvenile criminals and vagrants are taken in charge and disciplined by the State, is pretty fully explained in this Report, and deserves the attention of those who are interested in the subject. Perhaps the most remarkable feature of this particular Report is the very earnest pleading of the Board in favour of the principle which, as applied in our Contagious Diseases Acts, has moved English Radicals to such extravagances of falsehood and of fury. The controllers of the Idiot and Lunatic Asylums of the State are compelled to know what are the chief causes of congenital imbedility and disease, and of hereditary tendencies of the worst kind breaking out generation after generation; and, as nearly always happens, in proportion to their knowledge of the subject is the strength of their conviction in favour of strong preventive measures of the only kind that can really be effec

History of Canada t, and it is somewhat meagre and incomplete. It seems, moreover, to take a hasty leap over the first half of the present century, so as to conclude with a hasty glance at the existing state of things. So far, however, as the history is really carried, it is brought down only to the close of the last century, and covers chiefly the constitutional story of the French colonists under the government of their conquerors, who left them in possession of their own laws—laws dating from long before the Revolution, and including all the abuses of the ancien régime—and therefore subject to the exactions and tyramy of their seigneurs. The influx of a very small number of English settlers, not with standing their angry hostility to a form of government so very different from that onjoyed by their fellow-countrymen in the original British provinces to the southward, did not induce the Home Administration to change its policy, or to treat Canada as an English colony; and when the American Revolution began, the only class of the Canadians whose loyalty could be relied upon were the French noblesse. But the invasion of the Americans was signally repulsed, and shortly afterwards the flight of all loyal subjects from the rebellious provinces, and their settlement in Canada, secured the authority of the Crown, and enabled the Government, when peace was made, to extend to Canada the ordinary liberties of English colonies. The subsequent history is, as we have said, just touched in outline; why this should be done in what is professedly but the first volume of a complete work it is not easy to see.

Mr. Hallock's Fishing Tourist t contains a lively account of the various "game fish" of American waters, chiefly the Salmonide, as well as a series of sketches of the different fishing-grounds of the North, enlivened by narratives of his own experiences and adventures therein. He also mentions briefly the organization of the Society of American sportsmen of which he is secretary; an Association comprising some hundred members, and possessing an extensive tract of land, with excellent salmon and trout streams, already not ill-provided with game, and on which it is the object of the Association to collect and accumulate every species of object of sport—feathered, furry, or finny—that can be conveniently kept there. When the plan is carried out, it will be possible for an American gentleman, at the cost of one or two hundred pounds entrance fee and a moderate yearly subscription, to enjoy, within easy reach of his home, such sport as is not to be had by Englishmen, either in Scotland or in Norway, for ten or twenty times the price. The idea of preserving a vast tract of wild land against the rapidly rising tide of

eivilization, so as to maintain a preserve of every sort of game and a region as solitary and as beautiful as ever, for the enjoyment of an aristocratic club, may not be a popular, but is certainly a spidted and sensible idea. And perhaps by the time that cultivation extends so far as completely to surround the Blooming Grove Park, popular opinion may recognize that sport—real sport—is among the healthiest and most legitimate of human pleasures; and farther, that those who, even for a selfish purpose, retain in the midst of a tamed and highly-farmed country a tract in all its native wildness and beauty, are doing, not an injury, but a service to a man which seems in more danger of suffering by too rapid expansion than by any lack of available room to expand.

The tenth volume of the Memoirs of the Historical Society.

The tenth volume of the Memoirs of the Historical Society of Pennsylvania contains the second portion of a most important correspondence, forming in truth a valuable part of the archives of the State—namely, the letters which in the earliest years of the existence of the province passed between Penn himself, its founder am proprietor, and John Logan, Secretary of the local Government in Philadelphia, who appears to have been specially charged with the care of Penn's proprietory and political rights and interests. The publication is the more useful that the correspondence does not, as it should, belong to the State, but to the Logan family; and, being in the possession of private persons, and not enrolled among the public records, the originals might easily, in the rapid exchange and dissipation of family properties which takes place in America, be dispersed or lost. To a reader who is not familiar in detail with the history of the settlement and the character and position of the persons mentioned, the letters do not convey any clear or connected idea of passing events, beyond the general impression that Penn was on bad terms with the settlers at large, and relicod and Logan as something between an agent and a spy to keep him informed of their proceedings, and on his influence with the Court at home to buille any schemes that threatened his authority or his interests. Much fuller notes would be required to render these long discussions of minute details of public and private business distinctly intelligible. The work, therefore, is not a readable one; it simply preserves and renders accessible the materials of history and the earliest documents of Pennsylvanian colonization for those who may hereafter have occasion for them; and a local Historical Society can hardly do better service than this.

We have before us another huge volume of the interminable series of the Geological Exploration.† It is the first part of a work on the Extinct Vertebrate Fauna of the Territories, extending already to some 350 quarto pages of text, with innumerable illustrations, and containing the most minute and careful descriptions and measurements of every bone, vertebra, jaw, and tooth discovered in the vast interior district known as the Territories—a region whose geology is as peculiar as its mineral wealth is enormous, and whose past history seems to have been as strange as much of its present appearance.

The memoir of Thoreau, the Poet Naturalist 1, by Mr. W. E. Channing, is so wanting in coherence and distinctness, so full of sentimental and descriptive passages and of fine writing, contains so many quotations from Thoreau's own writings intermixed with what appear to be citations from others, and is altogether so inconsecutive, that the reader has great difficulty in making out the figure of the man whom Mr. Channing professes to set before us. That he was a man of considerable eccentricity as well as of a certain originality, that he was rather a lover of nature than a profound scientific inquirer in natural history, that, like most exceptional people, he was rather shunned by the many and warmly admired by a few, is about all that remains impressed on the mind after a perusal of this volume; and the image might stand for that of a hundred other men as well as of Henry David Thoreau.

His Marriage Vow § is one of those literary offences which it is hard for a critic to forgive; a novel in form made the vehicle for a variety of theological and ethical speculations. Of verse we have three volumes; Ballads for Little Folk ||, which clever children of ten years old will understand, and think a little beneath them, while their younger playmates will be puzzled by the best and most elaborate pieces; The Troud Miss Macbride ¶, a clever but glaring imitation of Hood's "Miss Kilmansegg"; and The

ABRIDGED PROSPECTUS.

HOUSE and Shop Properties, when judiciously purchased in managed, are very remuncrative. They not only produce an immediate turn upon the capital invested, but they increase in value year by year; the presented depending on the nature of the properties and the locality in which they estuated.

amount depending on the nature of the properties and the locality in which they a stuated.

According to the lengthened experience (nearly twenty-three years) of a Directors of the Britzinek Building Sagiery (the largest in the United Kingdon numerous instances, doubled intential value within the last swonty, averages. It not rare, indeed, sto find that a house which would have been deemed highly refer twenty years ago at 240 ks, at the present day, oughfored chapty rested at 280 290. In many cases, rents have quadrupled in amount within the same period time, and there appears to be no limit to the increase within a radius of about it miles from the General Post Office. In soluted localities, where routs have fail it will be found that there are special causes to account for the depreciation.

Notwithstanding the state of the present account for the depreciation.

time, and there appears to be no limit to the increase within a radius of abous it miles from the General Post Office. In solated localities, where contended in the will be found that there are special causes to account for the dispression. Notwithstanding these facts, there are few associations having for their abject investment of money in the parchase of houses and shops, and those existing are a very limited scale. Building is cutters, which are popularly supposed to buy a sell houses, do at act in a corporate capacity; they restrict their operations to vancing money to their members for this purpose, and shops, and those existing are a very limited scale and their shorts for the purpose, and shops and parameter of all well-managed Build's states as sufficiently proves, for they exhibit numistakelie signs of pusagetty, their shorts been paid, and the state that shares been a high premium. As an instance, the last Annual Report (of Twenty-Second) of the Burkhata Building South 1863, and hich contitug fractions 143 have been paid, are now onth £ thouse smed in 1863, amount paid £44, are worth £51; while those issued in 1879, which £11 only have been paid, are worth £44 are worth £51; while those issued in 1879, which £11 only have been paid, are worth £44 and supported the present time.

Those facts furnish sufficient evidence that House and Shap Property, when de with on a large scale, affords a safe and lucrative lavestment, but there most favourable crims the transactions must be on a wide basic-claims whomes of all classes—as the means by which a fair profit can be scarsed. THE OPENING OF PARLIAMENT.

her how Parliament met on Thursday, and began iter sarrier by electing Mr. Brand as Speaker. A member the Conservative party proposed his nomination, a the Conservative party proposed his nomination, a similar of the Liberal party seconded it, and Mr. GLAD. One added the expression of his legitimate satisfaction that Speaker whose original selection, had been his work should have so conducted himself in the last Parliament that a new Parliament was unwilling to lose the great tenest of his services, although the power of deciding who shall be Speaker has now passed to Mr. Brand's political adversaries. In 1841 the same thing occurred, and then as now a Conservative majority adopted the choice previously made by their opponents. Mr. Brand without under the disadvantage of having to combat the language the disadvantage of having to combat the imbaed him with the spirit of a partisan. In the consect two years he not only dispelled that suspicion, but convinced every one that it was any Speaker that the feeting of the chair, and possessed in a remarkable degree the very exceptional qualifications ker whose original selection had been his work remarks blood gree the very exceptional qualifications has a really good Speaker must possess. When such a man, with ample experience and acquaintance with his duties, was known to exist, the Conservatives would have made a great intelliging they had used their majority to give his place to love one size; and as they had made up their minds to retein him, they very wisely, through Mr. Chaplin, did what they did in the bandsomest manner, and strengthened his hands by a hearty and unanimous adhesion. A good Speaker is at all times essential to the House of Commons, but there are special reasons why such a man is wanted now. The new Parliament is full of new members, and something the a third of the House finds itself at Westminster for the first time. These novices have to learn the forms of the House, and it is a great gain to them to know that they will be under a tracker who, by general consent, is allowed as master of his art. Some change of this sort necessahappens at every general election, and there will always be a large number of members who have to begin at the beginning of Parliamentary business. The new members are now more numerous than in the average of new Parliaments, but still the mere excess of new members does not make any great difference. The graver reasons that make the chairs of as good a Speaker as can be got peculiarly desirable now are to be sought in the composition of the Manas itself. In the first place, as Lord Geolus Cavendish pointed out, many of these who in preceding Earliamentary business have now disappeared. Mr. Bouverie, Single Cavendish have now disappeared. present to bring their patiently-acquired knowledge to bear in the conduct of affairs in the House of Commons; and HUR will therefore have to work with loss assistolditori In the noxt lone Balers, who are said isolated group,

efforts of the House to assert its dignity and supremacy will be much facilitated if the chair is occupied by a Speaker who possessus general confidence, and who can be relied on to be as firm, as courteous, and as important in dealing with House Ruley as in dialing with representation.

dealing with Home Rulers as in dealing with any one class.
Up to the time when the House of Commons met there was no cease in the flow of apeculation on the causes which have led to the strange result of a Inberel unjority of nearly seventy being turned into a Conservative majority of fifty. The blunders of the late Government, the rashof fifty. The blunders of the late Government, the rashness of Mr. Glabstone, the want of spirit in fereign policy, the alienation of powerful interests, the revolu-tionary programme of extreme Liberals, the meanness of an excessive economy, have all been amply commented on, and different critics have their own theories as to which of these causes of the defeat of the Liberal party have worked most powerfully. The inquiry seems new to have reached the limits to which it can be usefully carried, reached the limits to which it can be usefully carried, and it is beginning to be found that even when fresh speculators come into the field they have not much that is fresh in the way of speculation to offer. Now that the new Parliament has met, it is a second to inquire what it is likely to do rather than how it came into existence. Every guess as to the prevailing tone and character of a body which has yet to reveal its qualities must necessarily be merely a guess. but it is not verbane must necessarily be merely a guess; but it is not perhaps very hazardous to estimate that the prevailing tone and character of the new House will be that of a Palmerstonian Liberalism. Those who think it will be reactionary would do much to assist criticism if they would explain in what directions they think reaction possible. It is much more probable that the Conservatives will try to occupy new fields of legislation, and in administration to make practical simprovements, than to undo the work of their predecessors. For the task of making a new era in several departments of legislation the Conservatives have certainly a golden opportunity: To begin with, they can take their time. That they should do little or nothing this year is assumed as quite in keeping with their proper position. Mr. Disparti has set the example by making up with unusual slowness the long list of his minor appointments, and now that he has finished, it may be said to his credit that there is not a single appointment be has made to which exception can be taken. Law Reform, Sunitary Reform, and Local Taxation are subjects which must be dealt with very slowly and very carefully if they are to be dealt with at all, and, the more slowly they are dealt with the less will a Conservative Government be willing to abandon the reputation of having devised equitable and comprehensive measures for the passing triumph of favouring the pecu-liar interests of its supporters. To turn from a aphere of liar interests of its supportors. nar interests of its supportors. To turn from a sphere of activity to new fields where party spirit cought not to be allowed to dominate, and to show activity by doing one thing at once and doing it well, will be the best policy for the Conservatives and for the country that the Government can pursue. They wish to signalize themselves by a happy contrast with the Government they have defeated, and it is in this way that they will have the means of and it is in this way that they will have the means of making such a contrast most apparent.

There are times for all things; and now is the time for chreful work in matters of great practical importance, but not of any very stirring interest. This may be allowed without saying that this is the only mode in which the business of a nation in the business of a nation in the transacted. There is also a time when therefore, impetitions activity, enthusiasm, a staire of through masses of work although they may be got through imperfectly are needed and approved by a nation.

the differences of the work that has to be y in the same way there may be alternativing and spending Governments, to the gain and not to the loss of the nation. Economy may be pushed too far, and spending may be pushed too far, and we get right in the long run by having some Governments that look after every halfpenny and some Governments that give away sixpences like gentlemen. But in England no Government is or ought to be unchecked in the development of its own special tendencies. The Opposition ought to be always at hand to do its duty, and to limit whatever is extreme in the conduct of its adversaries. It had been rumoured that Mr. GLADSTONE, pained, as he might naturally he, by the strong rebuke the country has administered to him, and disgusted by the great change of position now forced on him, was about to shrink from the discharge of his duties as leader of the Opposition, and would appear only now and then as a messenger of warning or monace in the Parliamentary arena. When, therefore, it monace in the Parliamentary arona. When, therefore, it was seen that he was in his place on the first day of the gathering of the new House, and took his proper part in the ceremonics attending the election of the Speaker, his appearance was greeted with cheers that had a significance which must have been as intelligible to him as to every To perform the duties of a leader of Opposition with dignity, resolution, and calmness is not an easy task for any one, and it is a task which will probably be especially distasteful to Mr. Gladstone. But it is a task which he cannot abandon without shrinking from his duty to his country. Mr. DISBAELI was in many respects an admirable leader of Opposition; but it cannot be concealed that the Conservative party did not always do its duty when it was confronted by the late Liberal majority. The unfortunate appointment of Sir Stafford Norrhcote as one of the negotiators at Washington, as they were termed, or as one of the recipients of Ministerial telegrams, as they might have been styled more appropriately, was accepted by the Opposition as a reason why they should pass over the strange settlement of the Alabama question as beyond the pale of their criticism. Conservative candidates at the recent elections were eager to appeal to the wounded pride which they found the settlement had awakened in the nation; but the leaders of their party had done little or nothing to avert such mis-chief as this settlement involved, or to protest against it while there was still time for opposition to be effectual. Subsequently, the value of an intelligent Opposition was strikingly shown by the success with which Mr. HARDY forced on the Government the conviction that, in undertaking to obtain the consent of other nations to the new rules of international law, they had undertaken something which they had much botter quietly abandon. The Liberal party has now no programme; nothing to fight for, nothing There is all the more reason that it should set to propose. itself to perform satisfactorily the functions of an Opposition, and should, without captious interference, keep that watch over the Ministry which is so salutary both, to the nation and to the Ministry itself.

THE ASHANTEE WAR.

A MONG the many little wars which from time to time . occur on the outskirts of a widely extended Empire, the contest with the Ashantees will not have been the least instructive. The Caffres of Southern Africa, the Maoris of New Zealand, and several of the hill tribes of India have proved that uncivilized enemies are not to be despised, and also that, when adequate use is made of superior weapons and discipline, they are not to be feared. Although English troops have almost uniformly succeeded in encounters with barbarous tribes, the relative superiority of Europeaus to coloured races has in the course of three or four centuries rather declined than advanced. The exploits of the Spanish conquerors of America have not been approached by modern imitators. With a few hundred men, aided indeed by native auxiliuries, Corres and Pizarro not only defeated, but permanently subdued, great and populous States which were wealthier, and in some respects more polished, than their own native country. The English soldier of the nineteenth century is probably as brave as the Spaniard of the sixteenth, and he is incomparably better armed. In the present campaign the General in command is not known to have made a mistake; and if he has been compelled to prepare for the evacuation of the enemy's capital a

day or two after he has forced his way into it, the danger which he apprehended is that of climate and not of armed resistance; but even in the temperate region of New Zealand, uncivilized warriors met English troops with no extraordinary superiority of numbers. It is supposed that at Amoaful and in the subsequent skirmishes the delanates were numerous, though it was impossible to calculate their strength. It is remarkable that they appear to have seen exempt from panic. The Mexicans and the Peruvis erreterrited by the rude firearms of the Spanish invalue, but now one of the blessings of commercial intercourse consists in the universal diffusion of muskets and gunpowder. Savages are still fortunately unable to buy cannon or to make rockets; but they have finally discarded hows and arrows, which would not be formidable weapons in an African jungle. Competent critics admit that the tactics of the Ashantees are well adapted to the nature of the country which they defend; and on the whole, notwithstanding some questionable tendencies, they seem to possess qualities which have not been usually attributed to the negro race.

Mr. Goldsworthy's telegraphic message from Cape Coast Castle, dated on the 8th February, affords some ground for hoping that the war had ended with the capture of the Ashantee Kine. Unluckily, the want of forethought, or of practical imagination, which has prevailed on the Gold Coast since the beginning of the campaign greatly impairs the value of Mr. Goldsworthy's private letter. date attached to the event which he undertakes to record would have been far more instructive than a statement of the time at which he forwarded his message. It is also puzzling to be informed that a special steamer was getting up steam to carry to Madeira news of the highest importance which has nevertheless not been received by the Government. Mr. Goldsworthy himself was last heard of as commanding the reserve levies on the left bank of the Volta, while Captain GLOVER advanced to the sid of the Commander-in-Chief with that part of the force which could be induced to cross the river. It must be assumed that Mr. Goldsworthy has since been compelled by illness to retire to Cape Coast Castle; and it may be hoped that some English officer was ready to occupy his post on the Volta. At present no reliance can be placed on any information beyond the two meagre despatches which received in inverted order, and some confusion of statement, from Sir Garner Wolse-Coomassic on the 5th of February, having entered the town apparently on the 4th, after four days of hard fighting, which began on the 31st of January with the serious battle of Amosful. On the 2nd Sir Garner WOLSBLEY reports that he has since the battle met with but insignificant resistance. It would therefore appear that after the date of the despatch which arrived on Thursday last he must again have had to fight his way through a hostile force. If the intelligence communicated to his friends by Mr. Goldsworth proves to be correct, the King, who was out of reach of the English troops after their control of the English troops after their arrival at Coomassie, must have voluntarily surrendered himself a prisoner. So great an advantage can only have been obtained by a threat of destroying the town unless ample recurity were provided for the un-molested retreat of the invading force. It may be conjectured that, if the King is really a prisoner, he will be compelled to accompany the English general to the coast, with an understanding that he shall be escorted back to his own country by a force sufficient trensure his personal safety.

It is difficult, at a distance from the seat of war, to share Sir Garnet Wolseley's natural indignation at the treachery imputed to the Ashantee King. His undertaking, conveyed through the released missionaries, that he would not resist the English troops even if they were in the market-place of Coomassie, was at the best a nudem pactum, or bargain without valuable consideration. A promise given by a person who cannot reasonably be expected to keep it constitutes, even under the strictest moral code, but an imperfect obligation. When it is affered by an energy in the midst of war, a profession of peaceable intentions is convely more than an allowable military stratagem. The king had, according to the despatches, succeeded in impressing on his white prisoners his "entire inability to fight again, and his "determination not to do so." One of their sampler, Mr. Bawson, who was not liberated with the Garnet missionaries, appears not to have pattaken of their scalably.

Information obtained from Mr. Dawson's boy, sent down with the envoys, and the significant hint furnished by Mr. Hawson himself," prepased Sir Garser Wolseley for a possible violation of the promises which the King the supposed to have made. It appears from another account that Mr. Dawson concluded a short note relating to the matters with a pious reference to a text in the Epistle to the Cerinthians, which contains a segment the wiles of Saran. The Commander-in-Chin or his Staff fortunately understood, on referring to the passage, that the enemy of mankind was a type or symbol of the enemy in front. Even without reference to Mr. Dawson's ingenious hint, the General had wisely resolved to relax none of his preparations. His line of communication was carefully protected; and as soon as it was known that a hostile force was threatening his front and flanks, all his dispositions had already been made for an advance in force. It would indeed have been inexcusable to omit any precaution in reliance on the promises of the enemy; but it may perhaps have been judicious to delay the march on Coomassie as long as there was a reasonable chance of avoiding a collision. The halt which was made before the battle of Amoaful was not altogether a waste of time, as it happoned that some days were required for the accumulation of stores. Sir Garner Wolseley refers without anxiety to the attacks made by the enemy on his communications; and on his return to the coast the difficulty of defending the line will have been greatly diminished.

Little has been heard lately of the great moral reforms which were to be effected by an English victory. In the course of two days' stay at Coomassie Sir Garrer Wolsberr will have had no opportunity of touching the King the value of the lives of his subjects and his captives. If it were possible to restrain the cruelty of the Ashantees, it would be wrong to cultivate any superstitious dread of interference; but the English nation is free from all responsibility for criminal practices which it has no means of preventing. An indirect moral lesson may possibly be conveyed in the practical demonstration that troops which are neither the instruments nor the victims of wholesale murder are more than a match for Ashantee warriors. If no inference in favour of milder customs is drawn from the success of the expedition, the native intellect must be left to its own conclusions. The possession of courage and military aptitude implies for the most part a capacity for general improvement. The Fantees, although some of them have assumed a varnish of external civilization, are probably in a more hopeless condition than their vigorous enemies. The fuller reports of the campaign will explain how far the Ashantees have made progress in the arts of peace. The architecture of Coomassie is probably not ambitious nor complicated; but it may perhaps be adapted to the simple wants of the inhabitants. The apparent inconsistency between a desire for commercial access to the coast and a studious abstinence from the construction of roads is easily to be explained. As the English troops have practically found, a jungle or forest only traversed by narrow footpaths is one of the most effective kinds of fortification. It would have been impossible for a native enemy to overcome the resistance which cost Sir Garner Wolseley so dear. The climate offers a sufficient protection against a European invader during the greater part of the year; and the difficulty of communication all but completes the absolute security of the capital. The extreme unwillingness of the neighbouring tribes to join the expedition is no longer surprising.

THE GOVERNMENT AND THE INCOME-TAX.

of business till the 17th or 18th of March, and the Income-tax will expire on the 31st; formal votes must be taken in the interval, and at least one Bill must be carried through both Houses. The Chancellou of the Exchaquer will consequently be obliged with the smallest possible delay to make up his mind as to the renewal or abandonment of the Income-tax, and to obtain the assent of the House of Commons to his proposals. The remainder of the Budget may be conveniently deforred beyond the short Easter recess; but evidently the financial policy of the year will depend on the resolutions which may be adopted with to the Income-tax. If Sir Stafford Nurrel in emulation of Mr. Gradstore, heatily throw have five or aix millions of revenue, he will probably not

also create a deficit by the repeal of other takes, to purpose of afterwards filling up the void by adjustments. The non-renewal of the Income takes be therefore virtually a Budget in itself, involving the advantage of a necessary postponement of the ill-advised project of relieving the rates at the expense of the national revenue. Unfortunately, the Conservative party, though in other respects it is unincombered by pledges, has for purposes of its own attached an artificial importance to the supposed grievance of excessive charges on rateable property; and it is nearly cortain that the new Government will propose some public contribution in aid of local taxation. Insuperable difficulties would defeat any attempt to rate personal property; and the burden, if it is necessary to shift it from land and houses, would most conveniently be placed upon income. It would be impossible to increase taxes on consumption for the purpose of diminishing charges on occupiers or owners. On the whole, it may be concluded that the Income-tax will be renewed, either at the present rate or at a reduced percentage; and perhaps the Chancellor of the Exchequer may not greatly regret that circumstances compel him to arrive in a hurry at the decision to which he would probably incline on mature re-There was much force in Mr. Gladstonn's remark that it was scarcely worth while to impose on the taxpayers the necessary inconvenience of inquiries into their income, except for the purpose of ob-taining a large amount of rovenue. A demand of threepence in the pound is not excessively burdensome; but even twopence in the pound would produce three millions a year, which is an amount not to be despised by a Finance Minister. Notwithstanding frequent complaints of the violation of secrecy, and other collateral evils arising from the tax, human nature really revolts against the payment of money more readily than against any other form of vexation. If the machinery of the tax is inquisitorial, it still makes a great difference whether an inquisitor extorts twopence or a shilling. Even the sluggish honesty of traders under Schedule D is foreibly stimulated by every successive reduction in the rate of taxation.

The PRIME MINISTER, although he has undertaken to receive a deputation on the Income-tax, will probably show his good sense by leaving the financial arrangements to the uncontrolled discretion of the Chancellor of the Exemption. It would be highly undesirable that Mr. Distant's hasty declaration in the course of the late election should be allowed to influence the policy of his Government. Mr. GLADSTONL'S suddon offer of a gigantic bribo to the constituencies tempted his rival to bid against him in the assertion that any Ministry would, if possible, abolish the Income-tax. When a few days had been allowed for reflection, Mr. DISEARLE partially corrected his original mistake by proposing to reduce the Incometax, rather than to abolish it. A statesman who was, like Sir Robert Pent and Mr. Glabstone, specially acquainted with the principles of finance, would have abstained from professions of opinion which were certainly not the result of careful deliberation. If the Government is in any way bound by speeches at Aylesbury or Buckingham, the tax may perhaps be reduced to twopence in the pound, though it would be much better to maintain the present rate. The sacrifice of a penny in the pound would for the current year fall short of a million, so that the Chancellon of the Ex-CHEQUEE would still dispose of a considerable surplus. would be far more judicious to raise to a higher level the limits both of total and partial exemption. Taxpayers who have less than 300l. a year spend a large proportion of their incomes on taxable commodities; and consequently they have a claim to relief from direct taxation. Many incomes between 100l. and 200l. a year are now practically exempt, because they cannot be reached; and it would be in the highest degree equitable to place clerks, petty tradesmen, and small annuitants in the same position which is already occupied by artisans receiving high wages. It would be a still better plan to allow an equal deduction from all incomes, large or small, before the residue was subjected to taxation. The comparatively wealthy classes may, apart from considerations of public expediency and justice, be well secured that it is not for their interest to tamper with a moderate burden of direct taxation. Mr. GLADSTONE'S threat of adjustments offers a wholesome warning to the owners of property; and it is absurd to suppose that if exemption. In the speech with which he introduced his

great Budget of 1853, Mr. GLADSTONE declared that the alternative of an Income-tax of sevenpence in the pound would be a tax on land, houses, and visible property, of sixpence in the pound, a system of 7l. licences on trade, and an undefined change in the legacy duties. It is true that at the present moment the Income-tax might be removed at the expense of the estimated surplus; but the appropriation of the whole amount to the relief of the upper and middle classes would be in the highest degree invidious and impolitic. The payers of Income-tax ought not to forget that Mr. GLADSTONE proposed to charge them exclusively with the cost of all future wars, and, by analogy, with the duty of covering delicits which might occur in time of peace.

In the year 1862 Sir Stafford Northcote published a useful and singularly dispassionate History of Twenty Years of Financial Policy, beginning with Sir ROBERT PEEL'S Budget of 1842. In the course of his narrative he necessarily recorded the substance of the successive debates on the Income-tax in 1842, in 1845, in 1848, in 1851, 1853, and in the years which followed the Crimean War. After twelve years of additional experience since the publication of his work, Sir S. NORTHCOTE is not likely to repeat the popular cant that a tax which has lasted during two-and-thirty years of almost unbroken peace is essentially a war tax because the first Income-tax was imposed by Pitt in 1798. Sir Robert Perl intended that the tax should be temporary when he imposed it in 1842 with the main object of restoring the financial equilibrium. Having attained his original object, when he renewed the tax in 1845 he had already so far modified his policy that he used the tax for the purpose of reforming the tariff, a task which might probably require several years for its completion. In 1848 the Government of Lord John Russell, who had offered the strongest resistance to the tax in the time of Sir Robert Peel, was defeated in an attempt to raise the rate from sevenpence to a shilling. Lord DERBY and Mr. DISRALLI in 1852 displayed similar disregard for the protests which they had made in Opposition, although the Chancellor of the Exchequer included in his Budget a mischievous scheme of unequal assessment as between trade profits and fixed incomes.

Mr. Gladstone made, for the first time in 1853, a serious attempt to provide for the extinction of the tax in a period of seven years; but, finding himself once more in office in 1860, he renewed, and even proposed to increase, the tax for purposes analogous to those of Sir Robert Perl. It must be admitted that his late proposal, although it was improperly addressed to the nation and not to the House of Commons, was consistent with the opinions which he expressed one-and-twenty years ago. That the tax has during the whole of the interval been deemed indispensable is a strong argument in favour of its utility and justice. Shiftings of taxation, though they are sometimes on the whole desirable, always involve inequality and hardship. If the tax were now to be abolished, and, in consequence of any foreign complication, to be reimposed in the course of a few years, the aunoyance which would be inflicted would greatly outweigh the immediate relief. In choosing between direct and indirect taxation, financiers are well aware that duties on consumption have a tendency to derange trade and therefore to diminish wealth, while the pressure of the Income-tax corresponds accurately with the proceeds. All theory is in favour of direct taxation; and it is not prudent unnecessarily to challenge objections which may be difficult to answer. On every ground it would be a rash experiment to prepare for the Budget by annihilating the surplus, or by reducing it to an insignificant amount. The late Ministers deluded themselves into the belief that they had created a surplus which was due to the unexampled presperity of trade. Their successors, who will not be able to indulge in a similar hallucination, have still less temptation to use their fiscal good luck for the purpose of obtaining a hollow popularity.

PRINCE BISMARCK ON ALSACE AND LORRAINE.

THERE is always one merit in Prince BISMARCK'S speeches; it is impossible to mistake what he means. Whon he has to say a thing, he says it, and lets all the world into his secrets. So much is this the case that it has

style in the treatment of political and diplomatic busin differs from that of the late Emperor NAPOLEON. cumstances of the two men are very different. The EMPREOR was always trying hazardous strokes, feeling his way, watching how far it would be safe to go. He had to accustom his subjects to new ideas and combinations as to the tom his subjects to new ideas and combinations as to the value of which he was never perfectly sure. Prince BISMARCK has an incontestable position, puts boldly what he knows to be the opinions and wishes of majority of his countrymen, and seeks to lead them by pointing out the precise direction in which he wishes them to go. But it is scarcely possible that he should not be strengthened in following the natural bent of his mind by his experience of the mischief which ultimately arose from the policy of France being made for so many years an affair of dark schemes, obscure words, and grandiloquent sentiments. A motion was made a few days ago in the German Parliament the object of which days ago in the German Parliament the object of which was to terminate the present system of government in the annexed provinces. They are under a state of siege, and are administered by a virtually despotic authority. Prince BISMARCK resolutely opposed this motion. Alsace and Lorraine were in a state of siege, and nothing else would do. They had been forced to belong to Germany, and nothing but force could keep them in subjection to the German Empire. He did not for a moment pretend that the inhabitants of these provinces wished to be counted as Germans, and to have the Fatherland as their home. The recent experience he has gained as to their real wishes from the behaviour of the deputies they have selected to represent them in the German Parliament was such as to leave no doubt on his mind that they look on themselves as conquered aliens. But he thought it a very good thing for them that the question of the treatment they are to receive had been raised in the national Parliament. He even asked them to observe how much better they were treated than conquered Germans would have been if they had been annexed to France. At Versailles, he took upon himself to say, there would have been no liberty of speech under such circumstances. The victims of war would have been made to hold their tongues. Probably the deputies of the annexed provinces did not think that the liberty of speech did them much good, as all it came to was that it gave Prince BISMARCK an opportunity of saying that Germany did not affect to regard their opinions or wishes. The liberty of speech was principally on Prince BISMARCK'S side, and it was a liberty that degenerated into something like license when he diverged into a passing remark that the Alsatians and Lorrainers deserved to suffer for the war of 1870 because they had not protested against it. They were Frenchmen, and like other Frenchmen considered the question from a purely French point of view, and had no more power or disposition to protest than the people of Bordeaux or Brittany. As they have been conquered and are treated as conquered people, they can scarcely be asked to accept it as a matter of reproved to them that before they were conquered they hoped victory might befriend their side. To be quite explicit as to the intentions of the German Government in the administration of the annexed provinces was right, but Prince BISMARCK in his wish to be explicit need not have gone so far as to blame those over whom he had triumphed for their misfortunes.

We took Alsace and Lorraine, Prince BISMARCK observed, because we wanted a bulwark to defend our rights. is the beginning and the end of his justification. Rhine was not a bulwark, but, with Strasburg and Metz and the line of the Vosges, Germany has a very great security against invasion. It must be remembered that the whole plan of the campaign on the part of the French was to invade Germany. The advantage which the Emperor NAPOLEON thought that he had secured was that he could pour his troops into South Germany before the German army could be got ready. His scheme failed only because the mismanagement of military matters in France had reached such a pitch that he could not get his troops together in time. But what encouraged the French to go to war more than anything else was the general belief that the war would be fought on German ground, that it would be German villages that would be burnt, and German crops that would be trodden down. All the old wars between France and Germany showed that, if the French could but When he has to say a thing, he says it, and lets all the world into his secrets. So much is this the case that it has been supposed that his extreme terseness and frankness of Germans to enter France and very difficult for the speech are partly due to his wish to show how greatly his

sought to obtain by its enormous and exhausting efforts, and succeeded in obtaining. The necessary cost at which this success was won was that a couple of millions of people were made Germans against their will, which was bad for them, and also very bad for Germany; but as Germany could not get what it wanted otherwise, it determined to scald not get what it wanted otherwise, it determined to pay the price rather than fail in its object. It certainly does not lie in the mouths of Englishmen to protest on philanthesis grounds against such a proceeding. We took Malta it gave us the command of the Mediterranean, and the California it secured our communications with India, and we never troubled ourselves about the wishes of the Maltese or the Dutch boors. But at the outset the Germans hand that they had a pleasanter title to the annexed prohoped that they had a pleasanter title to the annexed provinces than the rude right of conquest. They delighted in imagining that they would be regarded as liberators freeing oppressed Germans from the chains of the foreigner. would have been so pleasant if the Alsatians had but understood othnology and the obscurer parts of modern history, and rushed into the arms of their loving Ger-man friends and relatives. These bright hopes are now at an end. Prince BISMARCK says that it was idle to suppose that the inhabitants of the annexed provinces would get to like German institutions in a single generation. In a couple of centuries he thinks new habits may be formed, and Alsatians be as good Germans as could be wished. This is a sad come-down from the ardent aspirations of three years ago. But Princo BISMARCK does not in the least mind stating what every one knows to be a fact. Whether Alsatians are pleased or not pleased, Germany has got her bulwark.

It is often taken for granted that the world has got beyond these barsh rights of conquest, and it is said that France more especially had at least the good taste to go through the form of a plébiscite when Savoy and Nice were annexed under the Second Empire. But Savoy and Nice were not annexed by virtue of conquest. They were but outlying parts of a kingdom the mass of which was in Italy. Their trade, their language, and many of their traditions bound them to France. When NAPOLEON entered on his first Italian campaign, the King of SARDINIA handed over Nice and Savoy to France without making any difficulty about it, and as the most natural thing in the world. The plebiscite was managed no doubt when Savoy and Nice were annexed, as plébiscites were ordinarily managed under the Empire. Lavish promises were made, elever people got voters to the poll, opposition was discountenanced and quietly stifled. But there was nothing like the feeling to be surmounted which existed in Alsace and Lorraine against annexation to Germany. Plébiseites, when such a feeling exists, are impossible unless they are so contrived as to be a mere hypocrisy and mockery. The late Emperor Napoleon did want to annex districts that would have hated to be annexed to France. He wished to get, if not the whole of the left bank of the Rhine, yet as much of it as was possible, and it was because England would not agree to his projects of conquest that the scheme of an alliance to protect Denmark fell through. He was beaten, first in diplomacy, and then in war, by Prince BISMARCK; but if he had succeeded he meant to do to the Germans exactly what Germany has now done to France. He would have annexed, if he could, a purely German population that would have hated to become French. In that case a plébiscite would have been either a miscrable failure or a scandalous imposture. To cover violence under some form of liberality and generosity is, however, dear to the minds of many in these days of kindly sentiment; and when the vote was taken on the motion against which Prince BISMARCK spoke, it appeared that the Fortschritt, or advanced Liberal, party had ranged itself on the side of his opponents. section of the supporters of the motion had not the slightest notion of doing what the inhabitants of the annexed districts really wished, or of abandoning an inch of the bulwark of Germany; but they would have liked to persuade themselves that this bulwark might be retained, and yet something pleasant be done for the poor Alsatians whose treatment seemed scarcely in harmony with Liberal principles. On the other hand, the Ultramontanes did not principles. On the other hand, the Ultramontanes did not put out their strength against Prince Bismarck. Perhaps their leaders were too wise to placard an unpatriotic wish to spoil Germany of its bulwark, and thought that a new excuse for the ecclesiastical laws might be drawn from the readiness of the friends of the priests to sacrifice German to French interests. Perhaps, too, some of them the bishop of Strassure, and hold that the

Treaty of Frankfort, however lamentable may be its comequences, must be upheld because it is a treaty, and therefore binding on the consciences of all subject to the signatures. Anyhow the majority which Prince Bindark commanded—nearly sixty in a House little over three hundred—was decisive enough to settle the question for the present; and the inhabitants of the annexed provinces must be convinced that nothing but main force will induce Germany to give up the bulwark it has got, and that if they cannot reconcile themselves to their hard and undeserved fate, and learn to live peaceably, if not contentedly, under their conquerors, they will be ruled with a discipline as stern as the German Government, which has large notions on the value and efficacy of stern discipline, may think desirable.

SPAIN.

THE last Spanish Revolution has not yet produced the L expected result of accelerating the close of the Carlist civil war. Marshal SERRANO, now Chief of the Executive Government, seemed to have many advantages over his predecessor, both as a military loader and because he was not encumbered with a factious Assembly. During nearly the whole of his term of office Castriar was compelled to devote his chief attention to the Separatist revolt of Carthagena, which was encouraged by a considerable section of the Cortes. The Republican Minister had also to counteract the immediate consequences of the demoralization and partial dissolution of the army through the agitation formerly promoted by himself and his political allies. While the attention of the Government was distracted by two mutually hostile insurrections, it was more surprising that the Carlists were confined to their own provinces than that the pacification of the North was found to be impossible. With a patriotic energy which will perhaps efface the memory of the mischief produced by his irresponsible eloquence, Castelar when in office devoted all his efforts to the reorganization of the army; and there was reason to hope that his successors would reap the fruit of his exertions. From the time when General Pavia, amidst universal approval, turned the Cortes out of doors, the whole of Spain outside the districts occupied by the Carlists has acquiesced in a Government which has the paramount merit of not having proceeded from universal suffrage. It may be assumed that Marshal Serrano and his colleagues have done their utmost to succour the army of the North; but nevertheless the Carlists have obtained several advantages, and finally they have defeated General MORIONES with heavy loss in the only engagement since the beginning of the war which approaches to the rank of a pitched battle. For some time past the Carlist leaders have surrounded and threatened the important town of Bilbno, situated on the river of the same name, and said to be in amount of trade the second port of Spain. The production of iron and steel, which made Bilbao famous in the middle ages, has now attained larger dimensions in the neighbourhood, and it was of great importance to the Carlists to obtain possession of the most considerable place which they have hitherto attempted to occupy. General MORIONES, having abundant means of transport by sea, more than once transferred his forces to different points on the coast to the cast and west of Bilbao. Finally he attacked, with an army of which the numbers are variously estimated at twenty or thirty thousand men, the Carlist line from the landward side, while the estuary of the Bilbao river was guarded by the Spanish squadron. After an action in which he is reported to have lost six thousand men, Mortones retreated to his former position, and applied to the Government of Madrid both to send him reinforcements and to provide him with a successor in the command of the Northern army. In answer to his appeal Marshal Serrano himself, accompanied by Admiral Torere, has arrived at Santander, for the purpose of directing the military opera-tions. The Chief of the Government is attended by an escort said to amount to two thousand men; but it is not yet known whether he has been able to provide sufficient reinforcements.

Seerano is far advanced in years, and his laurels have, like those of other Spanish generals, been acquired only in civil war; but he is supposed to possess some military skill; and he has every motive for doing his utmost to terminate the resistance of the Carlists. Having become by a battle won over the troops of Queen ISABELLA the hero of Alcolca,

Marshal SERRANO would gladly be also the hero of Bilbac or Tolosa if he could obtain a victory over the Queen's cousin and competitor. It would seem that in General Elio, and perhaps in other Carlist chiefs, Struano is likely to find capable opponents. The scattered bands which more than a year ago began the insurrection appear to have gradually consolidated themselves into a regular army; and while they have repeatedly baffled the Republican troops, the Carlist troops have during the campaign in-curred no serious disaster. No reliance can be placed on vague statements of the comparative numbers of the contending parties. In artillery, and probably in cavalry, the army of the Madrid Covernment possesses a great superiority; and some at least of the few guns which are now at the disposal of the Carlists have been taken from the onemy. It is another serious disadvantage that the command of the sea rests, as in the American Civil War, with the contral Government. It may be inferred from a late proclamation of blockade of some of the Northern ports that the Carlists receive supplies from the sea; but they have no vessel of war in their possession; nor have they any means of organizing a navy. The obstinate resistance of the Carthagona insurgents was rendered possible by their early seizure of the squadron which they found in the port. If the Southern Home Rulers had been able, like the Carlists, to levy recruits from a sympathetic population, or if the Carlists had possessed three or four iron-chid vessels, either revolt would probably have been successful. The progress of the Carlists has a grantly available available in that it of the Carlists has so greatly exceeded expectation that it might be almost supposed that victory was in their reach; but even when anarchy prevailed throughout Spain and in the ranks of the Republican army, the Carlists were never able to leave their own districts and to march on Madrid. The army which has now defeated Montones is perhaps better qualified for an offensive campaign; but it is at present impossible to judge of its strength or of its resources. An intelligible explanation has been given of the mode in which Don Carlos provides for the expenses of the campaign. Bilbao will, if it is taken, probably be compelled to furnish a liberal contribution; but the little towns and rural districts of the Northern provinces would long since have been alienated from the cause of royalty if they had been compelled to pay the cost of the war. It is not absolutely impossible that the result of the war may be the permanent or temporary separation of a part of the country north of the Ebro from the Spanish monarchy or The Royalists might console themselves for republic. imperfect success by comparing themselves to Pelayo and his Gothic companions who prepared in the Northern mountains for the ultimate reconquest in a distant age of the entire Peninsula from the Moors. On the other hand, the sympathies of Federal Republicans ought not to be excessively shocked by the development of provincial autonomy into absolute independence. Prophecies of the future of Spain would be idle, except as far as they foreshadow strange possibilities.

In the midst of war, political controversy, as well as law, is silent; and it might be plausibly alleged that Don Carlos and Serrano are equally contending for personal supremacy and absolute rule. Representative government, after its utter collapse, will not soon be even nominally re-established in Spain; nor is the experiment, if it is hereafter tried, likely to be successful. Marshal Serbano has, almost without attracting attention, recently converted himself from a Minister into a President; and the duration of his power, in the absence of some fresh revolution, depends wholly on his own discretion. Marshal MacManon, and M. Turers himself, perhaps borrowed from the former Regency of SERRANO the notion of a provisional kind of Monarchy which might be either indefinitely continued or changed for a more regular form of government; but in France there has always been a sovereign Assembly, while the Chief of the Spanish Executive is responsible to no superior. A Septemente or Quinquennate without a Parliament is scarcely distinguishable from a dictatorship, which again approximates to the type of absolute monarchy. Don Carlos would perhaps not object to the convocation of some kind of Cortes, on the understanding that the Assembly should not control the prerogative of the King. Marshal Serrano will never summon a Cortes unless he is well assured that the majority will do his bidding. Nevertheless the political similarity of the contending parties is rather formal and superficial than real. Parties are guided more by circumstance and tradition than by professions of doctrino; and Sereano and Topere belong to the present gene-

ration, while Don Carlos meditates an anachronistic newful of the past. In the worst days of Queen Isabella's reign intellingent Spaniards consoled themselves for the scandals of the Court and the shuses of the Government by the thought that despotism and bigotry were excrescences on the existing system, while they would form the essence of a Carlist monorchy. Seerano may probably protect the Church, but he will never acknowledge its supremacy. Though he may be regarded as owing his present position to the support of the army, he will probably wish to justificate possession of power by using it in accordance with a return community. It is a great security against despotism that Seerano cannot, like Don Carlos, practise it by right divine. He has the good fortune of having on his return to supreme power succeeded to the least popular Government which has ever ruled in Spain. A Federal Republic against which all Federal Republicans protested has left behind it neither regret nor possibility of revival. On the whole, notwithstanding the admiration which the Carlist chiefs and troops have deserved by their heroic efforts, it is for the interest of Spain that the Central Government should succeed in suppressing the insurrection. A year and a half ago Seerano granted liberal terms to the defeated Carlists in the name of King Amadeo. If he should again be victorious, there is no reason to suppose that he will offer unduly harsh conditions of peace

THE TICHBORNE TRIAL.

BISHOP BUTLER is reported to have once turned upon his secretary with the alarming inquiry, "Why " might not large bodies of men and whole communities be " seized with fits of insanity as well as individuals?" The startled secretary could only suggest reliance upon Providence to avert such a calamity. It would certainly appear, however, that there are epidemics, if not of insanity, at least of infectious folly and nureasonableness, which come to pretty much the same thing. It is scarcely possible to account in any other way for such a deplorable exhibition of human silliness as has been afforded in connexion with the Tichberne case. The really amazing thing about this imposture, as we look back on it, is that it should ever have imposed on anybody. The originator of it himself was hardly serious about it until he found that other people took it seriously, and probably no one was more surprised than he was at the extraordinary success which awaited him. He found, like St. DENIS, that in a matter of this sort the first step is the great thing. The conjurors understand the same principle, and, when once they have forced a card, they can carry on their tricks to any extent. In the course of time the imposture grew into a formidable plot and organized conspiracy. Ouron was surrounded by a host of people, attorneys, money-lenders, speculators, and hangers-on of all kinds, some of whom were probably conscious confederates, while others were only dupes; and by their help the ball of falsehood was gradually rolled into something like shape and consistency. All this, however, could not get rid of the fact that for some twelve months after the Claimant gave himself out as ROGER TICHBORNE he was hopolessly and ludicrously in the dark as to everything connected with Rogen and his family, beyond a few stray facts which he had picked out of the newspapers. Even at the end of five years' coaching he was still ignorant of the greater part of ROGER'S history. The strongest evidence of other persons in favour of the Claimant could not possibly make head against the Claimant's own evidence against himself; but the manuer in which his witnesses were got together only required to be exposed in order to show the worthlessness of their testimony. Those who believed that the Claimant was genuine had to accept a whole string of improbabilities, and even impossibilities; as, for example, that only one of the survivors of the Bella should ever have been heard of, and that the ship and crew which saved him and carried him to Australia should have at the same time vanished utterly out of existence; that Books should have given up his fortune and family for the sake of spending his life in folling bullocks and cutting up pigs; that he should have lost his native tongue so completely that he should have lost his native tongue so completely same so could not even pronounce his mether's Christian name, of which, indeed, he was ignorant until he looked in a book; that he should have absolutely forgotten all about his childhood, his school-days, his holidays at the houses of his relatives and all the most touching and sagned passes of relatives, and all the most touching and sacred par

his life. As if this were not enough, it was made part of Claimant's case that the opposition to him was a repired of Jesuita and that all the members of a distinished family had combined to perjure themselves from lignant hatred of a relative and friend. An elastic ition to him was a the Claimant's con alignant he lity, however, can awallow anything, and the very difficulties of the Claimant's case seemed only to strengthen the faith of his adherents. They fastened upon the monofit, as if from his own personal knowledge, and his acquisition of which had not been clearly made out; and shutting their eyes to everything on the other side, they in-sisted that unless these were explained away, the Claimant must be held to be Rooms. It is difficult to resist a feeling of regret that no means exist of punishing the almost criminal standity which supplied the impostor with the necessary leverage. It may be said that stupidity is a misfortune and not a fault; but there is a sort of cranky, cantankerous, pragmatical stapidity which sets itself up as superior to all plain and obvious considerations, and claims the gift of seeing through stone walls and of proving that two make four only for common folk, which is really an offence against decency and reason. There are people of this kind who can bring themselves to believe anything; and ARTHUR ORTON may take his place by the side of the Cock Lane ghost, the sea serpent, and Mrs. Torr's litter of rabbits. The sham Dauphin who could speak German but not French is another freak of the same sort; and at this moment, we believe, a joint-stock company is in existence for working the Derwentwater estates in the name of the funny old lady who calls herself Countess. Human folly is perennial and inexhaustible.

Whatever else may be said about the Tichbonne case, it must be admitted that it has been in every way a marvellous exhibition of the morbid anatomy of human nature. All sorts of follies, frailties, and eccentricities have been exposed under its searching light. Not only ORTON and the witnesses, but the counsel and attorneys, the jurymen, and even the judges have been part of the show, which also included the general public out of doors. The prevalent confusion of mind with regard to the character of Orton was grotesquely displayed in the resentment of the mob at the exclusion from the ranks of the aristocracy of a man whom they could not help recognizing as one of themselves, and in the ridiculous and unreasonable indignation of even some educated people at the epithets which the Solicitor-General applied to the Claimant. What Sir J. COLHRIDGE undertook to prove was that the Claimant was not ROGER TICHBORNE, and it necessarily followed that, if he was not Roger, he was an impostor, perjurer, forger, and scoundrel. When a question of title to property turns on the interpretation of a deed, it is possible to suppose that both parties may be honest, though one of them is mistaken. There was no room, however, for mistake on the Claimant's part, and therefore he was either Sir ROGER or a villain. There can be no doubt, we think, that the excited public opinion in regard to this case has in many ways thrown difficulties in the way of justice. The truth is that the Claimant for a time became a sort of amusement to large classes of people, a subject for talk and betting, and that men took sides for or against him pretty much as they might back a horse at a race, on the impulse of the moment, because the colour took their fancy and without knowing anything of the merits of the animal. There was also a disposition to look not unkindly on one who was contributing so much popular sport, just as one might do on an entertaining villain on the stage or in a novel. FALSTAPF is by no means a moral character, but he is forgiven for his fun; and the ARTPUL DODGER and JACK SHEPPARD are applanded without reference to their professional practices. In fact the whole case has been like a romance, unrolled chapter by chapter in the sourts of law, with new and surprising incidents always occurring to diversify the main plot. The result has been to produce in many minds not only a false and morbid sympathy with the Claim-ant, but also a reckless and unconsidered judgment in his favour. It has elso perhaps had a somewhat unwholesome effect on the manner in which the inquiry has been conducted. It is impossible not to see that almost every one ducted. It is impossing and to see sing minost every one somected with the case was impressed with the idea that this majoret an ordinary case to be gone about in the ordinary of the world were upon it, and

that very great things were expected all round. Hence a flavour of histrionics has rather tainted the proceedings. There has been too much performance, and vastly too much speaking. It is an insult to common sause to suppose that all this talking was necessary to elucidate a su ect which the jury must have known by heart. SOLICITOR-GENERAL'S twenty-one days may be excused on account of the fresh ground he had to break, and nothing could be more admirable as examples of forensic precision and brovity than Mr. HAWKINS'S addresses. But Dr. KENEALT'S forty-seven days of wild ravings and disorderly violence were a monstrous waste of time, which ought never to have been tolerated; and with all respect for the CHIEF JUSTICE, we cannot help thinking that he might perhaps have advantageously shortened his eloquent summing-up. The whole gist of the case lay in his concluding observations on Saturday morning, and if he had given two or three days to a preliminary exposition, it would, we think, have fully answered every judicial purpose. In the course of the case many twaddling and irrelevant discussions on points of literary quotation, and on such absurd questions as whother it should be taken for granted that a man who had read PAUL DE KOCK'S novels would be sure to seduce his cousin, might have been checked with advantage to the dignity of the Court as well as for the sake of valuable time. was also an odd touch of after-dinner oratory in the complimentary specchos and votes of thanks—though the ushers and policemen were mentioned, the gasmon and the old woman who sweeps the Court were somehow forgotten—which closed the trial. The dramatic elements of the case were perhaps a little too much for everybody concerned.

On the whole, we do not think that the presecution which has just closed can be regarded as a happy example of the firm, intelligent, and business-like administration of justice. The country has been denied the legitimate satisfaction of seeing an impudent crime promptly and sdequately punished. It has taken soveral years to complete the exposure of a flimsy and transparent deceit; and at the last the chief offender, or at least the chief actor in the plot, gets off with fourteen years' imprisonment, while for the present at any rate his accomplices escape punishment altogether. It was unfortunate that Onton should have had so long an interval after his arrival in England to collect information and to mystify witnesses; but this may porhaps have been unavoidable in the poculiar circumstances of the case. There can be no doubt, however, that if, at the close of the civil suit, Ouron had at once been committed to take his trial in the ordinary, every-day way at the Old Bailey, he might have been relegated to appropriate obscurity without dolay, and without any of that parade and ceremony which have reflected a false importance upon a very vulgar sort of scoundrel. The money which has been expended on the trial is a very small matter. It is obvious that there was a difficulty in confining the case to a few selected issues, and it was desirable that the whole fable should be thoroughly exploded, once and for all. It is conceivable, however, that this object might have been attained at the Old Bailey quite as well as in the Queen's Bench, and that in many respects the evidence, and still more the talking, night have been brought within a more reasonable compass. It was supposed that there would be a great advantage in having three Judges, as a strong Court would thus be constituted which could firmly and peremptorily regulate the course of procedure; but it is doubtful whether this expectation has been satisfactorily realized. It is impossible to suppose that the remarks which the Chief JUSTICE, with the concurrence of his colleagues, directed against Dr. KENEALY and Mr. HOLMES, the solicitor, will not be followed up by any practical consequences. If a Judge is of opinion that an attorney has been engaged in "a most disgraceful transaction," he has power to deprive him of the opportunity of again abusing his position; and a barrister who insults the Bench, misrepresents witnesses, mis-states evidence, perverts "facts" in order "to key the foundations of foul im-"putations and unjust accusations against parties and "witnesses," should either be punished straightway for contempt of court or reported to the Benchers of his Inn. It may be presumed that those who served the purposes of the impostor in other ways will also receive attention. As for Orrow, it is to be hoped that the newspapers will pluck up a little self-respect, and be content with what they have already made out of him. Mr. WHALLEY and Mr. GUILDFORD Ossion may possibly be interested to know that "ha

"sleeps wonderfully well, and, on the whole, takes kindly "to his skilly, though he rather fails in picking cakum"; but it is surely disgusting that this toadying of crime should be thrust upon the public.

THE FRENCH ELECTIONS.

THERE is a curious want of connexion between the acts of the French Assembly and the acts of French electors. The electors evidently know their own minds. They have a clear conception of the type of man by whom they wish to be represented, and they lose no opportunity of letting the Assembly understand what this type is. Whether a Conservative Republic be a possibility or not, there can be no question that a great number of Frenchmen are now firm believers in it. When M. THERS first asserted this, he was supposed to have mistaken the traditional accepthe was supposed to have mistaken the traditional acceptance of the powers that he for a distinct preference in favour of a particular kind of power. Those who held that he made this blunder could point to the fact that the majority of Frenchmen had always acquiesced in the Government reigning in Paris, and had never shown any active desire to see that Government make way for another. M. Thiers was obeyed because he happened to be the master of France for the time being. If he coased be the master of France for the time being. If he ceased to be master of France, the popular support would be transferred as a matter of course to the Government which succeeded him. The policy of the Duke of BROGLIE in the matter of the partial elections has supplied the means of testing the truth of these two theories. If the vacant seats in the Assembly had all been filled at once, the return seats in the Assembly had all been filled at once, the return of twelve or fourteen Republicans would have proved nothing. The adversaries of the Republic would have been able to attribute it to the unexhausted influence of M. Thers. They might have made merry over the stupidity of the peasantry in not recognizing the signs of political death, and have described with much humour the astonishment in story for them when they found that the distance ment in store for them when they found that the dictator they had supposed themselves to be supporting had, since the 24th of May, been no more than other men. The Duke of Broglie sacrificed this advantage in the belief that a yet greater one was within his reach. He thought that as soon as the constituencies had come to understand what the substitution of Marshal MacManon for M. Thiers really meant, they would follow suit with their customary readiness. Consequently he put off the elections for the vacant seats to the most distant days allowed by law, intending to show by a series of Conservative victories that the Republicanism which M. THEES had alleged to exist among the peasantry had no better foundation than the Imperialism in which the partisans of the late dynasty had put such mistaken trust. One election after another has come to discredit the Duke of Broglik's knowledge of his countrymen. If it were true that the peasantry are ready to support any Government so long as it is in power, the Duke of Broatie's position would be an unusually strong one. He has the confidence of Marshal MacManon, and Marshal MacManon has the confidence of the army. Open resistance of any kind is consequently impossible, and Frenchmen are not commonly good at opposition which stops short of open resistance. A great part of France is in a state of siege, so that the fact that the Government has the support of the army is very clearly brought home to the people. If they wish to support the Ministry by their votes, they can be at no loss how to do so; for the Duke of BROULIE has kindly provided them with an army of prefects and mayors, whose principal duties are to tell the electors how they ought to vote, and to do all they can to ensure their voting as they ought. By these means the conditions of the experiment have been rendered singularly favourable to the production of the result which the Duke of BrogLie desires to get from it. Yet with all these advantages on its side the Government has been beaten in one election after another. Instead of showing itself willing to support the de facto authorities, the country has taken every occasion of making it clear that all which the de facto authorities have to expect from it is submission until such time as resistance becomes prudent. It is in vain that the Duke of Broglie declares that France needs seven years of political inaction to give her that knowledge of her own mind which can alone fit her for the responsible work of deciding upon her political destiny. Every fresh election embodies a counter declaration on the part of the nation that France knows her own mind already, and has resolved that her political destiny is to live under a Conservative Republic.

The latest of these declarations is the return of M. LEPETT for Vienne. Several circumstances combine to give this election singular importance. It is far more than an instance of the maintenance of Republican convictions under discouraging conditions. It is an instance of the creation of Republican convictions under discouraging conditions. In February 1871 the department, of the three Legitimists by an enormous majority. In July 41 71 an anti-Republican deputy was returned, though by a diminished majority. And now in March 1874 the Republican diminished majority. And now in March 1874 the Republican candidate has beaten his opponent by some four thousand votes. The anti-Republican candidate is the brother-in-law of one of the sitting members who has spent money freely in his cause, and he has had the support of a new prefect and several new mayors, all of whom have been encouraged by the belief that they could win if they only worked hard enough. A letter from M. Thiers himself helped to decide the battle, so that by the time the day of election arrived the struggle had insensibly become a trial of strength between the present and the late Governments on a field which, if the choice had rested with them, the former would have preferred before all others. M. LEPETIT had no special title to Republican support, and, in the first instance, few of his friends did more than speculate on the probability of his making a respectable though unsuccessful fight. A true instinct led M. THIERS to divine that his interposition was just what was needed to convert decent defeat into conspicuous success. He wrote to M. LEPETIT to say that his own faith in the triumph of the Conservative Republic was unaltered, that he believed the country was as unchanged upon this point as himself, and that if the electors would go on sending up representatives who would enlighten the Assembly without alarming it all would go well. The electors of Vienne were satisfied. If M. Theres was willing to give M. LEPETIT a cortificate, they felt that they need require no other testimony to his qualifications. In this way the election became an expression of their confidence in M. Thiers as well as of their adherence to the Republic. As such, the result is peculiarly irritating to the Ministry. The fact that, in spite of their majority in the Assembly, M. There's name is still the only one which it is any use to conjure with in the country affords but a poor prospect for the dissolution which must come sooner or later

The comments of the Ministerial and Monarchical organs on this election show how greatly it has discomposed them. One journal tries to cheer its readers by reminding them that in former elections the Republican majorities have been greater, concealing the fact that these elections took place in other departments, and that in Vienne this is the first time that the Republicans have gained a majority at all. In other quarters a more frankly gloomy view is taken. It is clear, says one writer, that the whole of France—the country just as much as the towns—is honeycombed with Radicalism. The Legitimist Union comes nearer the truth than most of its Conservative contemporaries. The elections of Sunday, it says, have shown the impotence of the Government. It has turned the municipalities upside down, and proclaimed that its power must not be challenged for seven years, and the only answer the constituencies have given is to return M. LEPETIT and M. LEDRU ROLLIN. Thanks to its efforts, the bewildered country has come to regard the Republic as the one system that can put an end to the present order of The elections are the energetic protest of the people against the seven years of uncertainty and suffering to which they have been condemned by their rulers. The next day, it is true, some of the Ministerial journals re-covered their spirits a little, and cheered themselves with the reflection that after all the majorities by which M. LEPETIT and M. LEDRU ROLLIN have been returned are not very large. In both cases, however, there were special causes at work which explain why they were small. In Vienne, as we have seen, it is the first time that the Republivienne, as we have seen, it is the first time that the Republicans have had a majority, and the fact that they have beaten their opponents is, under the circumstances, far more conspicuous than the qualifying fact that they only beat them by about four thousand votes out of a total vote of some fifty-eight thousand. In Vaucluse the analmess of the majority is due to the fact that many moderate Republicans refused to note for M. Lengue Rouse. To itself this is fairthing disvote for M. Ladru Rollin. In itself this is fraction discouraging. It proves that even in one of the matt Radical departments it is not safe to dissegure the opinions of the

moderate section of the party. A candidate of less pronounced hus would have carried all before him, whereas M. Langu Rollin was elected by so small a majority as to make it plain even to the most obstinate fanatio that by the obsting of so impracticable a politician the Republican Communication had very nearly given the department over to the monarchists.

EDUCATION AND POLITICAL PARTIES.

THE Education League possesses in an eminent degree the characteristic of not knowing when it is beaten. The Executive Committee declare that the elections, though adverse to the Liberal party, have resulted in a numerical gain to the League in the House of Commons. It seems surprising at first that they should have thought it necessary to insert the qualifying clause. The ingenuity which regards the Parliamentary prospects of the League as improved by the dissolution might have easily discovered some recondite sense in which it would be true that the elections have resulted in a numerical gain to the Liberal party. When, however, the process is unveiled, it turns out to be rather bold than subtle. "Taking the 25th Clause "as the symbol of the controversy," the highest vote the League got in the late House of Commons was 132, whereas "in the present House of Commons there "are 167 members who have declared themselves favour-"able to the repeal of that clause." It may be suspected that when the division comes to be taken on Mr. RICHARD's promised Bill, these 167 will have dwindled down to a figure considerably less than the 132 which Mr. CANDLISH could claim in 1872. Among the 167 members who have "de-" clared themselves favourable to the repeal of the clause' are probably included all those who professed dislike to the clause in its present form. There are many Liberals, and perhaps not a few Conservatives, who are able to say as much as this. To invest School Boards with the duty of ascertaining what parents are able and what parents are unable to pay the school fees for their children is undoubtedly a most unfortunate provision. In this sense we are as much opposed to the 25th Clause as the Education League can be. We will go further, and say that we could quite afford to see the clause repealed, provided that it were repealed in its entirety. Supposing that the law compelled every child, who was not otherwise receiving instruction, to be sent to school, and that School Boards were not allowed either to pay fees at voluntary schools or to remit them at their own, the result would be this. When a parent who did not send his child to school was prosecuted and pleaded poverty, he would be told that in a country provided with a Poor-law poverty is no excuse for the omission. A man who is prosecuted for not giving his child enough to cat cannot escape in this way. The magistrates tell him that how he is to find the money to pay for the food is a matter which he must settle with the Guardians. All that the magistrates have to do is to see that the child gets the minimum of necessary sustenance. In the same way, under a system of compulsory education with no 25th Clause, it would be no affair of the magistrates how a parent found the money to pay for his child's schooling. That would be the Guardians' business. child's schooling. That would be the Guardians' business. It would be enough for the magistrates to know that there was an authority in the background from whom in the last resort the required relief was to be had. To repeal that part of the clause which empowers School Boards to pay school fees in voluntary schools, while leaving intact the part which allows them to remit fees at their own schools, would be a wholly different matter. In districts in which compulsory by-laws were not in force, an indigent parent who wanted to have the benefit of his child's services or wager would decline to send him to school, on the plea that he could not conscientiously avail himself of the School Board school, and that the School Board had no power to pay the fee for him at a school which his conscience would allow him to use. Instead, therefore, of being looked upon as rather a black sheep for postponing his child's advantage to his own, he would take local rank as a confessor in right of his fine sense of theological ortho. doxy. In districts in which compulsors by laws were in force they wond the become so unpopular as to be virtually unworkable. A parent who was too poor to pay the fees at a voluntary school would be forced to send his children is a school parkage two miles off, while his neighbour who would something something accountry person had an equally good

school within a quarter of a mile. Yet, if the School Board retained the power of remitting fees, the Guardians would not be able to make the money for schooling a part of their relief, and the magistrates would consequently have no choice but to drive indigent children to the School Board schools at any sacrifice of convenience or comfort either to themselves or their parents. In practice such a system would prove simply impossible.

We have gone over this familiar ground once more in order to show the fallacy of the League's assumption that the 25th Clause is the symbol of the controversy between the defenders and the assailants of the Education Act. It is nothing of the kind. The 25th Clause might be done away with altogether—in the way we have suggested it night be beneficially done away with altogether—and the gulf between the two parties might remain as wide as ever. It proves nothing therefore that 167 members of the House of Commons have declared themselves favourable to its repeal. There is a sense in which Mr. Foretan himself is favourable to its repeal. There is a sense in which every one who wishes to see education made universal without any further lessening of the independence of the working classes must be favourable to its repeal. The real symbols of the controversy are not the 25th Chuse, but the 7th Clause and the 14th. The first of these allows public money to be given in support of Denominational schools provided that they accept the Commission national schools provided that they accept the Conscience Clause; the second allows School Boards to teach any religion they like in their achools provided that they accept the Conscience Clause and do not use the distinctive formularies of any denomination. If the Education League wish to show any real progress in the House of Commons, they must produce 167 members who will vote for the repeal of these two clauses—will vote, that is, for withdrawing the million or thereabouts which is now paid over every year to Denominational schools, and for making all School Board schools secular. When a man says that tears are his meat day and night because 5,000l. is paid out of the rates for the education of a few hundreds of indigent children in Denominational schools, he has no claim to be listened to unless he is equally hot against the payment of 1,000,000l. out of the taxes for the maintenance of these very schools at which his conscience will not allow him to pay the fees. When this same man tells you that his conscience is harrowed by the thought that money taken out of the pockets of the ratepayers goes to the support of voluntary schools in which religion is taught, his sensibilities are not worth much if he is not equally distressed at the thought that money taken out of the pockets of the ratepayers goes in almost every school district in England, except Birmingham, to maintain School Board schools in which religion is taught. If the Education League are well advised they will not talk of their electoral victories till they have started a few candidates pledged to withdraw every shilling of public money from voluntary schools, and to forbid the teaching of religion in any School Board school. If they can carry, not 167 members, but a fourth or an eighth of that number, we will concede that their cause is gaining ground.

There is only one thing that could make such a result at all probable, and that is that the Government should show itself hostile to the extension of the Education Act on the lines of the original measure. By the principles of the Education Act the majority of the Liberal party, including in that name many who have for the time been frightened into the Conservative ranks by the impracticable violence of the Secularist Discenters, understand three things—the bringing elementary education within the reach of every child in the kingdom, the utilization for this purpose of all efficient existing schools, and the liberty of local majorities to have their religion taught in School Board schools, provided that it be done under proper safeguards to the consciences of local minorities. The Act of 1870 secures the second of these objects entirely, and it secures the third in substance, though the illegical Cowpertering Clause provents it from securing it in form. But it secures the first only imperfectly. This imperfection does not spring from any defect in the provision of schools. Under the Act there will before long be school seconomodation for every child in the kingdom. But to bring a school within reach of every child is not to bring education within the reach of every child. A child most actually be sent to school before this latter object is strained. What is wanted therefore to make the Act of 1870 really effective is to make the provision for

enforcing school attendance compulsory instead of permis-A Conservative Government has opportunities of doing this greater in some respects than could have fallen to the share of the Liberals, because a Conservative Government can control and silence most of the really formidable resistance which such a measure would be likely to excite. If the Conservatives lay hold of these opportunities, they will raise education above the level of party politics. If they let these opportunities slip, they will enable the League to declare that the Secularists are the only party really in earnest about education, and when that statement is once accepted as true, the victory of Secularism will be only a question of time.

ARTHUR ORTON.

PEOPLE who take their ideas of life and human nature from I the popular novelist are led to suppose that transcendent villany is usually associated with a certain savage grandeur of character and considerable intellectual resources. Those who character and considerable intellectual resources. Those who study the criminal classes at the bar of the Old Bailey or in the pages of the Newyote Calendar are aware that they are, for the most part, a very vulgar and unheroic set of people. Arthur Orton is hardly an exception to this rule. Some years ago Miss Braddon wrote a novel the plot of which turned upon the successful personation of a wealthy banker by a clerk whom he had used as a tool and then betrayed. The banker has just returned from India after a long absence from home. The clerk murders him, passes off his victim's body as his own, and assumes his name. He gets hold of the dead man's journal and letters, sits up night after night studying them, and making notes of their contents, and plays the part marvellously, showing a close acquaintance with the banker's affairs. Of course the impostor is "a handsome man—a very handsome man, tall, and aristocratic-looking, with a certain haughty grace in his character and considerable intellectual resources tall, and aristocratic-looking, with a certain haughty grace in his manner that harmonizes with his looks." "His nose"—one might manner that harmonizes with his looks." "His nose"—one might be sure of that—"is aquiline, his forehead high and square, his chin massive"; and "the form of his head and face denotes force of intellect." It is known that Miss Braddon numbers Arthur Orton among her warmest admirers, and that in Australia he refreshed and fortified his mind with apophthegms selected from her works. He may possibly have read Henry Dunbur, and have derived from it the idea of his wicked enterprise. At any rate it is instructive to compare the romantic villain of the novel with the pressic villain of real life—the coarse, common, ignorant reque whose extraordinary imposture has made him famous through the world. Handsome he cannot be called, nor aristocratic-looking. A swellen, bloated countenance, him ismous through the world. Handsome he cannot be called, nor aristocratic-looking. A swollen, bloated countenance, flabby checks, and a girth of lifty-six inches, a shambling gait, and mean, furtive glance, scarcely correspond with the haughty grace and beauty of the hero of flotion. Nor can he boast of the intellectual force with which the novelist endows her creation. One of the strangest illusions of this case is the idea that Orton bears the faintest resemblance to a gentleman. He is certainly bears the faintest resemblance to a gentleman. He is certainly not the rough shaughterman of the shambles, but he is equally remote from anything approaching to the conventional type of gentleman. In his mich and manners he carries the stamp of boorishness and vulgarity, and his behaviour under a false name has been quite in accordance with his appearance. He looks indeed exactly what, from his life, one would expect him to be, deductions being made for change of dress and the cares of the karber. Until he began this imposture he was living in a loose, vagabond way, by no means nice as to his company, and probably not more particular as to the means of picking up a livelihood. He appears to have been a lazy, loating sort of fellow, fond of his case, and with a certain good-natured plausibility of manner which secured him friends, but underneath which lay a good deal of savage passion, and a strong, resolute, and daring will of the most determined criminal type. It was observed in Court that when angry he had a very black and dangrous look. He has great nerve and coolness, and a certain quickness of apprehension, but apparently no foresight or capacity for sustained or reasoned thought. He started with no clever, well-planned scheme; his falsehoods displayed no subtlety of artifice, named scheme; his intended displayed to shotsety of article, no spark of imagination or ingenuity; and after the first step in the imposture he was content to drift indolently along with it, taking things as they came, and leaving all the work and trouble to others. It is interesting to observe with how extremely little intelligence and cumning a great crime can be committed, and

little intelligence and cuming a great crime can be committed, and a large body of people gulled.

The story of Arthur Orton is really the story of a very commonplace cheat who, trying to swindle a few pounds out of a colonial attorney, was audienly launched, not only without settled purpose or coherent plan, but almost against his will, on one of the most monstrous impostures of modern times, and found it easier to go on than to turn back. From his boyhood there seems to have been a great deal of the Gascon about Orton. At Melipilla he endeavoused to make himself important by saying that he was the son of the Queen of England's butcher. At Wapping he used, after his first return from sea, to swagger shout with a gold-laced officer's cap, which he had of course no sort of right to want One can conceive how readily a lragging, vapouring fellow of this high would fall into a romance about his means and

his family if there seemed to be any chance of its helping him to a little ready money to relieve his necessities. It is quite clear that in the summer of 1865 Orton found his position at Wagga-Wagga utterly wretched and hepeless, and if he could only have got a small sum out of Gibbes to enable him to make a fresh start somewhere else, the Tichborns impossible would in all probability never have been heard of Gibbes, however, though he liked gossip, was hard to bleed, and vague hints made no impression upon him. It would be just about this time that Slate, the Hampshire man, came back from Sydney with a copy of the newspaper containing Lady Tichborne's advertisement, and pointed it out to Orton. Orton had now something tangible to work upon. He became more precise in his communications. The property—at first only a farm, or something of that kind—aveiled into a large estate, with which a title was connected. He hinted that shipwreck had given him a terror of the sea, and incidentally referred to the climate of South America. The advertisement would of course help him to this; and when Gibbes himself afterwards saw the advertisement, not knowing that Orton had been before him in that respect, he naturally assumed that his client must before him in that respect, he naturally assumed that his client must be the missing Roger. In some respects Orton corresponded to the description in the advertisement. It was stated that Roger at this description in the advertisement. It was stated that Roger at this time would be about thirty-two years of age, and that he was of a delicate constitution, rather tall, with very light brown hair and blue eves. Orton was over thirty-one years of age, rather tall, with light brown hair, and bluish or grey-blue eyes. He was not apparently of a delicate constitution, but that might be accounted for by his having become more robust in the course of his travels. It is possible that Orton now looks back on this advertisement as a trap that was set for his innocence. It happens that, though it was drawn up under instructions from Roger's mother, it applies much more nearly to Orton than to Roger, for Roger was not tall, and his hair was very dark brown. Moreover, the agent who sent the advertisement to the newspapers had accidentally omitted rather an important word in Lady Tichborne's description—the word "thin." Orton was exceedingly corpulent, and he had no warning at this time that exceedingly corpulent, and he had no warning at this time that Roger was thin. Afterwards he found it easy to ascribe his bloated size to the improvement in his health. Gibbes's evidence is so loose and confused as to dates that it is impossible to say exactly when Orton made up his mind to give himself out as Roger Tichborne. It should be observed, however, that until after the advertisement was published Orton never hinted to any one that he was Roger; that even after he had led Gibbes to assume that the letters on the pipe were the initials of his name, he hesitated to commit himself by a direct assurance on the subject, and that he bound Gibbes over not to reveal the secret until the following March. It is also clear that at this time he was simply practising on tribbes with a view to extract a loan, and that he had no intention of carrying the matter any further than might be necessary in order to acquire Gibbes's confidence and to get some money out of him. It was not till some months afterwards that he consented to write to Lady Tichborne.

Thus we find Orton gradually drawn on by his importunate and increasing necessities, by the temptation of a misleading advertisement, by Gibbes's constant appeals to him to declare himself as ment, by (tibles a constant appears to him to declare himself as Roger Tichborne, and afterwards by the extreme exgerness which the Dowagor betrayed in her letters to recognize almost anybody as a son. (iibbes and Cubitt, the Missing Friends' agent, knew nothing about Roger, and were only too willing to believe anything which would help them to a reward from Lady Tichborne. Or or could romance with them to almost any extent without fear of detection. It was a critical moment when he was confronted with a friend of the Tichborne family at Sydney; but here again the way was smoothed for him. Mr. Turville had never seen Roger, and he amoothed for him. Mr. Turville had never seen Roger, and he does not seem to have been staggered by Orton's statement that Lady Tiehborne, whom Turville knew, and who was the very ghost of leanness, was a big, stout woman. Here was nother temptation, and the poor rogue slid down another step into the hole which, as perhaps he now argues with pity for himself, circumstances were digging for him. He had raised some money in Sydney, and there was a fair chance of money being also extracted from the old Dowager. The Dowager puts him up to Bogle, and here the devil gives him another shove on, for in Bogle he finds just that stock of information which was wanted to give him some shadow stock of information which was wanted to give him some shadow of appearance of being Roger Tichborne. In England he plunges more holdly into the imposture. Rous, the ex-cloris of the family solicitor, and Baigent, the hanger-on and historian of the family, are both by his side. The Dowager's adhesion is secured; and this brings over Mr. Hopkins. Carter, Roger's private servant, and M'Cann, his military servant, are soon added to the staff. At every turn Orton finds unexpected assistance and support, and everything seems to conspire to push him on in the imposture to which he had committed himself. If on his arrived in England he had obtained a good round sum from the Dowager, he would probably have tried to get away with it; but the Dowager was poor and not blessed wish much ready money, and the Tichborne estates seemed to lie within his grasp. A dull, ignorant man, surprised by the extraordinary case with which he had got thus far, would naturally be led to make light of all the other difficulties in his way. Afterward when these difficulties became more superent, he may have had integrings but flight would have been a confession of guild, and he was too highest complements to describe in describe he with his property.

It is meetings to describe in describe huilding up of the plot solicitor, and Baigent, the hanger-on and historian of the family,

of Roger's will as privately process all metions com Official papers w ned from the Horse Guards, giving an account of pacted with the service of Roger Tickborne, and of his regiment. These documents mentioned sil matters connected with the service of Roger Tichtorna, and the movements of his regiment. These documents mentioned the movements of his regiment. These documents mentioned the movement of his regiment. These documents mentioned the movement of chief and the places where the regiment was stationed, and various other particulars. Roger's wolmainous correspondence, of which Orten may have obtained more than has been produced in evidence, would also supply many details of his military life. Moreover Roger was a very precise, careful man; he kept all his old bills, and had all his old clother packed away against his return home; and here again would be useful materials for filling up his history. A list of the masters at Stonyhurst was obtained for Orton's use, but no serious attempt was made to work up this part of Roger's career, nor would it have been easy to do so. Elaborate researches were also made at Lloyd's and elsewhere to discover as Ospery, or a Thems, or any other vessel that rould be made to answer for the one alleged to have rescued Roger and part of the crew of the Bella. With his active resound Roger and part of the crew of the Bella. With his active decay birds and all this mass of materials, Orton had every chance of picking up scraps of gossip in order to entrap witnesses into recognition; and one witness made many. Whenever a witness recognition; and one witness made many. Whenever a witness was known to be coming, one or other of the acoute was told off to see to him. The affidavits were drawn so as to support and strengthen each other, and, as the Chief Justice said, "the statements made by different witnesses were in several instances most materially expanded, enlarged, and improved under the skilful manipulation of Mr. Baigent." Putting these circumstances together, it is easy enough to understand how Orton was conched and crammed for the part he had undertaken. And if proof had been wanting that his knowledge of Hoger was wholly the result of this coaching and cramming, it would have been found in the confusion and blundering into which he tell in attempting to repeat his lessons, and the strange blanks in his memory. He knew only what the troopers of the regiment knew, and generally contrived to take hold of their stories by the wrong and. A man who had been only a short stories by the wrong end. A man who had been only a short time in the army might after the lapse of years certainly grow hazy as to the details of drill, but it was incredible that he should be ignorant of the existence of such a person as Lord Fitzroy Someract, especially as Lord Fitzroy had given him his commission on a personal application from himself. It was equally incredible that an officer who had passed an examination should say that a "professor of fortification" taught him "the landmarks of England," and that "the landmarks insignate the formation of England land," and that "the landmarks insumate the formation of England at different points along the count, which every officer is bound to learn before he can pass." When Orton was asked about the disposition of the Tichborne proporty, he was quite at sea, although it is certain from Roger's letters that Roger had a clear and minute knowledge of the subject. Moreover, the greater part of Roger's about life was a terra inequality to him. Nothing can be more conclusive than the fact that Orton was wholly ignorant of Roger's life down to the time when Roger was alloud. ignerant of Roger's life down to the time when Roger was about twenty years of age. The reason is of course simply that he had twenty years of age. The reason is of course simply that he had no one to tell him anything about it. These twenty years were spent chiefly in Paris, at Stonyhurst, and at Knoyle, and Bogle's knowledge was confined to Tichborne and Upton. Of Roger's military service Orton was able to put on an appearance of knowledge, but this knowledge was confined to such matters as would fall within the common goesip of the barrack-yard, or could be extracted from official papers or letters. Roger's comings and goings at Tichborne, and the external circumstances of his visits, would of course be under the observation of the servants; but Roger would not be likely to take his uncle's valet into his confidence in regard to his love for his course, and the "diplomacy" of his aunt, and therefor his cousin, and the "diplomacy" of his aunt, and therefore—just as one might expect—Orton's mind was a blank on these subjects. He did not know that Reger used to write constantly to his sunt—a letter at least once a fortnight—the constantly to his sunt—a letter at least once a fortnight—the correspondence being continued down to the very time of his disappearance, and relating to the one subject which above all others engrossed Roger's thoughts—his attachment to his consin, and the chances of his marrying her. In the servants' hall it would be well enough known that Roger was "sweet on young miss," and that is really all Orton knew. As for the "soaled packet," it is enough to say that it is not only one of the most wicked and inflamous but one of the most wicked and inflamous but one of the most retained acceptance in the could infamous, but one of the most utterly absurd, stories that could possibly be invented. It is clear that, apart from her doubts as to the stability of Roger's character, Lady Doughty had many reasons for desiring a union between the cousins; and, if these had been any truth in Orton's abominable suggestion, it would have neces-

any truth in Orton's abominable suggestion, it would have necessarily precipitated a marriage.

There are different tests which may be applied to such a story as Orton's. There is first the question of what the pretender knows of the man he pretends to be, and of his surroundings; and it is quite clear that here everything pointed against instead of in favour of Orton. Up to the time he got hold of Rogie in Sydney—that is, mearly a year after he had first disclosed himself to Gibbes at Wagga-Wagga as the lost Hogse—he was perfectly in the dark as to all Roger's antocedesms, except in an far as he had picked up some story facts from the advertisemental the newspapers, the Barusstage, and perhaps from talk with Blete, his Hampshire Iriend. He did not know where Roger was been, where he was educated, what his connection with the army had been, where the facility matter were; he have nothing of his andle His Bletched, or of lighton. Add, to him the army had been, where the facility matter were; he had the army had been improbability direct, that Roger should have

been saved from shipwrack when not another survivor had ever been heard of, and, next, that he should have alandoned his family and his fortune for the sake of becoming a journsyman butcher in Australia. If Orton could only have been impounded at this time, and subjected to examination without having the means of obtaining any information from outside, there would at once have been an end of his case. It was so glasing and obvious an imposture that it would have broken down after a very few questions. All the difficulties of the case have sriven from attention not having been sufficiently contined to Orton's original story as it was first put forth by himself. Afterwards it was enlarged, corrected, and dressed up in various ways, and went through a number of revised editions. But in these later forms it had ceased to be Orton's own story, and had become a sort of joint-stock romance, made up of materials contributed by a great many different people, and licked into shape by sharp and unscrupulous agents. Even then it was an imperfect and incoherent tale, and Orton blundered constantly in trying to repeat it. The knowledge which he had acquired added a little mystery to the affair, but could not possibly affact the irresistible conclusion which must be drawn from the utter blankness of his maind in regard to Roger's life and all that concorned the Tichborne family down to the eve of his departure from Australia. His counsel indeed had no alternative but to ask the jury to believe that a life of vile excesses had ruined his brain, and that his statements were worthless as evidence.

Then there is the question of personal resemblance. This is a matter on which evidence should always be received with the greatest heaitstion and suspicion. There is nothing more decaptive than impressions of personal appearance, especially after a long interval; and it may also be said that nothing can be more absurd and misleading than the sort of explanations which are usually given of the grounds of such impressions. It will sometimes happen that the general impression is correct, although the details given are wrong, or on the other hand that some of the details may be correct while the impression is erroneous. The truth is that very few persons have the faculty of close analytical observation which is indispensable for a sound judgment on a question of this kind. People do not spend their time in scanning other people's countenances, noting the colour of their eyes or hair, the curve of their lips, or the shape of their nesses. Miss a simple test to try to recall any of those details in the case even of an intimate friend whom one is in the constant habit of seeing. There is probably not one person in a thousand who can tell the colour of anyhody's eyes, except perhaps his wife's or child's. Evidence of identity is worth nothing unless it is the confident impression of some one who has been in close connexion with the person to be identified, and who has had such an interest in him as would be likely to fix the impression on the mind; or unless it applies to some marked peculiarity of feature, tigure, or expression. Highly idealized portraits of lieger have been drawn in the course of the two trials. He scoms in roulity to have been about as uninteresting and commonplace a person as can be conceived—a shy, thin, sallow, lackadaisical-looking youth, amiable and gentlemanly, but without any marked chiracter of any kind, except some resolution and some adhishness; just the sort of young man, in fact, whom one might ment a dozen times a mouth without carrying away a distinct impression of him. There can be no doubt that he lad about the eyes the sort of sentimental, spoony look which is vulgarly associated with the gaze of the "dying duck," and which Orton also at times puts on, and this was probably all that most people recollected of poor Roger, who was as far as possible from being a hero either in look or bearing. The fact that Lieger was thin and Orton enormously stout does not go for much, as men change in that way. Orton is taller than Roger, however, and men do not grow taller after twenty-four. His hair is lighter, his cars are wide and flapping; Roger's cars were thin and adhered to the check. Roger had tattoo marks which Orton has not, and Orton check. has a brown mark which Roger had not. It seems to us that the greater part of the evidence on both sides as to personal resemblance is really of no value whatever. Roger's relatives and friends, and his fellow-officers in the regiment, may be trasted in their general impression of him; and it is impossible to doubt that Arthur Orton's sweetheaft, Miss Loder, Mrs. Jury, who was not only a relation but a creditor, the people who befriended Orton in Melipilla, and his employers in Australia, must recollect him perfectly. The rest of the personal evidence is worthless, and much that the Westing of the Continuous and the Continuous and manufactured the Westing of the Continuous and the Con both of the Wapping and the Carabineor evidence was almost an insult to the intelligence of the Court. Not a few of the witnesses professed to speak, not from recollections of appearance, but from things which Orton had said, and the Chief Justice very properly observed that conclusions of that kind should be left to the jury. Unfortunately, however, a great deal of this unreal evidence was admitted. Twenty members of the Tichborne family, including the Seymours, denied Orton's identity with Reger. including the Seymours, denied Orton's identity with Reger. On the other hand, Reger's mother had professed to recognize him; but it is clear from the Dowager's letters that she had made up her mind to recognize him before she saw him, and in spite of the ridicidens falsehoods in which she had detacted him. Her rawing, prompted partly by a mother's love, partly by jeulousy and, haired of her English relatives, to have a son boade her, to have a son boade her to have the wondered at if Orton imagined, from her readers and predstarmination to adopt him, that a false heir resided answer her purpose rather than none. Of Roger's intimate

personal friends all who were examined, with scarcely an exception, went against Orton. Two officers of the Carabineers

ception, went against Orton. Two officers of the Carabineers recognized Orton with hesitation and a good deal of qualification; but the rest of Roger's brother-officers repudiated him, and the troopers' evidence goes for very little on either side.

Roger's letters supply another test. Orton's handwriting is much worse than Roger's, which indeed is a very fair hand. Roger spelt very well for a French education; Orton's misspellings are frequent and betray the grossest ignorance, and his ideas and style of expression are as different from Roger's as night from day. Roger's letters also show that no intention was more remote from his mind than that of breaking with his family surrendering day. Roger's letters also show that no intention was more remote from his mind than that of breaking with his family, surrendering his fortune, and burying himself out of sight. He was keen about his rights, and fully intended to return and take advantage of them. Perhaps, however, the strongest indication of the falsity of Orton's pretensions was to be found in the bent of his own mind. There is nothing which any one would find it more difficult to realize than that other people should have doubts as to his identity. It would strike him as quite incomprehensible, and it would be in his power to dissipate all doubt by allowing himself to be carefully examined, and by talking freely as to his past life. to be carefully examined, and by talking freely as to his past life. From the first hour Orton took it for granted that people would suspect and repudiate him, shunned Roger's old friends, and avoided conversation with everybody for whom he had not been

previously prepared.

One of the most remarkable, and possibly to some persons puzzling, things about this imposture is that Orton himself took such extremely little trouble to keep it going. He does not seem to have made any serious attempt to pick up a little French, or to imitate Roger's handwriting, or to study cavalry drill, or to get by heart the names of any of the text-books at Stonyhurst, or, in short to establish a resemblance between himself and Roger short, to establish a resemblance between himself and Roger by any means which cost much effort. He did indeed try the handwriting, and it is supposed that at one time he took some lessons in French, but he soon abandoned both as hopeless. He was in Paris with Lady Tichborne for ten days, but he did not think it worth while to make himself acquainted with the houses in which Roger lived as a child. Of the documents provided for cramming purposes he made a very superficial use. It might, perhaps, be thought that this arose from stupidity, but the explanation is partly to be found in his dull, lazy, inert nature, and irreclaimable ignorance. All the hard work of the imposture was left to others, who grubbed up information, looked up witnesses, concooted delusive affidavits, and tried to coach him as well as they could. Orton left himself in their hands, listened short, to establish a resemblance between himself and Roger as well as they could. Orton left himself in their hands, listened as well as they could. Orton left himself in their hands, listened to what was told him, lazily ran his eye over the papers, and recollected only just as much as settled in his mind without requiring any exertion from himself. Dr. Kenealy represented his client as reduced to a sort of idiocy by his excesses, while the Chief Justice spoke of him as "a man of extraordinary intelligence, sagacity, and assurance." That he has assurance is true enough, but his intelligence and sagacity have perhaps been somewhat exaggerated. There can be no doubt that he has a certain quickness of apprehension and native sharpness: but his scintillaquickness of apprehension and native sharpness; but his scintilla-tions of intelligence do not carry him far. They give only a momentary light, like sparks from a flint, and do not enable him to see anything much beyond his nose. There was no foresight or comprehensiveness in his imposture; sufficient for the day were the lies thereof. This may, however, have been partly due to his astounding and hopeless ignorance. He was like a savage tumbling about among all sorts of subjects, without any notion of what they mean. He had no idea, for instance, that Hebrew was not just the same sort of thing as French; and it was this extraordinary ignorance that prevented him from seeing the importance of self-cultivation for the purpose of his imposture. Yet after making every allowance on this score his cleverness does not strike us as very remarkable. Anybody who cares to turn back to Orton's cross-examination will Anybody who cares to turn back to Orton's cross-examination will see that, though he preserved his assurance, he showed little ready wit. When he was hard pushed he simply said, "I really don't remember," or, "I was drunk," or, "I can't account for it," or he pretended to be unwell. Sometimes he tried to parry by a whining complaint that the Solicitor-General was insulting him, and that the questions were impertinent. He was asked, for example, what sort of thing a quadrangle was, and he replied, "What do you mean by what sort of a thing is it! It is very shameful, causing an enormous waste of time. It is He was asked, for example, what sort of thing a quadrangle was, and he replied, "What do you mean by what sort of a thing is it? It is very shameful, causing an enormous waste of time. It is insulting; I won't answer." Another time he says, "I am in a state of confusion. My counsel put the question one way and you put it, another way"; or again, "You are asking me things that I can't remember, and are trying to make me perjure myself. It is very unfair" (Mr. Serjeant Ballantine:—"You had better keep yourself quiet"). "But I will not allow you to try to make me perjure myself," and so on. On one occasion he remarked to Sir J. Coleridge, "I wish you had my brains and I had yours for a little time," but any fool could say that. Orton is not without a certain amount of Cockney impudence and sharpness, but it is idle to say that he showed cleverness because Sir John could get very little out of him; as much might be said of a stone wall if put under examination. The truth is, that Orton's imagination is of that kind which can only invent a broad lie, but cannot supply details, or put together a coherent story. He has no originality or inventiveness. He filled Roger's life with mames and dates taken from his own. He ascribed St. Vitus's Dance to Roger because he had had it himself. He said Roger left England in the Miller, the said Roger left England in the Miller,

captain and sailors of the supposed Copyry after names in the Jessie Miller. He put the names of real people, Orton's friends, into the Wagga-Wagga will, when he might have given the names of non-existent persons, if he could only have thought of any. He said Lady Tichborne was very stout just because hissewn mother was stout. He had to find a name for a horse of Roger's, and he called it Plenipo, because there had been a Plenipo at Johnston's farm. He had had experience of seafaring; yet look at the preposterous absurdity of his story of the shipwreck and alleged rescue. The explanation of the sealed packet is another instance of his mental helplessness; and he was equally incapable of suggesting an intelligible reason why Roger should have given up his family and 20,000% a year for the pleasure of cutting up pigs and handling offal. In fact, the more the case is examined the more amazing does it appear that such a filmsy, transparent, and ignorant imposture should even for a moment have had a chance of making dupes. It is evident that Orton himself did very little to keep it alive, and that he merely allowed himself to be floated onwards on the tide of human credulity and imbecility. It may be supposed that he had confederates in his plote who did much more for it than he did himself; but the accomplices to whom he mainly owed his success were the fools who, in their self-conceit and supposed superiority of discernment, refused to look at plain obvious facts, and would be satisfied with nothing but wild improbabilities and impossibilities. Unfortunately there is no reason to suppose that this sort of fool will soon die out. soon die out.

GRANGES.

NE of the most curious, and to outsiders most unintelligible, phenomena in contemporary America is the extraordinary development of what are called Granges. What is a Grange? is a question to which we have not seen any complete answer. Probably, indeed, a complete answer could hardly be given, because the Granges affect a cortain degree of mystery as to their purposes, and, as is generally true in cases of mystery, are perhaps not very clear about the matter themselves. The manifesto which has been recently published by their governing body informs us that they intend a fundamental reformation of all the evils in the world. So many societies devote themselves to this excellent object that many societies devote themselves to this excellent object that the description can hardly be considered as distinctive. Some features of the movement, however, are sufficiently marked and intelligible. The vast agricultural community of the Western States has naturally been impressed by the immense importance of good communications with the rest of the world. The farmers of hat region can produce corn in indefinite quantities. But man cannot that region can produce corn in indefinite quantities. But man cannot live upon corn alone, and a farmer entirely isolated from the rest of the world must sacrifice a good many of the comforts of life. It is but a small advantage to the Irishman or the German to be transplanted to the most fertile region in the world if he is also put at a distance from all the great commercial and manufacturing centres. The produce which would make him a rich man if it were in the Eastern markets becomes a useless burden to him in the absence of effectual means of transportation. The religious the absence of effectual means of transportation. The railways, therefore, are the arteries upon which the prosperity of the region depends; and the railways appear to have taken full advantage of their position. In America the railway interest is a great political force; and the various maneeuvres by which shares can be converted into influence have been one great cause of corruption. The farmers appear to have suffered under the practical monopoly The farmers appear to have suffered under the practical monopoly enjoyed by some of the great Companies. They could not bring their produce to market or receive goods in exchange without paying tolls which they regarded as excessive. Moreover the railways were in alliance with the existing authorities, and thus there was no chance of getting up a satisfactory competition. The Granges appear to have been originally started as a combination of the farmers against the railways. As they increased in numbers—and it is said that they are now to be reckoned by the thousand—they developed other propensities. They are to some extent co-operative societies, intended to dispense with the services of middlemen. They are more or less social institutions, and no doubt the members of a more or less social institutions, and no doubt the members of a scattered and monotonous society are very glad to catch at any means of amusing themselves—even by listening to lectures. They have, it seems, more or less of an eye to the emancipation of women, though we do not quite see the connexion of ideas; and moreover, they have been suspected of socialist tendencies. One of their chief leaders is reported to have made an ugly remark about the possibility of trees bearing human fruit; and, whatever may be their present intentions, it is obvious that their success in bringing about so widely-appead an organization of the whatever may be their present intentions, it is obvious that their success in bringing about so widely-apread an organization of the chief class in the country, dealing with matters so vitally affecting the interests of society, is a symptom which well deserves the attention of political observers. No one can say to what results it may lead; whether it will really produce any great effect, or simply add one more to the ephemeral associations which have looked very formidable for a time, and sunk to be more tools in the hands of skilful politicians.

Meanwhile the manifesto to which we have referred in a curious

the hands of skilful politicians.

Meanwhile the manifesto to which we have referred is a curious document in its way. If it does not tell us very distinctly what are the plans of the Granges, it may throw some light upon the doctrines which are fermenting throughout the most rapidly developing part of the American population. The "National Grange," indeed, her rather a pronounced tasts for edifying plati-

tudes. Its members declare that they are united, like most other respectable bodies, for the good of themselves, their country, and mankind. Moreover they "endorse the motto," which did not appear to be in much need of endorsement, "In essentials unity, in an ensemtials liberty, in all things charity." What are essentials and what non-essentials? And as for sharify and the in non-essentials liberty, in all things charity." What are essentials, and what non-essentials? And as for charity, even that highest of Christian virtues has a very ambiguous meaning. No-holy wishes to be in charity with oppressors; unless charity includes a state of mind compatible with inflicting all necessary chariteens tupon oppression. The Northern States used to hold that it was charitable to crush their Southern brethren for the good of the negro or of themselves. The South thought that the first precept of charity was that they should be allowed to secode whenever they pleased. Between the two, charity came to involve the killing, wounding, and imprisoning of a considerable fraction of the population. Nobody, again, ever set out with more charitable professions than Robespierre; and his interpretation of the abstract principle in concrete cases led to a good deal of difficulty. We look therefore to the succeeding resolutions to see whether we can obtain any more light. The third resolution gives as a number of excellent moral precepts, which read something whether we can obtain any more light. The third resolution gives as a number of excellent moral precepts, which read something like the answer in the Catechism to the question, What is our duty to our neighbour? supposing it to have been judiciously interspersed by comments upon Adam Smith. The Grangers mean to develop a higher and better manhood and womanhood; to buy less and produce more; to enhance the comfort and attractions of their homes, and to condense the weight of their expectations of their homes, and to condense the weight of their exports; to hasten the good time coming, and to calculate intelligently on probabilities; to secure entire harmony, good will, and vital brotherhood, and to "sell less in the bushel and more on boof and in fleece." Most of these proposals are plainly desirable; but perhaps it would have been shorter to say that they "endorsed" the Sermon on the Mount and Franklin's Poor Richard. Nobody, however, can object to a manifesto stating that those who put it forth mean to act in the spirit of good Christians and sound traders. Occasionally there may be a little difficulty in making the best of both worlds; but the aim is at least judicious, whatever the

obstacles that may present themselves.

In the next resolution we find something rather more definite. The Grangers tell us that they want to get rid of "a surplus of middlemen"; but they add that it is not because they are unfriendly to middlemen, but because they do not want their services. We fear that the purity of their motives will make very little difference to the middlemen. Nobody, as far as we know, objects to shopkeepers in the abstract. If either shops or railways will do anything for us cheaper and better than we can railways will do anything for us cheaper and better than we can do it for ourselves, we must indeed be wantonly malignant to object to their existence. The Grangers, in fact, would evidently be the last people in the world to object to a good system of transportation. It is rather superfluous in them to tell us that they are not the enemies of railways or canals; all that they require is to put down the tendency of corporations "to oppress the people and rob them of their just profits." They do not, however, inform us what are just profits, or where robbery begins and legitimate enterprise ends. We must only take such confort as we can in the assurance that in their "noble order there is no as we can in the assurance that in their "notice order there is no communism and no agrarianism." They do not therefore intend to subvert the social order. Neither, as it appears from their next resolution, are they "a political or party organization." They are content, it seems, with inculcating the principles which lie at the sbottom of all true politics, and the principles which he at the spottom of all true politics, and seeking the greatest good of the greatest number. However, they are careful to add that they do not inculcate indifference to political questions. On the contrary, they think it the duty of every man to influence for good the party to which he belongs, and to put down bribary and corruption. They desire proper equality, protection of the weak, and restraint of the strong. These, they add, are American principles—a statement which we hope is not intended to claim the exclusive property of Americans in such year excellent, but slightly obvious, doctrines. As a farmera' invery excellent, but slightly obvious, doctrines. As a farmers' institution, they go on to say they cannot admit members who are not farmers; but they hope that all good citizens will co-operate with them cordially in removing every vestige of tyranny and corruption. Finally, they intend to help all brethren in want, and to show "a money appreciation of the shilling and subground to show "a proper appreciation of the abilities and sphere of woman." What her abilities and sphere may be they do not precisely say, except that she is qualified for membership of a Grange. And so they pledge themselves to labour "for all future time" for a return to the "wisdom, justice, fraternity, and political

purity of our forefathers."

This last sentence is perhaps rather curious as indicating that in the opinion of a large class of Americans retrogression may be in some cases identical with progress. But otherwise we must admit some cases identical with progress. But otherwise we must admit that, so far as their public programme goes, there seems to be no reason why any human being should not be a member of a Grange. We have seen a good many political professions of faith; but we do not remember ever to have met with any school of thinkers who did not object to corruption, tyranny, and injustice. There is not, if we may trust to their public utterances, any party in any country of the world. Whig or Tory, Republican or Democration are to the world. Whig or Tory, Republican or Democration are to the most elementary laws of morality; though it is unsections are equally conducive to the end which they all have at heart. If the Grangers would condescend to enlighten as particular methods by which they hope to introduce.

the miliennium, we should be able to form some more definite opinion as to their prospects. Meanwhile it is rather hard to forecast the future of a party of which the only very distinctive tenst seems to be the doctrine that railways should not be allowed to enjoy a monopoly inconsistent with the full development of the resources of the country. Was it worth while to get up so resources of the country. Was it worth while to get up so elaborate an organization and put forward so elaborate a manifesto for so small a purpose? If we were more behind the scenes we might be able to discover what is written between the lines. Possibly the Grangers have some definite schemes which they do not think it judicious to reveal to the outside world. Perhaps, in spite of their eloquent appeals to unity, they are so much divided amongst themselves that they cannot trust themselves beyond the limits of safe generalities. But it is also possible, if we may include it is also possible, if we may the limits of safe generalities. But it is also possible, if we may indulge in a conjectural interpretation of their sentiments, that there is really some significance even in the apparent vagueness of their platform. It may be an indication of a change of sentiment not altogether confined to America, and which may be destined to produce important effects in the future. In fact, the sentiment which seems to run through the whole of the production is a general disgust with recent political movements. The Grangers are tired, and not without reason, of the futile contests between parties which have lost their original meanfutile contests between parties which have lost their original meaning. They see that Republicans and Democrats have alike fallen to a great extent under the dominion of "rings," and that the old organizations are much more profitable to the leaders in their ond organizations are much more prontable to the leaders in their private capacity than conducive to the welfare of the public; and they are anxious, though they do not see their way very clearly, to turn legislative power more to purposes of social improvement and away from mere political squabbling. We have certainly no reason to be surprised that great numbers of independent farmers should be disgusted with modern manifestations of American relations and should have a maked to a new course of the all tenth politics, and should have awaked to a new sense of the old truth politics, and should have awaked to a now sense of the old truth that it is a desirable thing to have some honesty and common sense in their rulers. In such a phase of discontent it is natural enough that they should announce some very venerable truisms with what seems rather unnecessary unction. If we could hope that they would carry out their aspirations and inflict any serious wounds upon corruption and tyranny, we must simply wish them all success. But if they are to do anything, they will have to adopt some more definite measures, and we shall then be better able to judge whether these beautiful professions are a more appeal to Buncombe, to be followed by a slipping back into the old to Buncombe, to be followed by a slipping back into the old grooves, or whether the Wester States are likely to hasten the advent of the millennium more decidedly than other people who have started with equally good intentions.

DEATHS AMONG THE CARDINALS.

THE death of two members of the Sacred College has been THE death of two members of the Sacrad Conego has been announced within the last fortnight, while a third—the most widely known of the whole body—Cardinal Antonelli, is said to be seriously ill. On Sunday week died the Jesuit Tarquini, who had enjoyed his dignity of Cardinal Deacon less than two months, and a few days later Barnabo, Cardinal Prefect of the Propaganda, one of the seniors on the list, followed him to the grave. Tarquin one of the seniors on the list, followed him to the grave. Tarquini was one of the new batch of twelve Cardinals added last Ohristmas to the Sacred College, and his appointment was chiefly remarkable from the fact of his being the first Jesuit for more than a century raised to the purple. The Tablet devotes a column to recounting raised to the purple. The Tablet devotes a column to recounting his various virtues and distinctions, but omits what had undoubtedly the most direct bearing on his recent elevation—his connexion with the Civillà Cattolica, the haspired organ of the Papacy. It omits also, while stating that he was "well born," to mention the claim on which the late Cardinal is said to have peculiarly prided himself, and which would certainly, if established, place his ancient lineage far beyond all competition of the bluest of all blue blood of modern Europe. His Eminence, ignorant or contemptuous of the historical heresics of Niebuhr and Cornewall Lewis, traced his descent from the regal line of Tarquin. The Pope is said to have greeted him one morning, on his presenting himself to pay have greeted him one morning, on his presenting himself to pay his respects, with the Horatian salutation Tarquinus atavis edite regibus. But, if his Holiness is correctly reported to have expressed the deepest sorrow on hearing of Tarquini's death, the regret may safely be presumed to have been paid rather to his services as a shrewd and practised adviser and constitute to the literaportors present that to the regret may safely the presumed to have been paid to the literaportors of the constitution of the properties to the literaportors of the lite tributor to the Ultramontane press than to any mythical glories of a remote ancestry. If there be any truth in the rumour, now again renewed, of an approaching creation of fresh Cardinals, it will be curious to observe whether the red Hat vacated by Tarquini is bestowed on another Jesuit. It is against the tradisock, or even accept, ecclesiastical dignities, except under obedience to a positive Papal command. But the Society which has remodelled during the last few years, not only the policy of the Holy See, but the structure of the Creed, can hardly shrink from

ecclesiastical orbit of the Christian system, is still regarded and treated at Rome as a mission—that is, a heathen—country. It remains therefore, after, as before, the establishment of the Catholic hierarchy, or the Papal aggression—whichever description be preferred—subject to the supreme jurisdiction of the College De Propaganda Fide, of which Cardinal Barnaho was the Prefect. But what, it may perhaps be asked, is the Propaganda, and what is meant by its authority in England? We will endeavour to explain. And first as regards the Propaganda. Its origin must be traced to a decree of Gregory XIII. (1572), by which a certain number of Cardinals were charged with the direction of missions to the East, and catechisms were ordered to be printed in various languages for missionary purposes. But nearly half a century clapsed before the present institution was firmly established and provided with an adequate endowment. There was a certain Capuchin preacher at Rome, one Girolamo da Narni, who enjoyed the reputation of a saint, and whose pious eloquence so charmed Bellarmine that he said one of St. Augustine's three wishes had been granted to him—the wish to hear St. Paul. By his advice the Congregation of Propaganda was thoroughly organized, charged with the superintendence of missions in overy part of the world, and directed to assemble at least once a month in the presence of the Pope. Gregory XV., during his short pontificate of two years, became the second and real founder of the institution, for which he also advanced the requisite funds. He had already shown his keen appreciation of the importance of Christian missions, and his conviction, to use Ranko's words, that "the salvation of the world depended on the spread of Catolicism," by canonizing Ignatius Loyola and Francis Xavier, the two men who had done most in those latter days to promote the conversion alike of heretics and heathen. The conspicuous sorvices of Ignatius in the first, and of Xavier in the second field sof labour, are duly recorded in the Bull

they are usually committed, holding the titles of Sees in partibus infidelium, are directly amenable to its jurisdiction. England, therefore, was of course under the Propagunda before 1850; it is not equally easy to explain how it has remained so since. Such, however, is the fact. No doubt it is partly to be accounted for by the growing tendency of the Curin for the last three centuries to concentrate all power in their own hands, and reduce the episco-pate to the condition, at best, of dignified satraps under an autocrat whose will is absolute and supreme whenever he chooses to make it felt. And hence it has become the fashion now with Ultramontane writers always to describe the Church as a pure monarchy, whereas Lacordaire, the "impenitent Liberal," insisted to the last on the old doctrine of her divine constitution including and harmonizing the three typical forms of government, monarchy, aristocracy, and democracy. And the loss of political power by the Church has in one way tended to the same result. The Court of Rome is at least as tenacious of power as in the middle ages, but now that its sentences carry no secular conthe middle ages, but now that its sentences carry no secular consequences, and receive no support from the secular arm, so like-wise they are relieved from all secular control. As a Roman Catholic critic who had himself suffered from the arbitrary inflictions of the Caria has pithily observed, "When it mixes in general society it must be as well behaved as its neighbours, and observe the laws; but it may be as tyrannical as ever in its own household, where the slightest remonstrance on the part of any of its domestic staff would lose them their places." And accordingly the resolution taken at Rome in 15th of that neither bishops, nor the forms of an hierarchy as exhibited in Catholic countries should be permitted in England," was rein Catholic countries should be permitted in England, acided in form rather than in fact by the creation of the hierarchy of 1850, which has been truly enough described as "three parts a sham." It came out not many years ago in a dispute between Archbishop Manning and one of life spiritual subjects, that these prelates have no forum exturnum, or, in other words, no canonical rights and powers, and are as completely under the thumb of Rome as were the Vicars Apostolic who preceded them. Their utter impotence to act for themselves was amusingly exemplified about ten years ago in so simple a matter as the proposed opening of a Roman Oatholic Hall at Oxford, to which Cardinal Wiseman was at the time favourably disposed. A gentleman who had written to one of his suffragans on the subject was told in reply that "it was useless to apply for his sunction without having secured Rome first." A more striking illustration of the absolute subjection of English Roman Catholics to the jurisdiction of the Propaganda, which also serves to illustrate the peculiar characteristics of the late Cardinal Prefect, was supplied two or three years later, just after the death of Cardinal Wissman, by an occurrence of which an authentic record has since appeared in print. At that time a memorial bearing one hundred and seventy signatures of the English Roman Catholic gentry, and known to represent the wishes of a much larger number, was next to Rome, deprecating any interference on the part of the Holy See with the effection of their sons at Oxford. It was Cardinal Bamaho's office to receive it; and as Rome, under the influence of Br. Manning—not yet become Archbishop—was understood to have committed herself to an adverse view of the Oxford schema, it was natural that his Eminence should administer but cold comfort to the deputation. But the line of argument he adopted must certainly have rather startled them. Cardinal Barnaho is said to have been so well posted in English Catholic matters as to have kept in his desk a memorandum of the name and position of svery Roman Catholic priest in England, together with an account of his character and opinions. Whether he was equally well informed as to the social and political condition of the country pieced virtually under his spiritual superintendence may be judged from what took place on the occasion referred to. The Cardinal Prefect, we are told, "objected to the memorial that it had not been signed by a single Prince or Duke, and that the majority of the signaturies-were mere gentlemen." His Eminence was informed that in England there are no princes, except those of the blood royal, who are all Protestants, and only one Catholic Duke, who was then a minor. He next objected to the fewness of the signatures, and, on being reminded that the number of educated Catholics in England was not very large, answered that he knew better. He had lately read a report of Cardinal Wiseman's funeral, describing how the streets and housetops were lined for five miles with millions of admiring spectators. The suggestion that the millions in question, admitting the number to be correctly stated, were neither all Roman Catholics, nor all belonging to the upper classes, was received with evident distrust. But his Eminence classes, was received with evident distrust. But his Eminence classes the matter with a still more conclusive argumentum ad housians which brought the interview to a close. The deputation, he observed, were of course acquainted with the Constitution of their own country, and therefore knew that "in England, when the Quean of the Pope, and

Cardinal Barnabo was a red-tapist of the straitest sort, but he had the reputation of being a thoroughly upright and conscientious man. It may perhaps occur to English Roman Catholics to reflect quantulis sapiential regitur Anglia—meaning of course by Anglia the Anglo-Roman Church—under such a system of administration. And, although it would be possible enough to have a better informed Prefect of Propaganda than Cardinal Barnabo, it would also be very possible for his successor to be narrower, more prejudiced, and less conscientious. It is much as if all colonial bishops tell their dioceses under the absolute control of the Secretary of the S. P. G., and had to present themselves once in every three years at his office to give an account of their stewardship. The Sacred College will not be seriously affected by the loss of Barnabo or Tarquini. It would be a very different matter if the fears entertained for the life of Antonelli, who has already received the last sacraments, were to be realized. Meanwhile the Pope, who has lived to nominate nearly a hundred Cardinals and to witness the death of about half his nominees, sedet extrnumque sedebit, to all appearance, hale and hearty as ever and exulting in the vigour of a youth perpetually renewed. He almost seems to say in the words of the poet, "Men may come and men may go, but I go on for ever"; and it is hardly wonderful perhaps that his most extravagant pretensions should win such unquestioning acceptance, when his faith is so unbounded in himself. It would be rash to hazard any conjecture as to the next occupant of the Papal throne, except that he is pretty sure to be an Italian, and most of the Italian Cardinals are, like the late Prefect of Propaganda, essentially "safe" men. But it is little more than a truism, when we run our eye down the list of names composing the Sacred College as it now exists, to say that not one of its members is likely to equal the influence, the years, so the sublime audacity of Pius the Ninth.

MEDICINE AND SOCIETY.

A DISCOURSE on the relations of medical practitioners with society concerns both doctors and patients, and therefore we have read with interest an Introductory Address delivered at St. Mary's Hospital in October last by Dr. Shephord, and lately printed, which deals chiefly with this subject. The lecturer has our entire sympathy in arguing against a dictum of Addison in the Spectator, that "when a nation abounds in physicians, it grows thin of people." If this were a true saying, the population of England ought to decrease, as there is an increasing tendency to employ doctors, although for the most part in measures of prevention rather than of what used to be called once. "Our says," says the lecturer, "that is our caring; and our care depends upon the lecturer, "that is our caring; and our care depends upon when we are said, but quacks come to us, and it is perhaps natural that impressions which are forced upon us by quacks affect our judgment of the doctors whom they diagrace. There are, for example, the wall-educated specialists who sing their own prises as facility as the herbalist and the bone-cotter. We acquire to manual destroy is not necessary to make it. The lecturer apily describes his brothers as "collecting certainly with patience new facing achieves, in patience are according to the patience was to have discontinued."

church and dismer and to drive especially through mud and wet a small carriage. The advice nowadays would be to write a book. The lecturer thinks that, if doctors "read a little more and wrote a little less," their knewledge would be more thorough. This advice need not be confined to doctors. We have used the general term "quackery" to include not only the advertising pill-mongers, but also that which the lecturer calls "the worst form of quackery, dutwardly fair, which, like the killing ivy, still clings to the profession." Indeed, it would be strange if there were not quacks as long as the public is ready to believe in them.

The world is naturally averse To all the truth it sees or hears, But swallows nonsense and a lye With greediness and gluttony.

In the days when the Spectator wrote, "Had all these advertisers arrived at the skill they pretend to, they would have had no need to publish to the world for so many years successively the virtues of their medicines," the value of a name was not fully understood. Now it is necessary not only to advertise in order to get a name, but to advertise more plentifully to keep it. The most pertinacious advertisers of the day are the dealers in pills, wine, and tea, which may all be classed under the general name of chemicals. We hear so much now of adulteration that it is seriously questionable whether one form of British liberty may not be before many years abridged. The right to make and vend pills and potions of which nobody except the vendor knows certainly the components, is much more clearly profitable to the vendor than to anybody else. The world could perhaps go on without Merison's

pills, but perhaps Morison could not.

These remarks may be illustrated by a case, at once grotesque and melancholy, which is reported from the assizes. A man called by himself a "professor," by his counsel a "quack doctor," and in the gaot calendar a "herbalist," has been tried for causing a patient's death by pills containing arsenic. He was found grafty of manslaughter, but recommended to mercy by the jury "because we do not think he knew the excess" in the quantity of assenic. He had been saling the pills for two years without being aware of their dangerous character, and if he only killed one person in that time, the neighbourhood in which he practised has had a fortunate escape. He has only been sent to prison for three months, and it may be hoped that people will be able to die without his assistance until he is again at liberty. Our law is lemient to the mistakes of doctors, qualified or unqualified. A judge has said that in remote parts of the country many persons would be left to die if irregular doctors were not allowed to practise; and we might add that some persons would be left to live. In the case of St. John Long it was proposed to call patients whom he had cured, to which it was objected by the other side that they could not call the patients whom he had killed. He rubbed the back of a young woman with a lotion of such strength that it killed her, but nevertheless a witness was produced who "never ceased to pray for Mr. Long." A woman was tried for killing a child by applying a corrosive plaister to its head, and many witnesses declared that she had cured them of diseases when regular practitioners had failed. Sometimes, after a quack has done mischief, a regular doctor is called in to try to remedy it, and if the patient dies, of course the quack alleges that the regular doctor killed him. In one case there was the further complication that a neighbour had recommended "nerve powder" to the deceased. Thus one regular and two irregular practitioners performed a kind of triangular duel over the corpse. A man had been told by the surge

Nevertheless, both in its physical and its moral aspects a nation ought to be bettered by the existence in it of a well-educated body of medical men. Samitary reformers aim at cleanliness, which is next to godiness. The activity of medical practitioners in sanitary reform is one of the best features of our time. In this department there is little room for quackery, and even if activity be inspired by the desire to become known, it is not on that account less useful. It must not be supposed, however, that the theory of sanitary reform is now, although to a great extent the practice is. Caius, in his "Bolas against the Sweating Sicknesse," quoted in Dr. Corfield's Ordination of Senage, says, "Take away the causes we may, in damnying diches, letting in open air, burieng dede bodyes, kepyng canalles cleane, sinks and easyng places aweet," the These principles were laid down, but nobedy paid at tention to them. Probably the evil consequences were less felt when the country was sparsely populated, and certainly they were less regarded. Our generation is perhaps undaly devoted to statistics, but still it must be owned that human his and death are weatched among us with an intalligent solicitude almost unlianway to other ages and countries of the world. Without suggesting that we hear at all two much about sewage pollution and smillar unpleasant subjects, it may still be said that we hear a very great deal. In all parts of Engiand the same process means to be going on. We see, in a new and disagreeable sense, this heirs of all the ages. The accumulated filth of means the countries of the world. Without suggesting that we hear a wery great deal. In all parts of Engiand the same process.

to endure, and it is even proposed to relieve earth of a task too heavy for it by burning instead of burying dead bodies. The accumulation of population in great towns is not likely to be seen arrested. Vainly the traveller describes the lovely chimate and exuberant fertility of America or Africa. Millions of our countrymen must either live as they have lived or stave, and hence the problem of living healthily in dense masses engages more and more the attention of social and sanitary reformers. Parliament has shown its sense of the emergency by passing a number of confused and contradictory enactments. The lawyer is often, and sometimes in vain, invoked to say what can be done; but the doctor can generally say pretty clearly what should be done. Sickness is a chief cause of non-payment of runt, and therefore all owners of house property ought to be sanitary reformers. But the prudence which spends a shilling to save a pound is rare among us. Our upper and middle classes were till lately educated in utter ignorance of chemistry and all cognate sciences, and if anything was wrong with air or water, the ordinary householder was no more capable. of explaining it than mediaval citizens who prescribed the Jews when the plague broke out among them. Much must still be done to enlighten the public mind on these matters, and the doctors, who are everywhere at all times and seasons, have the best means of doing it. "Our science," says the lecturer, "ought to come home to the people." The great aim of the medical profession for ages has been to diminish disease, especially to guard against those epidemic diseases by which the mortality of all countries is swelled encormonaly. The representatives of this profession, like the Jewish lawgiver, have preached cleanliness as the great preventive of disease, and isolation when disease has broken out. But they have gone beyond him in giving reasons why this or that should be done or avoided. This has been rendered necessary by advancing education. Formerly when pestilence broke ou

The locturer does not think that women can to any great extent succeed as medical practitioners. But, believing this to be a matternot of opinion but of fact, to be settled only by experience, he urges that the experiment be tried quietly, fairly, and completely. We may venture to remark that even the women who fail as doctors may succeed as nurses, nor is it easy to be persuaded that any knowledge, however small, of medicine or surgery, provided it be sound as far as it goes, is not better than none at all. Livingstone, in order to qualify himself for missionary enterprise, obtained a medical education, and much of his influence among the African races was doubtless due to the cures he performed among them. A doctor who travels is at least able to prescribe for himself; and indeed we read that Mr. Stanley, who was not a doctor, prescribed for himself and all his party while he was seeking Livingstone. A doctor's practised habit of observation makes him a useful traveller, and a woman who tried to become a doctor would acquire habits and knowledge which would certainly useful whether she travelled or stayed at home. It is a pity a movement in itself landable should have been both communiced and resisted with unnecessary excitement. The claim of the lady students of anatomy to be taught in mixed classes was the "advanced" for ordinary comprehension, and it brought ridicule as well as distrust on an experiment which deserved to be fairly tried. An intelligent woman who has studied medicine must be more useful than a male quack, but countless persons of both seases would prefer the quack. "It must be confessed," says an old writer, "that the depths and secrets of this most excellent art of physic are far beyond the reach of the most skilful woman." We incline to adopt this opinion, but we hold with the beturer that, if we are right, experience will confirm our view." It would at any rate be well that women equally with men should be instructed in sanitary matters, so that in time the care of the public health may cease to be impeded by dense ignorance or narrow prejudice. It is difficult to believe that thorough knowledge of any subject or art of a subject can injure either man or woman. It is difficult to believe that the heads of a profession remarkable for liberality of thought and action would refuse to impart knowledge to man or woman who seriously desired to attain it. of quackery in England is a portentous fact which can only be accounted for on the supposition that neither men nor women in general know anything at all of the subject, of which the quack knows just enough to utter a few big words. We were about to We were about to institute a comparison of the advantage of teaching women medicine and cookery, but really these two branches of latowledge grow from the same stem. The readiest check on that adulteration of food of which we hear so much would be that the mistress of every homsehold should be able to test readily the quality of articles supplied to it. When ladies are eduthe quality of articles supplied to it. When ladies are educated to that point, it will be unsafe for the family doctor, if he cannot cure an illness, to hide his ignorance by giving it a Latin or Greek name. At present we like to fear the material body discussed almost in the style which the Daily Telegraph applies to the body politic. The spread of good sound education among doctors and patients would go far to extinguish quackery; among doctors and persons would go let to extinguish quarter, and this lecture may do good by exhorting students to aim at a high standard of knowledge, and not be latily content with answering the needs of an examination. The general practitioner is the advance-guard of the army which fights against disease. His opportunity of learning is short and fleeting, and then he is entrusted with the lives of individuals, the happiness of families.

the safety of a community. Notwithstanding the high authority of Addison, we doubt whether a nation can have too many doctors, provided they be good ones.

THE TIMES ON SCANDINAVIAN LITERATURE.

THE TIMES ON SCANDINAVIAN LITERATURE.

THAT the Times or any other paper should review the Icelandic and English Dictionary which has just issued from the Clarendon Press is right and proper. That the critic who reviews it should do full justice to the labours of the three persons who have had a share in the work, Mr. Cleasby, Mr. Vigfusson, and Dr. Dasent, is also right and proper. That he should take the opportunity to set forth the importance of the Scandinavian languages and literature, and the claims which they have on the study of Englishmen, is right and proper no less. That, in so doing, one who is evidently a special lover of Scandinavia as against the rest of the world should a little overdo matters and claim for his favourite Northmen rather more than is strictly due to them, is, if not right and proper, at least natural and pardonable. That a special partisan of Northmen should pick up somewhat of the Berserker rage, and of Northmen should pick up somewhat of the Berserker rage, and should rush on through his article like a stream that has just swept away its dam, is, if not natural and pardonable, at least what we are away its dam, is, if not natural and pardonable, at least what we are thoroughly used to. That a student or critic of Dr. Dasent should pick up somewhat of Dr. Dasent's manner, that he should take the opportunity of reviewing an Icelandic Dictionary to make small jokes about the "Sarcophagus Club," and "our wife," and cabman who is to take him to Belgrave Square, and about Mr. Gladstone's dissolution of Parliament, is perhaps not wholly unparalleled. But what does seem to us uncalled-for (we bow to Dr. Dasent's critic; we cannot say "unclept for"), what we take (we again knock under; we cannot "nim") the liberty to think is going rather beyond the mark, is when the critic, not content with exalting the Old-Norsk tongue, makes an onslaught against the Old-English tongue; when, not content with paying a well-deserved homage to Mr. Vigfusson, Dr. Dasent, and their fellows, he must needs deal a stray stroke of the Danish axe against certain English scholars who really have nothing to do against certain English scholars who really have nothing to do with the matter.

There is something amusing in the way in which the critic's zeal boils over at the very mention of an Icelandic-English Dictionary, and in the astounding waste of energy with which he lays about him to prove many things which are true but not new, and a few which, whether new or not, are certainly not true. Here the burst begins in italics:—

An Icelandic-English Dictionary. In these days of universal enlightenment, we wonder if any one doubts the importance of such a work, and whether it can be necessary to prove the fact.

We wonder too, or rather we do not wonder, or rather perhaps we wonder that the Times' critic should take the trouble to wonder about it. We can only speak for ourselves; but, without pretending to universal enlightenment, we at least feel ourselves so far en-lightened that we have no doubt whatever as to the importance of lightened that we have no doubt whatever as to the importance of the Icelandic-English Dictionary, and we should have thought it quite unnecessary to prove its importance. Then the critic goes on to tell us of a number of things which "every child knows of course," and about some of which we should be very glad if every child did know them. We beg however to make an exception on one point. We hope that no child believes that the "Northmen, that aggressive race, from the base of their possessions beyond the Humber, pressed the Saxon population before them in the great district of Mercia." The Saxon population of Mercia was just what the Danes left alone, when, in 877, "gefor se here on Myrcena land, and hit gedældon sum and sum Ceolwulfe sealdon." In the division between Alfred and Guthrum all the Saxon part of In the division between Alfred and Guthrum all the Saxon part of Mercia was carefully secured to Alfred.

From the child the critic appeals to the grown man, and that in one of the grandest efforts of the grand style. The preamble somewhat reminds us of the preamble of ancient Acts of Parliament in the days when there was such a thing as legislative eloquence:

the days when there was such a thing as legislative eloquence:—

Now, lest grown men should affect to despise, as altogether antiquated and obsolete, all this information which every child knows, relegating it at once like Milton—who knew nearly as little of the subject as most of our grown men—to the days of bows and arrows, and comparing the mighty struggle by which all England was lost or won to, "the flockings of kites and crows," we proceed to remind the grown man flat he, too, has a native language, and affects to speak it with all that elegance and purity which so invariably distinguish the grown man of the present day. He would be the first to confess, however little he may be concerned with Canute and Edmund Ironside, and however much he may despise utterances such as that of Harold the Saxon to his Norwegian namesake, when he offered him seven feet or a little more as his share of English earth, or deeds such as that of the nameless Norwegian who, after the battle of Stamford Bridge, held the bridge over the Derwent against the whole Saxon host—that even he cannot pass his life without speaking a language largely recruited from the speech of these very Northmen, now dead and gone for nine conturies.

Among so many, parentheses and illustrations we get a little

Among so many parentheses and illustrations we get a little puzzled about the nominative case, the "he" and the "even he"; and people who write with such a mighty rush as this are not likely to stop and remember that, according to history, it was not at the end of the battle, but near the beginning, that the one Northman kept the bridge. Nor are they likely to stop and think that it is rather a slander on the Yorkshiremen, some of whom surely joined the King when he came to help them, to speak of the English host as wholly Saxon. All this is a kind of thing which we must put up with. But we have not yet done with the grown man; he has a most solemn piece of advice given him:—

If our grown man should assert that in this respect he is quite independent

If our grown man should assert that in this respect he is quite independent

of the North, and can get on very well with the words which his Anglo-Saxon forefathers have bequeathed to him, we advise him to try the point in the case of two words which he uses about a hundred times a day,

Then comes the joking in which the critic takes occasion to talk familiarly about Belgrave Square, and to let us see what fashiousable company critics of Icelandic Dictionaries are used to. And there is something more of Icelandic Dictionaries are used to. And there is something more has eased somebody of his pocket-handkerchief, which makes us inclined to me to any new or habel of Angles. "street Arab" who has eased somebody of his pocket-handkerchief, which makes us inclined to get angry, not on behalf of Angle-Saxons or Northmen, or anybody of that kind, but of the misused Semitic folk, who after all are human creatures and speak an inflexional language. The upshot of all this merriment is to show that several Scaudinavian words made their way into English and actually displaced earlier English words. One of these is a very common word take, with its endless variety of meanings. The writer has also to show that in two or three cases of very common words the Scandinavian form has displaced the English. Now really all this did not need such an amazing flourish of trumpets. Granting all the critic's assertions, and we might be inclined to dispute one or two of them, they only prove what nobody ever doubted, that there is a certain Scandinavian element in our language. For our part what we wonder at is that the Scandinavian influence was not much greater than it was. Then comes another burst. After some more talk about kites and crows, the critic goes on to complain of our existing Old-English Dictionaries. We confess with shame, that Englishmen have not done so much with their own tongue as they ought to have done, and that Danes and High Germans, have done more for us than we have done for ourselves. Still surely some good work is doing by several scholars, whose merits it might have been greenful to asknowledge, and at any rate there surely some good work is doing by several scholars, whose merits it might have been graceful to acknowledge, and, at any rate, there was no need for the critic to go out of his way to have a fling at several people some centuries apart from one another who have absolutely no part or lot in the matter:-

absolutely no part or lot in the matter:—

Were we in possession of as good an Anglo-Saxon Dictionary as this. Icelandic-English one, and were thus in a position to know what the Anglo-Saxon language in its purity really was, the proofs of this influence would be still more striking; but, as it is, our Anglo-Saxon dictionaries merely repeat the errors of former compilers, whose ignorance was, perhaps, excusable, but still was ignorance all the same. A scholar like Junius, in the scantiness of the means at his command, might well make mistakes in his Anglo-Saxon Gibasary; but it is too bad to find the same errors handed down for centuries merely because they appear in Junius, though they are manifest misreadings and mistakes. Junius, for instance, might have been justified in confounding many Northern words which the Saxons had adopted from their Northern conquerors with their Anglo-Saxon equivalents, and later on in confounding semi-Saxon, or Early-English distortions, with pure-Anglo-Saxon speech; he might make "coveraldor" into "potwalloper" with the Anglo-Norman scribes, or, in the contemporary life of Edward the Confessor, read "busam vetitum" for "Vusam vetitam," mistaking the Anglo-Saxon "b" and "v" from their similarity in form. Whether he would have translated like Mr. Luard, whom Mr. Freeman has blindly followed, "busam vetitum," by "the buss or ship hindered from sailing," when the writer, alluding to the Ouse choked with bodies, simply said it was forbidden to flow by the curpses of the slain, is more than we can tell; but had he lived in these days he would certainly not have perpotrated his errors as has been the case with those who have merely followed in his wake.

Now we really do not know what all this is about, or what it has

Now we really do not know what all this is about, or what it has Now we really do not know what all this is about, or what it has to do with the labours of Mr. Cleasby, Mr. Vigfusson, and Dr. Dasent. We do not profess to know what Junius, or anybody else, would have done under certain circumstances in which he was not placed, and, as neither the "Anglo-Norman scribes" nor Mr. Luard nor Mr. Freeman undertook to write dictionaries, we do not see how they can be compared with Junius for better or for worse. But if it were worth while to ask a philo-Scandinavian critic in the full rush of the Berserker fury to stop about anything, we might ask him at least to stop long enough to quote accurately worse. But if it were worth white to ask a philo-Scandinavian critic in the full rush of the Berserker fury to stop about anything, we might ask him at least to stop long enough to quote accurately those whom he goes quite out of his way to quote at all. Mr. Luard does not translate "busam vetitum" by "the bus or ship hindered from sailing," nor does Mr. Freeman blindly follow Mr. Luard. If the critic had stopped to look at the passage in the edition of Mr. Luard's Life of Edward, and at Mr. Freeman's Appendix to his third volume, he would have seen that, rightly or wrongly, Mr. Luard and Mr. Freeman explain the passage in two different ways, and that the "buss" belongs wholly to Mr. Freeman and not at all, as the critic says, to Mr. Luard. Mr. Freeman no doubt simply made the best he could of his printed book. Critics who go to the Sarcophagus Club and tell their cabs to take them to Belgrave Square may perhaps be able never to quote any book of which they cannot at once turn to the manuscript. But scholars of a less lordly degree have, since the days of Gutenberg, been commonly glad to use the best—in this case the only—printed text that they can get. The real charge, so far as there is any, is against Mr. Luard. If the critic would come down from his stilts, and would tell us in plain words what he means, it would noor likely turn out that he means that Mr. Luard Mr. Tarard her from his stilts, and would tell us in plain words what he means, would most likely turn out that he means that Mr. Luard has misread his manuscript and has printed "busam" where he ought to have printed "Vusam." We understand him to mean that Vusa means the Ouse, and that the meaning of the passage is that the river was choked up by the dead bodies, which of course, as-far as the fact or fiction goes, is the same thing as the boats not being able to sail for the dead bodies. Now if the critic has any real ground for charging Mr. Luard with this mistake, if he has-himself consulted the manuscript and finds that it is so, he should bring his accusation in a straightforward shape and should show us his proofs; he ought not to throw the charge in at random when he is talking about something quite different. Till he does this was must make two provisional remarks. In the specimen of the manuscript given by Mr. Luard, the v and the b are not at all alike. And in the only text—a mere printed text—of the Helmskringle to

risish we can refer at this west. "Use," and in Figure 1: head on the biographer of he Oute" as if he had been he critic brings against Mr. this moment, the Oune is not called "Vues," counse it is not "Vues," but "Ues," Also, it show of Edward to talk of him as "alluding to d been a penny-a-liner. The charge which

is head on the reogrepher of souward to talk of him as "alluding to the Ouse" as if he had been a penny-s-liner. The charge which the critic brings against Mr. Leard may be perfectly true; all that was my if, that this is not the place or the way to make it.

Learly, the critic cannot wind up without having a fling at the Old-English language itself. He quotes Dr. Dasent's panegyric on Scandinavian literature, against which we have not a word to say, but he must needs bring it in with a little depreciation of our corn andent literature:—

A language may be rich in forms and phrases, in law terms and quibbles, and in allusions and references to folk-lore, and yet not be of much interest to the general reader. The Anglo-Saxon itself is such a language, rich in words and forms, but so poor in literature as not to hold out any inducement to the general reader to study it. When you have reckoned up a few poems and a store of legenda-and homilies, what remains of Anglo-Saxon literature except the Chronicle, a unique and venerable monument indeed, but most tantalizing from its brevity and dryness. Of quite another character is the Legishadic or Northern language, to which the English student has now access through this Dictionary.

We have read something of this kind before from the American writer Mr. Marsh, and it made us ask, as we ask again of our present critic, Has either of them read the book of which he is talking? The English Chronicles differ widely in different parts. The dryness, the brevity, we are ready to say the meagreness, of some parts stands out in the most marked contrast to the fulness and eloquence of other parts. One would think that both Mr. Marsh and the Times' critic can have done no more than turn over a few pages, and that they alighted on these pages at an unlucky a few pages, and that they slighted on these pages at an unlucky point. One cannot think that they can have read the reign of Alfred point. One cannot think that they can have read the reign of Alfred or the reign of Henry the First, the portrait of the Conqueror or the pictures of England during the wars of Stephen. If they look upon those passages as tantalizing from their brevity and dryness, they must use words in some sense which we do not understand. But it is not fair to compare our Chronicles, which are history, with the Sagas, which are legend. Any one who has tried to patch togother English and Scandinavian history would be delighted to have on the Scandinavian side something, be it as dry and as brief as the reign of Onut in the Chronicle, which would give him trustworthy facts and dates. It is rather an odd, standard to take when the critic speaks of "Anglo-Saxon" as being a language which does not "hold out any inducement to the general reader to stady it." We do not believe that the "general reader" is so great a fool as his friends sometimes make out; still we should hardly choose him as do not believe that the "general reader" is so great a fool as his friends sometimes make out; still we should hardly choose him as our guide in questions of ancient literature. We should not have suspected the "general reader" of being much given to the study either of Old-English or of Old-Norsk; still, of the two, one might have thought that the fact that one is his own language, while the other is only the language of his cousins, might make some difference. And, after all, many books written for the general reader, histories of the popular kind, draw on one store as much as on the other. The general reader, the critic's child or his grown man, have each of them a fair chance of having heard of the offer of seven feet of ground made by one Harold to heard of the offer of seven feet of ground made by one Harold to the other; but they have surely at least as good a chance of knowing how "stark" the Conqueror was, and how men in the days of Stephen "tholed" nineteen winters for their sins.

We have only to say that, when the long-expected day comes when Dr. Dasent shall give us the edition of the Sugas for which we have looked in vain for so many years, we shall be delighted to read the panegyric—high-flown perhaps, but we feel sure thoroughly deserved—which his book can hardly fail to win from the hands of

his present critic.

A PARIS MOB.

THOSE who chanced to be in Paris about this time three years ago will scarcely have carried away agreeable recollections of the disposition of the Parisian populace. It was immediately after the German siege, and a week or two before the outbreak of the Communo. The city had been occupied and laid under contribution, and the people were smarting under a humiliation which they had done very little to avert. They had imported into a feverish time and the people were smarting under a humiliation which they had done very little to avert. They had imported into a feverish time of peace the swaggering manners which they had put on with a state of siege, as they retained the arms they had carried as National Guards. They had got into a habit of "demonstrating." They crowded the cases and the wine shops, while their excitable brains and the latent ferocity of their natures were warmed by wine and vitriolized cognac into a highly inflammable condition. The air was charged with suspicion, and, having just been sent under the Caudine Forks, they were eager to vent their feelings of outraged patriotism by the sacrifice of any scapegoat they might catch hold of. We know that there were Germans bold enough to venture back to Paris in those dangerous days; but they trusted to their familiarity with French speech, well understanding that, in the event of detection, their lives would not be worth a moment's purchase. Even Englishmen were very far from safe among a people not much given to discriminating among foreigners; and we have ourselves had the "shibboleth" put to us on board a river steamer, in the shape of a conversation deliberately forced on us with the idea of eliciting proof as to our nationality. Nor was it altogether an agreeable ordeal to go through, while the improvised arccuring for the plebs was backed up by a volunteer tribunel ready to condition and execute at an instant's notice. But more offen-

sive even than the detected Prunians to the mob of Parls were
the man who had acted as police agents under the former "defined,
nor was it admitted as an extension circumstance that they had
renewed their engagements under the existing authorities. Enowing the strength of the general feeling, these gentlemen generally
went about their duties in so strict a secrecy that for the time
being the police might be said to have suppressed itself. If only
one or two of them came to an untimely end, it was because they
took very good care to keep out of the way. One tragedy occurred
to justify their prudence, and it naturally created a profound sense
tion at the time. A cartain Vincentain was murdered under circumstances of the most brutal and sowardly barbarity, and the
trial of two of his murderers has just ended in their condemnation
to death by sentence of court-martial. In the February of 1871 to death by sentence of court-martial. In the February of 1871 some of the troublesome battalions of Belleville had arranged for a boisterous demonstration on the Place of the Battille. The Prefect of Police desired to have information about them, and the unfor-tunate Vincenzini was sent out to observe. Judging by the courage which he showed in his extremity, it is probable that he volunteered for the dangerous service. Unfortunately for himself he was recognized, and the people threw themselves upon him like so many wild beasts to the cry of "Mouchard!" It must be so many wild beasts to the cry of "Mouchard!" It must be remembered that the gathering was ostensibly one of the National Guards, and that there were several disciplined battalions on the spot, wearing the national uniform, and under the command of officers who might be supposed to be men of some character and position, however advanced might be their political ideas. Yet none of these civilian soldiers interposed in any way; or rather they interposed to hound on the assailants of a man who was only discharging his duty and obeying the order of his superiors. He was surrounded by a mixed mob in blouses, broadcloth, and uniform, each of them eager for the infamy of laying hands upon him. The scene that ensued was never surpassed in the most hideous days of the Reign of Terror, and we have no desire most hideous days of the Reign of Terror, and we have no desire to dwell on the revolting details. What we do remark upon is the deliberation with which the crime was perpetrated, and the fast that some twenty thousand persons are estimated to have been factor or less directly implicated in it, thanks to the victim's extraordinary, tenacity of life. Shockingly mangled at the base of the Column of July, he was dragged away in the direction of the Seins. At they passed a grating that covers a subterranean canal the hunderous procession came to a stop while an attempt was inside to force the fastenings. Foiled in that, they resumed their progress towards the river. More than once, strange to relate, Vincensini had the strength to break away from his tormentors, and more than once the resolute interference of the better-disposed bystanders might possibly have saved him. But no one raised a finger to protect him. He was flung at last into the river, and although he had still the courage to try to save himself by swimming he was not allowed even that poor chance for his life. He was pelited to death with any missiles that came to hand, and among the worst features of the whole infamous affair was the behaviour of the crew and passengers on a river steamer that chanced to come up at the time. They at least may be presumed to have been "respectable"; they were not intoxicated by malignant passion, and they did so far obey a natural impulse of lammanity as to make a faint attempt to save the man. But the fear of a bruise or two from the missiles that were flying about was sufficient to deter them; they slunk away, and saw Vincenzini brained with a boat-hook.

The counsel for one of the ruffians on trial had very little to The counsel for one of the running on that has searcely more a urge in favour of his client, except that he was scarcely more thousand fellow-citizens. There to be blamed than his twenty thousand fellow-citizens. There we thoroughly go along with the learned gentleman, We consider that the circumstances of Vincenzini's murder supply painfully that the circumstances of Vincenzini's murder supply painting significant commentary on the recent history of the capital of France. One cannot but be reminded of Voltaire's celebrated definition of the nature of his countrymen. So long as the governing power can keep a firm hand on them, the baser sort show the monkey side of their character. They jabber in chorus to the chatter of empty-pated demagogues, and play as many mischievous and malicious triks as they can with impunity. But when they have broken loose from restraint the tiger comes out, and were to the unlucky victims who fall under their teeth and when they have broken loose from restraint the tiger comes out, and woe to the unlucky victims who fall under their teeth and claws. Their sanguinary instincts flash out with surprising suddenness, as when they began their émeuts on Montmartre by shooting the generals in the Rue des Rosiers; and when once they have seen and tasted blood, they shed it without skint until they are forced back into their dens. We are not inclined to draw over-nice distinctions between the French and the English rough. We believe the one to be about as brutal at bottom as the other. But there is this very practical difference between the two nations, that the English ruffian has seldom a fair opportunity of showing himself in his true colours. A comparatively innocent Chartist demonstration in London is a challenge to which prop and respectability respond by mustering generally as constables for the occasion. With us there are men of all classes, from the peer to the workman, who think public order worth risking their bones for, and if order were once seriously threatened society would find stalwart champions in abundance. In France and Paris is it of the price of ligance the decrease clearly articles. it is otherwise. In times of license the dangerous classes give the tone to popular sentiment and terrorize their betters, whom they push to the wall. The "bandits," to borrow a favourite they push to the wall. The "bandits," to borrow a favourite spities from the French criminal romances, meet the discontented workman on a common ground, gather in the same halls below the same iribunes, and swarm on the same benches in

the same wine-shops. The most strocious doctrines are admitted as matter for fair discussion, the most bloodthirsty language passes current, and caste antipathy under the name of patriotism is considered sufficient excuse for the most revolting cruelty. The actors in a revolution or an emaste, encouraged by a variety of precedents, have a reasonable faith that they will triumph for the time, and rush unhesitatingly into deeds of violence with no wholesome foar of rotribution. The worst excesses are prompted by habitual criminals, and it is those who are reckless and beyond the pale of the law that in reality govern the proceedings of the mob. Meanwhile the cowardly abstention of the more respectable classes makes them accomplices in excesses which at first alarmed them. There is no kind of organization to counteract the impulses that hurry the masses to mischief. No man dare put himself forward in the cause of order, for fear of precipitating his fate and being made an example of. We have said that twenty thousand people were looking on while Vincenzini was dragged along decent streets. A week or two afterwards the bourgeoisis of the boulevards and the Marais remained equally supine while the savage gentlemen of the Commune made their first timid descent. Strangers who were there and saw the apacious thoroughfares know how very little it would have needed to check them in the outset. As no one, however, took it upon him to interfere, Paris was handed over to the anarchists.

It is probable that the villains who have been condemned will be shot, as a this case there is no jury with its stereotyped recommendation to mercy. But we cannot exactly concur in the assertion of their counsel that they are the only persons who are punished. They are singled out, it is true, to pay the penalty of death, because Justice happened to lay her hands on them, but their accomplices, active and presive, have all been suffering as well. Broadly speaking, it may be said that retribution has been meted out with some approach to equality, according to the various degrees of guit of those who have been chiefly responsible for the calamities of the war and the Commune. It is not only that Imperialist generals and statesmen have lost their places, their reputation, or their fortunes, and that the Communist ringleaders, who were not shot down are pining for the most part in New Quedonia. Paris itself is changed altogether from the gay offer that clamourod so vociferously for the march on Barlin, and all classes of her inhabitants are more or less suffering. The rank and file of the Commune, and those who sympathized with their Socialist ideas, are on short commons, if not in actual starvation. The winter has been by no means severe, yet it has been found successary to open soup-latchens, and the press, without distinction of polities, has declared the extreme urgency of relief. Those who apply for tickets and fall into queues outside the littles of doors are the wives of workmen who were earning ample wages but a few years ago. Distress among the artiscans implies general slackness in trade; and, in fact, the shopk epers have log-like prolotariat ruin their native customers and frighten away their feshion of the day, in place of the lavish prodigality of the Empire. The cost of living has gone up with the octroi duties and the taxes; the only thing that has gone up with the octroi duties and the taxes in process of "their general for the benefit of the Circes of the demi monds; the receptions of the Septenna

INTIMIDATION BY PRAYER.

If was at first difficult to know whether the reports in the American newspapers of an extraordinary agitation which was represented to have lately broken out in that country were meant in jest or earnest; but it can now hardly be doubted that they rest on some foundation of fact. It appears that American women, without waiting for the franchise, have taken a short cut to the enforcement of a measure upon which they have set their hearts. They have resolved to put down drinking-bars, and over the greater part of Ohio, and also in some of the other States, they seem to have succeeded for the moment in a remarkable manner. The movement began in Ohiosabout the beginning of the year. In little more than a mouth twenty-five or thirty counties in this State were overrun, and the campaign is now

being vigorously pushed in Indiana and Illinois. The war is carried being vigorously pushed in Indiana and Illinois. The war is carried on by the women of a town or village marching down upon one whisky-shop after another, and summoning each dealer in succession to abandon his trade, and to throw his liquors into the gutter. If he hesitates, he is assailed with volleys of prayer and a cannonade of hymns. If he continues obdurate, a permanent camp is established either in his shop or in front of the door; successive bands relieve each other, and the state of siege is maintained by perpetual singing and praying. With a body of this kind either in actual occupation or planted at the door of taverns, it may be conceived that the regular frequenters are not very likely to find themselves at home there. Any one who attempts to make his way to the bar is liable to be pounced upon and argued with in a vehethemselves at home there. Any one who attempts to make his way to the bar is liable to be pounced upon and argued with in a vehement manner. The names of the regular frequenters are taken down and published in the newspapers, and the offenders are also publicly prayed for in terms which it is somewhat difficult for them to endure. How far there has been any softening of heart on the part of the whisky-sellers or their customers may perhaps be doubted; but it seems to be beyond question that they have found it difficult to resist the agitation directed against them. It is easy to understand that the mobbing by itself, apart from the hymns and the praying, would be sufficient to bring the trade to a standstill; and publicans whose customers have been driven away may reasonably consent to close their promises. One desperate may reasonably consent to close their promises. One desperate saloon-keeper defied the saints, and swore that he would keep open house as long as he had a pint of rum left; but the besiegers resolved to "pray him out," and they did so in such an effectual manner that they not only persuaded him to abandon his wicked calling, but converted him into one of their most enthusiastic allies. As he sends round the hat at all his meetings, his converted him into one of their most enthusiastic allies. version has possibly been a commercial success. A large number of saloon-keepers are said to have surrendered at discretion, and in most of the villages of Ohio the sale of intoxicating drinks has been entirely suppressed. "Athens," says one of the Correspondents of the New York Times, "is the town from which I telegraphed that all the dealers had hardened their hearts, and declared that they would never relent. And now comes the intelligence that they would never relent. And now comes the intelligence that they are eating their words, have had a meeting, and are rapidly making concessions to those daily offering prayers." In Logan, though all the saloons are closed, the fluor-dealers refuse to sign the pledge, and the women have therefore organized themselves into regular patrols to witch for interlopers who may attempt to revive the traffic. In another despatch we read that "the Ripley ladies to-day left their regular field and went over inter-Logan's Gap, a very thriving town, and completely prayed out a laking and gambling establishment." In Ripley it is stated that there are only two saloons that have not succumbed, and these are doing nothing and establishment." In Tapley it is stated that there are only two saloons that have not succumbed, and these are doing nothing and are evidently on the verze of surrender. "Drinkers," however, "hope for a reaction and the squelching of the movement." The crusade against liquor is not confined to the saloon-keepers. The apothecaries who sell spirits in various forms, and the physicians who prescribe intoxicating drinks, have also been attacked and in prescribe intoxicating drinks, have also been attacked and in prescribe intoxicating by the proportion of the movement of the proportion tacked, and in many cases pledges have been obtained from them. The druggists of Athens sent in a pledge which was not considered sufficiently stringent by the leaders of the women; so it was returned to them for reconsideration. The druggists them requested a consultation, which was granted, and it is understood that in the end they gave way.

It would appear that, in Ohio at least, the suddenness and in-

It would appear that, in Ohio at least, the suddenness and intensity of the movement have overwhelmed the sellers of liquor as well as their supporters, but some of the former have not succumbed without protest. A "hard-fisted dealer in Morrow," who had yielded to the women, changed his mind when he thought of his family. "Can you plead with me to quit my business," he asks, "while I have a wife and three little children depending on me for a living? I have no trade, and I feel it my duty to feed and clothe my little children, and my love for them cannot be broken."
"Kind ladies," he adds, "I signed your paper. I am not sorry for it, but I have some stock ale on hand, and eider and wine, and I want a committee of men to come and buy them." Other dealers have gone to hav against the temperance women. At Hillsboro', Highland County, an old dealer named Dunn says he has been damaged to the extent of 10,000 dollars by prayer, and claims compensation to the amount, but when the mail left no decision had been given. It will be interesting to know how the case goes. It may be assumed that the defendants will not seek to deny the efficacy of their prayers against the publicans, but will rather triumph in it. On the other hand, it may be contended that praying by mobs has a dangerous rosemblance to a physical force demonstration, and that if prayer is really efficacious in itself, it would be more convenient that it should be done indoors. A more commonplace ground of action against the praying bands is that they obstruct the streets and trespass on property which belongs to other people. If the whisky-dealers are wise, they will be content to put up their shutters in the meantime, and to wait for the inevitable reaction. It is impossible to suppose that the sale of liquor can be permanently put down by a sudden quthreak of fanaticism. The violence of the movement may be expected to exhaust itself very sous, and it is to be feared that the sale of liquor can be permanently put down by a sudden quthreak of fanaticism. Th

as a dead letter. In definee of the law liquere can be obtained in abundance either surreptitiously or under a name which is sourcely a disguise. In one of the States in which the sale of drink is prohibited a medicinal hewesage was lately introduced under the name of the Hop Tonic, and was largely patronized. A considerable body of citizens discovered that their constitutions required bracius, and partook freely of the new physic, which was found to be not unpleasant. After a time the authorities became suspicious, and when the Hop Tonic was analysed it was discovered, as might have been expected, that it was a very good sort of beer. Whether this particular preparation has now been finally suppressed we cannot say, but it may be taken for granted that, if it has, some other concoction has been devised to supply its place. There can be no doubt that the women of Ohio are right in directing their attack against the druggists as well as the liquor-dealers; since the craving for stimulants can be gratified by the former quite as well as by the latter. One result of the attempted extinction of the trade in ordinary liquors would no doubt be a rapid increase in the use of intense and dangerous narcotics.

**The most remarkable feature in the Whisky War is the abject

The most remarkable feature in the Whisky War is the abject efficient of the men. It would appear that the women are allowed to enforce their decrees without remonstrance or opposition from the male part of the community, except such as keep drinking-bars and saloons. Yet the fact that there were so many hars and saloons to be put down proves that these establishments must have been frequented by numerous customers. Some allowance must be made for the tendency to romance of American reporters, but it is impossible to doubt that the campaign which they describe is, at least to some extent, a real event and not a fiction. The submission of the men is, however, a circumstance which requires to be explained. There is an emotional side to the American character which occasionally produces startling results, and it is probable that the movement of the women is only part of an epidemic of religious hysteria which has also affected the other sex. In Nelsorville, we are told, "the war has developed into a Methodist revival"; but it would perhaps be more correct to say that the movement has developed out of the revival. The women claim to be endowed with the power of the Holy Spirit, and "fight zealougly, not only against drankenness, but against sin of every description." It has been reasonably suggested that the panic of September and the onsequent distress and anxiety have had a good deal to do wiff the paroxysm of piety and reformatory feeling which has lately sejzed many of the Americans. The Evangelicula are passing through a lever of revivalism, and the Catholics have also succeeded in establishing a rival enthusiasm in favour of pilgrimages. The temperance agitation is only another variety of the emotional epidemic. A wild fanatical outbreak of this kind is in itself a form of dissipation not far removed, either in its moral or physical consequences, from that which is indulged in by the frequenters of the whisky-bars. If the raid on the liquor-shops is only part of a general revival, it can be readily explained,

will soon become a mockery.

What chiefly deserves to be noticed about this agitation is that it is simply a form of mob intimidation which, in any country where personal rights were respected and reasonable freedom maintained, would be suppressed at once by the authorities. If the people who are new praying down the rum-shops and whisky-bars really believed in the efficacy of prayer pure and simple, they would be content to pray confortably at home instead of going out into the streets. The mere fact that the prayers have to be delivered in the presence of the saloon-keeper or in front of his door sufficiently proves that the prayers are directed, not to Heaven, but at the persons who are to be coerced. The Times, in that fieldly doctrinaire spirit which has of late unhappily become its second nature, has warned the publicans of England that, if they do not take care, they may come to be handled in the same way as the whisky-dealers of Ohio. It is impossible to suppose that the writer distinctly realized in his own mind all the conditions of a movement which, in point of fact, amounts to an absolute subversion of social order. In some parts of the United States there is a law against the sale of intexicating liquous; in other parts the sale is free and lawful. Where the trade is prohibited it is for the authorities to put it down; but that it should be possible for a trade which is perfectly lawful to be suppressed by mobe of howling women in the streets is clearly a violation of one of the first principles of government. Here is a description, by an inspertial writer, of the process of agitation:—

The women go to the bar-rooms in large companies—forty, fifty, or a

The women go to the bar-rooms in large companies—forty, fifty, or a hundred at a time—and pour first their supplications, lead, long, and all ingather, in the midst of the bottles and tebaseo. Perhaps I need not say that the prayers are strongly flavoured with personality, and interfere materially with the business of the saloens. The women are shrewd enough to take care that there shall be no intermissions for refreshments. When they have once swarmed upon a bar-room they never leave it until the keeper agrees to close the shuttent and quit the business. Morning, mode, and night the indies stick to their work. If your follows prayer, and prayer is taken up again when the seng dies away. Relays of women relieve such other. You see it is mainly a question of endamence.

It is perfectly plain that this is really not a service of prayer, but a

noisy physical terrorism, and that it ought to be suppressed by the authorities as a violation of public order. The women have of course a right to pray as ancel as they like, but they have not a right to pray just where they like—in anybody's house or a right to pray just where they like—in anybody's house out a right to pray just where they like—in anybody's house out a right to pray just where they like—in anybody's house out a front of his shopdour, blocking up all senses to it. The democratic and fanctical idea that the oud justifies the means, and that the will of the people must be carried out off and without the tedisms constitutional ceremonies of passing laws and entrusting the execution of them to responsible authorities under tried regulations, has perhaps made some progress in this country since it has been taken up by the Time; but we treat that we are still far off from the tyrauny of the mob is this blasphemous and diagnating form. Agitators have no more right to pray in the streets in order to intimidate private persons than to held meetings these for a similar object; and it is necessary to remander that a weapon of this kind is capable of a great variety of ness besides that of crushing one set of shopkeopers.

DINING A LA RUSSE AND OTHERWISE.

MONG the English fashions which least deserve the applicaof foreigners is that of calling things by fine names. who has lately written on social economy for the instruction of other ladies gravely inculcates the expediency of dining a la Russ. by which she explains herself to mean putting a joint on the side-board to be carved. If it were not alarmingly happingly we might suggest, as a further improvement, dining without hawing a joint at all. This lady thinks that the smell of fruit and Transmand the taste of meat do not blend well, and therefore she suggests, as the taste of meat do not blend well, and therefore she suggests, as an improvement upon the Russian mode, the substitution of "nice prettily-dressed vegetables in their stead." There is here a substitution of the practical to the elegant—or what is thought so—which we cannot enough admire, so long as we are at a safe distance from it. We should like to hear the comments of our old friend the author of the Original upon this idea of arramental vegetables. "The only convenient plan," he says, "is to have everything actually upon the table that is wanted at the same time, and nothing else." We fear that he cared little either for central flowers or for diamonds flaming in the screduled of the hostess. He thinks that gentlemen understand, what pertains to for central flowers or for diamonds flaming in the forelised of the hostess. He thinks that gentlemen understand what pertains to dimer-giving better than ladies, and bachelors fleats are generally popular. "Gentlemen keep more in view the real ends, whereas ladies think principally of display and ormament, of form and escenony." He notices as "a female failing" an inconvenient love of garnish and flowers, either natural or cut in Jurnips and carrots, and stuck on dislies so as to impode therving. "This," he says, "is the true barbarian principle of ornament, and is in no way distinguishable from the antutaged Indian's fondness for feathers and shells." But there is a still worse practice, and that is pouring sauce over certain dishes fondness for feathers and shells." But there is a still were practice, and that is pouring sauce over certain dishes to prevent them from looking too plain:—"I cannot distinguish this from that of the Hottentot besmearing himself with greese, or the Indian with red paint, with, I suppose, the american, for their practice." To his mind good most, well cooked, the plainer it looks the better it looks. His like of what dinners ought to be should be reprinted as a sixpenny book, and hold at the railway stations, as a companion, or rather contrast, to allow to Economize like a Lady. Instead of an inconvenient and usless centre-piece, he would have "a basket of boantiful broad, white and brown," in the middle of the table. There might be a preliminary difficulty here, for beautiful broad, like good water, can hardly be got in London. Each dish, as it is placed upon the table, ought to be accompanied by "the proper vegetables, quite dot." We almost wonder that the shado of Walker dots not return to carth to tostify against "nice prettily dressed dishes of vegetables," being We almost wonder that the single of walker does not general to earth to testify against "nice prettily dressed dishes of vegetables" being employed for decoration. "Spinach," says the ladar "specially lends itself to ideas of this kind," and she recommend it is in the form of a pyramid with young carrots ranged round it at regular intervals." It would be uncourteous at this moment to suggest that we can have too much of anything Russian, but really it is alarming to anticipate that our tables will be covered with ornamental vegetables. Garrick ridiculed a fashion of his time by wearing turnips and carrots when Sir John Brute assumed his wife's headdress, nips and carrots when Sir John Brute assumed his wife's headdress. The fashion of Russian dinners is likely to be similarly budgequed by those who take the manual published by Moesrs. Routledge as their guide to economical hospitality. The author thinks that "mashed turnips and carrots in ornamental moulds" may help to make "an extremely pretty table." There is perhaps someother massaal of the same series which explains, as part of the manners of society, whether these mashed vegetables age intended to be esten or only to be looked at. The practical Walker would say they should be caten, if at all, while hot, but then he was insensible to the mathetic value of a lump of pounded turnips moulded into a rule resemblance of a pine-apple. He was "an advocate for the use of dumb-waiters," and was wholly insensible to the dignity conferred upon a dinner by the attendance of a man in white cotton gloves from the grocer's. "It is necessary," he says, "not to be alraid of not having enough, or of the table-toking bare." In an economical point of view, there is this to be said in favour of the massive centre-piece, that the guests can neither eat nor drink it. But, in contemplation of the Original, it was neerly an impediment to conversation. "Enough is as good as a feast "in providing as wall as in esting." caten, if at all, while hot, but then he was insensible to the mathetic conversation.

It is a pity that the doctrine presched nearly forty years ago has .

made little progress up to the present time. We load our tables with unnecessary food, and in the generality of dinners there is no character but dull routine, according to the season. Walker was an enemy to variety of wines, and as he preferred only one wine with a particular dish he thought one wineglass sufficient. He liked to simplify as much as possible, and perhaps he as well as other philosophers pushed his favourite doctrine to an extreme. We rather think that when he describes such a dinner as he would give himself he does not mention water as either useful or we rather think that when he describes such a dinner as he would give himself he does not mention water as either useful or ornamental. Yet almost everybody, considers pure water in ahapely glass a desirable object to see, if not to taste. Walker mentions a dinner which he ordered on Christmas Day for two persons besides himself, and which the party enjoyed very much. "It consisted of crimped cod, woodcocks, and plum-pudding, just as much of each as we wanted, and accompanied by champagne." After dinner they drank mulled claret. It is as true now as when Walker wrote that most people mistake the doctrine of variety in their mode of living. "They have great variety at the same meals, and a great sameness at different meals." He observes that whenever the vegetables are distinguished for their excellence the dinner is always particularly enjoyed. He is as great an admirer of salad as the lady who would substitute it for flowers, but he regards it from a purely utilitarian point of view, and he would not have it upon the table one moment before it is wanted. "Excellent potatoes, smolding hot, and accompanied by melted butter of the finest quality, would alone stamp merit on any dinner." A foreigner who admired potatoes and melted butter as much as Walker did would have them served as a course by themselves, but Walker was too English to regard them otherwise than as an accessory to some kind of meat. A recent writer on English national characteristics wantited to remark this quairous devotion to the rotate. Walke not give himself he does not mention water as either useful or too English to regard them otherwise than as an accessory to some kind of meat. A recent writer on English national characteristics has omitted to remark this curious devotion to the potato. We do not, it is true, live on potatoes simple as the Irish did as long as they could, but in the estimation of nineteen-twentieths of our population this vecetable is absolutely necessary to a dinner. Talk to

could, but in the estimation of nineteen-twentieths of our population this vegetable is absolutely necessary to a dinner. Talk to poor people in a year of scarcity of rice or any other substitute for potatoes, and they will not understand you. Talk to your own servants on the same subject if you dare. It is irrelevant to remark that potatoes are dear and bad, for nobody can dine without potatoes. A few of Walker's remarks are addressed to women, whom we regret to observe he calls "females." In this essential affair of dining, says heighey ought to be especially on their guard not to divert their views from realities to show, to which they have a strong propensity. He would prefer a service of plain white ware to plate or ornamented china. He is no friend to dessert. He prefers fruit at any other time of the day, and thinks it unwholesome from being unnecessary. Preserved fruits are injurious to digestion and confectionery will more so. Walker chose to dine only with agreeable people, and had never perhaps experienced an inclination agreeable people, and had never perhaps experienced an inclination to partake of wonderful pink and green structures as a diversion from insufferable twaddle. Desserts, Walker says, are instruments of show more than dinners, and though, unlike dinners, they can of show more than dinners, and though, unlike dinners, they cannot be spoiled by it, yet they are a temptation to excess. He thinks that the discreet host would set nothing before his guests except what they dught to take. The idea of using the dessert as an ornament throughout the dinner would have been put aside by him as only suitable for "females," nor would he have considered it less barbarous because it presented itself as Russian. In his view a dinner-table was a table to place dinner on, and nothing more. Economy was not the primary object with which he wrote, but we doubt whether any economical lady or gentleman has written so well on dinner-giving since. "Delicacies," he says, "are secreely ever brought till they are quite superfluous, which is unsatisfactory if they are not eaten and pernicious if they are." Among the most wasteful modes of providing dinner was that which used to prevail at the students' tables in Lincoln's Inn Hall. On what was called "grand day" there would be for each mess of four men first a piece of boiled beef, on which an ignorant freshman might perhaps incautiously beef, on which an ignorant freshman might perhaps incautiously dine, and then a roast turkey. Walker could, we think, have written some forcible remarks on such a bill of fare. Indeed he written some forcible remarks on such a bill of fare. Indeed he observes, on an analogous case, that it would be better to serve woodcocks before the joint. At Lincoln's Inn, however, you could, if you knew of the turkey, reserve yourself for it, whereas we have heard of an old-fashioned lady who at a modern dinner-party reserved herself for the game, and consequently got almost no dinner at all. In the last century the hostess loaded her guests' plates again and again with the choicest parts, as Thackeray has described in the Virginians. Walker derived his ideas with modification from the same vigorous source. He had no idea of handing to a guest a bit of hare or pheasant no bigger than a half-crown. Beer avay Mr. Swiveller, cannot be tasted in a sin. a half-crown. Beer, says Mr. Swiveller, cannot be tasted in a sip, and of a dish that is really fancied one would like more than a mouthful. The folly, as Walker calls it, of sending to London for turbot when the best trout is close at hand has now become almost universal. Yet we shall all admit the soundness of a remark on which we are certain not to act. "In general it is best to give strangers the best of the place. They are then the most sure to be pleased."

Walker describes a "choice plain dinner" which he gave in a friend's chambers in the Temple, where dinners are not often

Walker describes a "choice plain dinner" which he gave in a friend's chambers in the Temple, where dinners are not often cocked or eaten nowadays when every man has his Club. The party were six in number, all accustomed to good living, and one of them habituated to one of the most salebrated tables in London. The dinner consisted of, first, spring soun from Birch's in Combill; then a moderate sized turbot, bought

in the City, beautifully boiled, with lobster-saues, cacamber, and new potatoes; after that, ribs of beef from Lesdenhall Market, roasted to a turn, and smoking from the spit, with French beans and salad; then a very fine dressed crab; and, lestly, some jelly. The owner of the chambers undertook specially to order the different articles, which could not have been exceeded in quality, and though the fish and beef were dressed by a Temple laundress, they could not have been better served. The dessert consisted only of oranges and biscuits, followed by anchovy tosst. The wines were champagne, port, and claret. "State ornament and superfluity" were excluded, and we reluctantly infer that the only "female" who had anything to do with this dinner was the laundress who cooked it. The author never saw such a "vividness of conviviality" at or after dinner. Although we think our modern adviser far inferior to Walker, yet she makes some practical remarks. "As men rarely cheer up completely before they have finished their soup and fish, the hostess must especially exert herself at this time." If there are not vegetables enough to cover the table, she recommends a plate of rolls in napkins, which would look nice, and also be convenient. Walker would have joined in this recommendation, but exclusively for the latter reason. He calls some of his own dinners "herrings-and-hashed-mutton" entertainments; and if a recent writer is correct in representing hashed-mutton as a speciality of the English nation. Walker must have been as indeed he was, thoroughly an correct in representing hashed-mutton as a speciality of the English nation, Walker must have been, as indeed he was, thoroughly an Englishman. We will only add, as a matter of almost historical interest, that among the dinner-party in the Temple was Sir James Scarlett, afterwards Lord Abinger. Few people would think nowadays of inviting such a man to such a quiet, modest feast.

REVIEWS.

THE MISHMEE HILLS.

IN the year 1868 the author of this work traversed the Chinese L Empire from East to West, and made a bold attempt to enter Thibet and to establish a communication with India. How he was baffled in the neighbourhood of the town of Bathang, only two hundred miles from one of our frontier stations in Upper Assam, by the hostility of the priests, and how he had to re-trace his steps, has been already told to the public. The present volume is the record of his adventures and efforts to get across from Assam, through frontier tribes and over high ranges of mountains, into Thibet. His leading idea is that, although the nature of the country precludes traffic between the two kingdoms are alarm and a new market wight be around for the tea groups. nature of the country precludes traffic between the two kingdoms on a large scale, a new market might be opened for the tea grown in Assam, if the Thibetans could be persuaded to rely on this latter country for their supplies, instead of on China. Impressed with this view Mr. Cooper came round from Shanghai to Calcutta, was introduced to Lord Mayo, and discussed the whole subject of a trade route overland with him and with the leading merchants of the Presidency. When it was quite clear that the Government could not, and indeed ought not, to lend Mr. Cooper its official sanction, or to spend any of its funds in such a venture, the sum requisite, being 6004. was provided by the Chamber of the sum requisite, being 600l., was provided by the Chamber of Commerce; and towards the close of the hot season of 1870 Mr. Cooper started by rail and steamboat on his journey to the furthest

other started by rain and steamboar on his journey to the furthest station in the jungles of Upper Assam.

We confess to have read the opening chapters of this book with eagerness, and to have dropped it with some feeling of disappointment after perusing fifty pages. The author gives us his experiences and shorting times from the page of shorting times from the page of shorting times. of shooting tigers from a howdah, and of spearing hogs in the disof shooting tigers from a howdah, and of spearing hogs in the district of Maldah, now threatened with famine, and a brief account of the annual fair at Hurdwar, the place where the waters of the Ganges leave the mountains to be intercepted at Roorkee by the Solani aqueduct. Now such sporting adventures have been described, literally scores and hundreds of times, during the last century; and Mr. Cooper's experiences on the railway, on the back of an elephant, in the Assam steamer, or with free and easy hotel. keepers, are neither so striking nor so exceptional as to warrant publication. Enough, too, has been published about the Ganges Canal. Then, again, this book is an example of the danger of a traveller outstepping his own province and entering the region of historical inquiry or political discussion. Nothing can be better than Mr. Cooper's manner of describing how he catered and cooked and encamped in the forest, or how he conquered the reserve of a sus-picious savage chief. But some of his remarks on the history and picious savage chief. But some of his remarks on the history and administration of Assam are superficial, and nothing can be more crude than his censures of the Indian Government because it thought fit to interpose its authority for the protection of the natives against the possibility of oppression by the ten-planters. Mr. Cooper is certainly correct in saying that a race of princes termed Ahoms conquered Assam some centuries ago; that the country was ruined by civil wars at the close of the eighteenth and the beginning of this century; that, when the reigning sovereign asked for our intervention in 1793, we sent a certain energetic Captain Welsh, who, with little more than a regiment of Sepoys, cleared the country of freebooters, and drove back a troublesome set of people called Muttocks; and that the Burmese invaded the province in 1821, and were not expelled until the end of the first Burmese war in 1826. But Mr. Cooper makes no

^{*} The Mishmer Hills: an Account of a Journey made in an Attempt to Penetrate Thiset from Assum to open New Routes for Commerce. By T. T. Coeper, P.R.G.S. London: Henry S. King & Co. 1874.

metrica at all of the Mahammedan conquest of Assam, effected by Assh-Junks, one of the most capable of the Heutenants of Aurangashe, or of our unlasky attempt to try what government by natives would be like, when, in 1833, we made over Upper Assam to a Rajah named Porendra Sing. This puppet could neither pay tribute, nor manage his subjects, nor ensure order, and we very soon had to abandon the experiment, which Lord William Bentinok, in a moment of wealmess foreign to his character, had been induced to sanction. As regards the cultivation of tea, the emocaragement to English capitalists, and the legislative measures which the Government of India deemed indispensable for the protection of immigrant native labourers, Mr. Cooper has clearly heard only one side of the story. That Assam has a rich and, in some places, a virgin soil; that the discovery of the indigenous tea-plant there gave hopes, since realized, of the successful cultivation and manufacture of tea; that the abundance of waste lands rendered it possible for Englishmen to acquire at a moderate cost something like that complete ownership of the soil which high prices, a tesming population, and complicated revenue systems rendered impossible in our older provinces; and that it is good and sound policy to invite energetic and vigorous Englishmen to build houses, own lands, take root, and become cantres of social strength and activity in our Indian possessions, is all perfectly true. But when Mr. Cooper thinks that the tea-planters ought to have been allowed to "procure labour in their own way, consistent with justice to the labourer," and when he taxes Indian statesmen with destroying progress by listening to unjust reports of cruelty, he evinces a complete misapprehension of the real history of our protective legislation, and hastily disposes of one of the most difficult of all the political problems which a high-minded and impartial statesman is constantly called on to face. In 1861, from certain causes, tea-plantions in Assam became the rage. The off

It is a pleasure to turn from Mr. Cooper's hasty strictures on the Indian Government to his straightforward, unpretending, and yet, impressive account of his own hardships and adventures. As a record of endurance, tact, decision, and mastery over crafty or suspicious savages, it must take a high rank even in days when most of the mysteries of Africa have been solved. Our regret is that the main object of the explorer was not attained. Mr. Cooper's plan was, to all appearance, very feasible and simple. He had to make friends of a tribe called Khamtees, to be sent on by them to the Mishmis, over a wooded range of mountains, and somehow to find his way into Thibet. For this he required an interpreter, some guides, and animals or men to carry his provisions. Mr. Cooper gives some very cogent and characteristic reasons for not taking an English friend or associate with him in such expeditions. In a party of three or four tastes are sure to differ. The scientific surveyor wishes to push on. The geologist, on the contrary, lags behind to examine the strata. The naturalist starts off at a tangent to pursue a strange bird or insect. The trader leaves the jungles and looks out for the inhabited parts of the country. Quarrels and disagreements arise. A solitary individual consults his own wishes, has less baggage to carry, and succeeds better with the wild men of the woods. Mr. Cooper, however, forgets that, in sickness or danger, one Englishman can nurse or protect the other. But we fully admit that he has made out, in theory and in practice, a capital case of his own.

On the 20th of October, when the tremendous deluges of the rainy season had ceased, the explorer set out to beard in his own village the young chief of the Khamtees, named Chowsam, whom he had never seen but once, and whom his interpreter and native attendants regarded with the dismay with which Andrew Fairservice, when attached to Frank Osbaldiston, looked on Rob Roy and the Highlands. The description of this man's personal appearance, his hauteur and intelligence, his fine eyes, Roman nose, and firm-set mouth, is very graphic; but he succumbed to Mr. Cooper's admirable tactics and two or three glasses of gin. Some other difficulties had to be get over, but eventually everything was made smooth, and though the knives of the Khamtees were ready on the smallest provocation to leep from their scabbards, the unprotected Englishman made himself respected, admired, and almost loved. The Khamtees lodged him in the quarters set apart for bachelors, as distinguished from a place which, from innate ideas of propriety, is reserved exclusively for the unmarried of the other sex. They got up night fishing on a grand scale, by togahlight, in his honour. The most aged of the elders of the village commended him to the care of Chowsan in a speech which, for point and condensation, might have been delivered by a Spartan to a delegate of the Persian monarch. And so the party set out through the shades of a forest no lefty that they never suffered from heat, though dostined to

undergo very serious hardships from the climate and its pesta, and from scantiness of supplies. At one place they were narrly charged by a herd of matter, described as a srose between a buffalo and a bull, and fiercer than the rintedecret. As the supplies of the party, never very ample, decreased, they were reduced to live on a species of water-beetle, exuding "a liquid resembling walnut juice, of a strong but not unpleasant odour"; on the seed of the sage palm, mixed with becawax and "unpalatable"; on a few tiny fish, stewed with yam leaves; on thin chickens, and bleeding pork; and on a mess called pebess, which we make out to be composed of rice grown in the hills, and very sandy and gritty. To the inconveniences of short commons must be added the bites of leeches which festered, repeated attacks of fever, inflamed ancles, and enlargement of the spleen. But nothing could wear out the pluck of the one solitary Englishman. Chowsam, it must be admitted, behaved capitally, refused to endanger the life entrusted to him or to take Mr. Cooper near a clan whose chief had murdered two missionaries, undergo very serious hardships from the climate and its posts, capitally, refused to endanger the life entrusted to him or to take Mr. Cooper near a clan whose chief had murdered two missionaries, and marched him into the country of the Degaroo Mishmia. But here unforeseen impediments were met. A chief named Poso was extortionate and inhospitable, and roused the pride of the Khamtesleader, while matters were scarcely improved by the conduct of a negro of the retinue, who got drunk, insulted the Mishmi women, and flourished a revolver. Between this Poso and another chief named Kayanne, and then a third one, Bowsone, had of a tribe named Kaysong, and then a third one, Bowsong, head of a tribe of Mejn Mishmis, the plot began to thicken; and after some shuffling and subterfuge, it transpired that the Chinese or Thibetan authorities at Roemah in Thibet had fully made uptheir minds to have nothing to do with commercial travellers, and if necessary to drive them back by force. Its vain was and if necessary to drive them back by force. In vain was Chowsam plied with pipes and promises of five hundred rupees; in vain were appeals made to Samang and Nhatsong. However, the mighty explained to the stranger the customs of the tribe in respect of marriage and burial, and celebrated the New Year by slaughtering a yak in honour of Queen Victoria; but no one had the means or the will to annul the Thibetan edict. So, with hadled hopes and weakened frame, Mr. Cooper retraced his steps to Sudiya. But it is quite clear that, instead of getting us into another little war, or leaving discontent and irritation behind him, he has conciliated two important tribes, while he has added considerably to our knowledge of those unknown regions, and has shown it to be posoffished two important tribes, while he has added confiderably to our knowledge of those unknown regions, and has shown it to be possible for an Englishman, without official pressite or protection, to impress savages by skill in handling weapons and by sheer force of character. One of Mr. Cooper's maxims deserves especial recommendation for all who may have to negotiate with savages. If mendation for all who may have to negotiate value own it. On you understand the dialect spoken, be not too ready to own it. On the work of the contrary, use an interpreter, so as to gain time. While the latter is translating what you already know the purport of, you will be able to form your resolutions and to frame your reply. Next to prowess and hardihood, nothing seems to take such a hold on the imagination of unlettered savages as dignified, sententious oratory, or happy repartee. Mr. Gladstone in this point would have no chance with Mr. Disraeli. Mr. Cooper gives us one or two specimens of his conferences, from which a Cabinet Minister might take a lesson in answering a deputation or confuting a troublesome questioner at the hustings. Parts of the country explored by Mr. Cooper were visited by two adventurous young officers, Lieutenants Wilcox and Burlton, so far back as 1823: And about 1826 Captain Bedford went a good way up the Brahmaputra, and the latter officer reached the spot known as the Brahmakund or "well of Brahma," described by Mr. Cooper at Brahmakund or "well of Brahma," described by Mr. Cooper at p. 180. Hindu legends say that one of their mythical heroes, Parasurama, opened here a passage for the river by cutting the hills with a blow of his axe. Hence the place is known locally as Brahmakund, or as Dev l'ani, "The Water of the God," or as Prabhu Kathar, "The Lord's Axe." Mr. Cooper says that he was disappointed with the view, as he had expected to find a gloony gorge with the river forming a large lake. Instead of this he saw only thing will falling into a days transported by the river had been say and bentance with the river forming a large lake. a tiny rill falling into a deep reservoir, and banks not more than two hundred feet high. Earlier reports are counted in more laudatory terms, but probably a great deal is to be ascribed to first impressions and to the remoteness of the spot. But no difference of opinion about romantic scenery will prevent Mr. Cooper from taking a high rank amidst the venturous pioneers of foreign exploration, and no Englishman will read the last two hundred pages of his travels without high approbation of the temper which is never ruffled, and the fortitude which never fails under disappointment

BLUNT'S DICTIONARY OF SECTS.

Dictionary pass in somewhat contemptuous review a host of writers who have treated of their subject before them. One of these is a certain Evans (A.D. 1827), whose Sketch of the Various Denominations of the Christian World is pronounced to be "a work of the most flimsy character," based upon "authorities of no value," "yet perhaps the most popular book of its kind." We have not seen that little volume for many a year, but Mr. Blunt and his colleagues would have done well to mark one of its special features which we well remember, and to which no doubt it owed the de-

Dictionary of Sects, Heresies, Ecclesiastical Parties, and Schools of Religious Thought. Edited by the Rev. John Henry Ithan, M.A., P.S.A., Editor of the Dictionary of Doctrinal and Historical Theology" and the Annotated Book of Common Prayer," &c., &c., London, Oxford, and Cambridge: Rivingtons. 1874.

gree of public favour formerly accorded to it. The author, himself, we believe, a Unitarian, managed to procure and insert in their proper places statements relating to the tenets and peculiar practices of other sects and communions, drawn up by members of the several denominations which he undertook respectively to describe. Such a plan, as hardly need be said, has obvious inconveniences of its own, but it furnishes at any rate a powerful antidote to that vulgar prejudice and unchristian scorn which even in reverential hands are wont to be engendered by the very nature of an undertaking like this, and which perhaps have seldom been brought into more painful prominence than in this bulky and, in many respects, useful compilation. Evans himself, we suspect, could hardly have put forth an article at once more flimsy and unbecoming than the following on the

Cogless.—A set of tectotaliers having their origin at Kirdford in Sussex, and also known as "Coulers." A man named Sirgood was the first teacher of the sect, the chief characteristic of which is Antinomianism, its members considering themselves (but not being so considered by their neighbours) to be incapable of committing sin. They are said to have a "Book of Cople," in imitation probably of the Mormonites.

This is literally all. The date of the soct's origin, their numbers, the meaning of their strange name, the character and contents of their book, are matters deemed unworthy of notice. All we are told is that they think better of themselves than they can persuade their neighbours to think of them; no unusual case surely with soct or party, heretical or other.

We have not met with many notices scattered through this volume at once so defective and so flippant as the above, but a little of this kind of thing is too much, and wherever modern and surviving sects are concerned, it is easy to note an utter lack of that breadth of view and dispassionate judgment which the occasion demands. Mr. Blunt, we suppose, would not object to be regarded as an English Churchman, rather of the Catholic than of the Protestant school—the school of Andrewes and of Bramhall, if not of Land; yet the writer of the ten lines on "Anglicans" complains of this party as "inheriting" some of that narrowness and want of sympathy by which the seventeenth-century divines were characterized in their dealines with foreign Churches and with Dissenters at home. "The Ritualistic movement" is still less to the taste of the writer of "High Churchmen." "There was much," he says, "to prevoke opposition in the ritual adopted by this younger school of Ritualists—very inferior in modern Continental customs, and was mixed up with a sentimentalism about candles and flowers, as well as with an excessive minuteness in regard to postures and gestures, which made it cass to charge the school with trifling and want of manliness." Of the Low Churchmen, again, we are told that "no high literary power was ever developed under the wing of the party. The good that was done by the Evangelical school in reviving personal religion was largely counterbalanced by the recklessness by which they neglected education both among the clergy and the laity.

The Evangelical clergy entirely failed to guide the intellect of the country in their sermons." But the "Broad Churchmen," the disciples, not of Arnold and Maurice only, but of Whately and oven of Archdeacon Hare, fare so badly that we must relate their sad case at longth:—

BROAD CHURCHMEN.—A modern school of latitudinarians, composed of those clergy and luity of the Church of England who dissent from the principles developed during the revival of exact theological learning. The designation "Broad" has been assumed as expressive of the comprehensiveness which the theology of this school offers to men of various opinions; but its scarcely a fitting designation, as well defined opinions of a positive kind are not included. The most distinctive characteristic of the Broad Church school is, in reality, its rejection of traditional beliefs, and the substitution in their place of what has been aprly called a "Negative Theology," in which much is doubted and rejected, and very little scheved.

For our present purpose it matters little whether all these off-hand judgments are true or false in the main. They are wholly out of place where we find them, and can do little good anywhere, we should imagine. In discussing schools of thought within the English Church, however, Mr. Blunt's contributors bring to their task, if not a profound or even thoughtful appreciation of principles, at any rate a competent acquaintance with patent facts. When we turn to their articles on the various Nonconformist societies, we cannot fail to be impressed at once with the unagreness of the information supplied, as well as with the utter want of sympathy even with the better features of the respective systems. Of course these societies are all involved in the guilt of schism, as "wilfully outing themselves off from the apostolical succession of bishops by which the organic unity of the Church is maintained within the boundaries of a state and nation" (p. 524). Those who use this work have no right to complain of it for upholding a theory which is at all events intoligible and self-consistent, though to some the inferences derived from it may seem a little bold and comprehensive. "Organized schisms have been formed in England by the Roman Catholics and by the various sects of Protestant Dissenters, in Scotland by the Presbyterians, and in Ireland as in England by the Roman Catholics and Protestant Dissenters" (bid). Our complaint against Mr. Blunt is that, if he deems it worth his while to publish a Pictionary of such sects, he ought to have taken near to have learnt a little more about them. The Baptists, for example, are an important and influential sect, yet the second of their history overlooks the most oloquent of their preschers, Rebert Hall, who would have been an honour to any communion, and makes of Mr. Spurgeon only to compare him with the wretched

William Huntingson, S.S. (p. 206). We are no great admires of the oracle of the Newington Thernack, but it is impensible to glance at a single page of his reported sermons without discovering in the man a force of mind and readiness of wit enough to show that he owes his enduring popularity to somewhat higher qualities than an iron voice and brazen forchead. To Methodism as olaborate article is devoted, wherein the logical contradiction between John Wesley's Church principles and actual practice is miturally and justly set forth, but one great characteristic of his system, the revival, is barely, if at all, noticed. It is because the modern Wesleyan has seen too much of the ill effects of more physical excitement in religion, and thus has learnt to distrust the spasmodic enthusiam which revivals engender, that the Swintry daly notices. The more educated members of the body grow ashamed of them, and return quietly to the Church of their inthems; the illiterate or untrained feel a thirst for something which in the Wesleyan body can be found no longer, and join other communities whose tone and spirit are more congenial to their eventually occupy much more of the ground once covered by it. The schiam in which the Reformed Methodists took their rise is not grounded in the nature of things like that just mentioned, but sprang from an act of mere wanton tyranny on the part of the ruling Hundred in Conference, who imposed upon three of their own members a solemn declaration that they were not the authors of certain anonymous paniphlets which severely criticized the policy and proceedings of the majority, and, on their refusing the test, visited the offenders with summary expulsion. We respectfully commend their vigorous action to the institution of that energetic prelate, the Bishop of Purham. It would be easy to notice many other instances in which slight er inaccurate information must inevitably disappoint a reader who may consult this volume in the hope of learning the tenets and actual condition of English sects. T

But our chief complaint against Mr. Blunt's volume affects rather its general plan and treatment than its details, however much these may be susceptible of improvement. On his title-page he touches the key-note of his composition by means of two short mottoes—"Let both grow together until the harvest," and Hikary's famous dictum, "Lis corum ides nostra est." The three pages which follow contain "A Classified Table of the Principal Contents"; and a fearth page exhibits a "Genealogy of English Church Parties, and of the Chief English Sects," wherein the "Unitarien Sect, A.D. 1719," figures as one of the children of the "Puritan ex Presbyterian Party of Reformation age." These tables, and a rather poor Index at the end of the work, are the only guides the Editor thinks necessary before an inexperienced reader plunges into the forest of controverted matter which he has crowded into his Diotionary, arranged, of course, in the accidental order of the letters of the alphabet. We cannot understand why Mr. Blunt should have had so little consideration for these whom he is evidently anxious to instruct. A fair acquaintance with "Schools of Religious Thought," which must needs include a description of sectarisan dogmas which are mutually contradicter, is a necessary part of all mental cultivation, yet it is dangerons enough to some minds, to others repulsive in the highest degree. A few broad general principles which might furnish the young student with a clue for threading the intricate labyrinths of human speculation, a few precepts which might inculent caudour and moderation in forming our judgment, without tempfang us to doubt the existence of objective truth, might ossily have been worked into a preface or introduction, wherein the private opinions and idiosyncrasics of the editor might have been expressed freely and without censure. It is the more to be regretted that this some writers who might have performed the task attisactorily enough, so far as literary skill and temperate judgment are concerned. The article o

that the more charitable view of his scheme is the true one. We subjoin in full this so-called creed:—

subjoin in full this so-called creed .—

I believe in one Infinite and Undivided God, Eternal, Undangeable, endering and acting by the sole necessity of his nature; of Infinite attributes, whereof two only are capable of being conceived by man.—Extension and Thought, whereof he himself is the identity; of all things the free cause, immanent not transient; in whom all things consist, and without whom nothing can exist or be conceived; by whom all things are made; not truly by design or for the sake of any end, contingently, of free will or absolute nature or infinite power of God.

Of which world is Man, whose consciousness is the base of all certitude, in which whatsoever is clearly perceived is true, and exists objectively in mature; whose will is not free, but necessary or constrained; whose acts and desires alone are good, so far as they are defined by reason; and whose acts and desires alone are good, so far as they are defined by reason; and whose acts and ternat knowledge and love of God; whose worship by man consists in the exercise of obedience, charity, and justice. I believe in the communion and fellowship of all men so far as they are led by reason, and in the oternity of the mind. of the mind.

But the simple story of Spinoza's last hours will bring before us the real man better than all these abstract metaphysics:—

On the Sunday on which he died he would not allow his host and hostess to stay from divine service to wait on him, particularly as it was their purpose to partake of the Holy Communion.

When asked by his landledy respecting her religion, he replied, "Your religion is a good one, you ought not to seek another, nor doubt that yours will procure you salvation, if you add to your piety the virtues of domestic life." Waiting patiently, on their return from service, he talked with them after a friendly sort about the sermon, and presently settling into a calm, expired in pcace.

There are, no doubt, many articles in this volume as interesting and as exhaustive as that on "Spinoza," especially such as treat of subjects which border on the region that separates philosophy from religious faith. Much labour also has evidently been be-stowed on the ancient heresics, especially on those relating to the mystery of the Holy Trinity. But, taken as a whole, we cannot mystery of the Holy Trinity. But, taken as a whole, we cannot help regarding the Dictionary as executed very unequally, those parts which refer to modern sects or controversics being both in tone and substance incomparably the least valuable. What, for example, can be in much worse taste than the article on the "Irvingites," with its perpetual imputation of interested motives to those who were most conspicuously mixed up with that strange delusion? That shrewd men of the world like Henry Drummond should have yielded credence to the utterances of the hystorical signstephood is mutter enough in itself for grief and would; without sisterhood is mutter enough in itself for grief and wonder, without our being incessantly reminded that one of them was a poor farm drudge, and another a governess. Mr. Blunt may perhaps remomber that there was a period in the history of Christianity itself wherein it could be said that the foolish and the weak and the base things of the world had been chosen to confound the mighty and the wise. We do not imagine that Mrs. Oliphant has much sympathy with the sect to which poor Edward Irving's wandering intellect gave birth; yet in how widely different a temper does she speak of the

orth; yet in how widely different a temper does she speak of the intellectual degradation of his closing years.

One of the critics who reviewed a previous compilation published by Mr. Blunt was pleased to call it "a box of tools for a working clergyman"; and indeed, if such volumes as the present have any well-grounded reason for their existence, it must be for the daily use of such of any activities. the daily use of such of our spiritual teachers as, scattered throughout country villages, have no ready access to original sources of information. It is right, therefore, that these persons should be informed that the tools which have been placed within their reach are edged tools, very likely to wound those who use them without care and circumspection. A slovenly and illconsidered compilation, such as on the whole we must pronounce this Dictionary to be, is at once a discredit to English theological learning and a direct hindrance and discouragement to better scholars, who might otherwise have been tempted to undertake and carry to its completion the same task at once more thoroughly, more accurately, and in a spirit of less glaring partiality.

ROBERT DALE OWEN.

NDER the not very significant title of Threading my Way, Mr. Robert Dale Owen, the son of the well-known Socialist, has been publishing a series of autobiographical articles in the Atlantic Monthly. They are now collected in a volume which records Mr. Owen's recollections of the first twenty-six years of his life. In America Mr. Owen has made some political reputation: in England he is perhaps chiefly known as one of the most tion; in England he is perhaps chiefly known as one of the most prominent retailers of the marvels of Spiritualism. In this volume, however, there is little reference either to the Spiritualism or to the politics—a fact which certainly does not diminish its interest. Mr. Owen indeed has written a very pleasant little book. The style is simple and fresh, and his memories of early life bring before us some curious scenes from a state of society which already strikes us as very quaint and old-fashioned. Mr. Owen was bord. at New Lanark, the scene of his father's first and most successful social experiment in 1801. He gives us many anecdotes pleasantly significant of the relations between his father and the artisans over whom for many years he exercised a beneficial away. The success indeed which the elder Owen obtained appears to have turned his head. He was a self-made man who had

started in London with little more than the proverbial halfcrown; and who had not only made a fortune, but become a philanthropist of European celebrity by the time he reached middle life. The visitors to Lanark came from all parts of the world and included men of the highest rank and reputation. Mr. Owen alla a page with a list of eminent statesmen and thinkers who had shown more or less interest in his schemes. All the reformers and economists of the day, such as the whole school of Bentham, Clarkson, Cobbett, Wilberforce, Zachary Macaulay, Brougham, Mackintesh, and others were amongst his acquaintance. Imperial and reyal guests had come from Russia and Germany. When he visited Paris, he was invited to a seat in the French Academy; and he was introduced to La Place, Humbodta, Pestalouri, Madame do Stael, and a number of other celebrities. Certainly, for a poor Welsh shopboy, he had done well.

The story of his rase is briefly repeated by his son with some fresh anecdotes. The original proprietor of the mills at New Lanark was David Dale. He had entered into partnership with Arkwright in order to enjoy the advantage of the great invention to which the cotton-manufacture owed its first rice. Arkwright came to Scotland to see the mills, and at the first vn more or less interest in his schemes. All the references and

wright came to Scotland to see the mills, and at the first view expressed the highest satisfaction with the choice of the site. One thing alone struck him as not being all that could be wished. The factory bell was hung in a cupola at one end of the buildings. Arkwright said that it ought to have been in the middle. Inde stuck to his point, and said that a man must be blind not to see that the bell was in its proper place. The dispute became so warm that each of the partners swere that he would have nothing to do with a man so obstinate and wrong-headed as the other. The end of it was, that Inde and Arkwright went back to Lamark and dissolved partnership that night, Dale went back to Lanark and dissolved partnership that night, Dais romaining sole proprietor of the village and mills. Sixteen years later Robert Owen came to Scotland on business and fell in with Dale's daughter. Her father did not consider him to be a suitable match; till he persuaded some capitalists who had confidence in his abilities to buy the mills of New Lanark and set him up as manager. He then married Miss Dale, and atterwards became the chief proprietor of the business. Robert Dale Owen, the eldest child of the marriage, was born in 1801, and brought up in strict Presbyterian principles. His father, though a thoroughgoing sceptic, was tolerant in his family, and young Owen accepted his mother's creed. As he grew into heyhood, he began to suspect that his father's orthodoxy was not as strict as could be desired. He accordingly resolved to convert his parent to the true faith. He carefully prepared a conflusive refutation of the supposed hercaies, and opened proceedings by asking his father one day whether he believed in the divinity of Christ. The father replied in the Sociatic method by asking the son whether he had ever heard of the Mahommedans? The statistical fact gradually dawned upon the young zenlot that the Protestants, to whom alone he conceded the name of Christian—the Pope, of course, being Antichrist in Scotland—were a small numerical minority in the world. Having previously imagined that the whole human race, with a few insignificant and wicked exceptions, were rigid believers in the doctrines of Knox, he was completely stappered by this discovery. His father's conversion had to be postponed; and, indeed, it was not a very hopeful undertaking. He was a thorough unbeliever of the school of Godwin or Bentham; and, unfortunately for him, his unbailed was by no means of the purely negative order. On the contrary, he founded upon it some very positive and erroneous degmas, which led to the ultimate rule of himself and of his schemes for the regeneration of humanity. It was in 1817 that he announced to the world the principles which were to lead to this desirable consummation. He hold three public meetings in the London Tavern. Public attention had been warmly excited by the first two; he had had an interview with Lord Liverpool, who received him most ameiously, and said that he might make any use he pleased of the names of various members of the Cabinet short of implicating the Government. Lord Liverpool, we may imagine, had but a very vague notion of The newspapers had remarked, it appears, on what was to come. the absence of any reference to religious questions in the lirst two meetings. Owen thereupon took a resolution, which he exrefully concealed from everybody else in order that he might be alone responsible; and this resolution was nothing less than, in his own words, "to renounce and reject all the religious of the world." This was a pretty programme for a great social reformer addressing a crowded audience of philanthropists and enthusiasts of all He declared to the meeting that human pro-chiefly arrested by the "gross errors under-y religion that has hitherto been taught to characters. lying, We do not know how this announcement was received man. at the moment. Owen, however, had no notion of reticence in any shape. He bought thirty thousand copies of the newspapers which appeared on the days succeeding each of his lectures. He printed forty thousand copies of each lecture in pamphlet form. He spent upon the printing and posting of these documents four thousand pounds in two months; and the London mails, we are told, were delayed twenty minutes beyond their usual time by the bress of the matter which they had to carry. It is not wonderful that after this proceeding a good many of his respectable supporters drew back, and that he became a notorious instead of a celebrated themselve though the days of attendance to the sector. character, though the days of actual martyrdom were passed. It was not, however, until 1825 that he purchased the village of Harmony, near the Ohio River, previously colonized by a commu-

nity of Rappists. Thither Robert Dale Owen accompanied his father and tried the experiment which, as is well known, was a speedy and complete failure, and involved the ruin of its founder.

Meanwhile, however, young Owen had various experiences of a different kind, of which some interesting anecdotes are given in this volume. He was sent to school at the age of sixteen at the college founded by Fellenberg in the village of Hofwyl near Berne. Fellenberg was one of the chief educational reformer of those days, and his school was an embediment of various novel. those days, and his school was an embodiment of various novel theories. The most characteristic peculiarity was that Fellenberg resorted to the principle of self-government amongst his pupils. There were about a hundred students of ages varying from fifteen to twenty-three. They obeyed a constitution drafted by a select committee from their own body, adopted by vote, and approved by Fellenberg. The professors had no authority except in the classrooms, and the self-imposed laws were enforced with little difficulty by means of public opinion. There were no prizes, and competition was discouraged by the whole system of the place. competition was discouraged by the whole system of the place. Such an experiment tried upon a heterogeneous collection of lads from all quarters of Europe might be pronounced dangerous; but, if we may take Mr. Owen's word for it, it was a triumphant success. Indeed, his memory of the general harmony, good-will, and high moral tone of the college, paints it in such glowing colours that he is forced to make various protestations of his sincerity and accuracy. The only remark which he makes of anything but a most eulogistic tendency is that the standard of learning did not reach a very high points and he admits that this ing did not reach a very high point; and he admits that this may have been partially due to the absence of artificial stimulants. We think it very probable, and it must be admitted that such a confession is a considerable drawback from praises of an educational institution. The secret of the admirable preservation of discipline is given in another significant remark. The great days of the college, he tells us, ended with Fellenberg's life; under the inefficient management of his son it dwindled down to be an ordinary boarding-school. In fact, we have no doubt that a man of strong character, and of a capacity for influencing youth, can disponse in the management of a college with many of the disciplinary regulations which are found necessary elsewhore. The personal influence of Fellenberg was doubtless the true secret of whatever success was obtained, although he preferred to exercise it indirectly without the ordinary apparatus for enforcing order and

diligence.
Robert Dale Owen returned to New Lanark, after having more or less fallen in love with a charming young German girl on his way. He had not been long in his parents' house before he fell desperately in love with a girl who was the daughter of one of the foremen, and was then of the ripe age of ten. Her age and her social position were both unfavourable to an immediate declaration of his passion, even in a household the head of which professed to be guided so little by the ordinary social conventions. Mr. Owen, however, who descants with much enthusiasm upon the charms of the very youthful object of his affections, contrived a plan which reminds him of the author of Sandford and Merton. Day, as is well known, educated a wife for himself with very indifferent success. Mr. Owen, with more judgment, per-suaded his sister to adopt Jessie—that was the young lady's name— and bring her up in the family. As she grew, Mr. Owen's passion strengthened. He went to America, but he never forget Jessie, who had stuyed in Scotland. Two years afterwards he returned, as devoted as ever, and resolved to make his mother a confidante of his passion. In compliance with her entreaties, Jessie being still only fifteen or sixteen, he promised to wait for three years before making an avowal. With great difficulty he refrained from saying anything to his beloved, even during a certain walk through the woods, when, as appeared from a subsequent confession, Jessio would have accepted him had he taken courage. His promise to would have accepted him had no taken courage. His promise to his mother, however, restrained him; and he returned to America for his three years of probation. The story, which is very pleasantly told, ought obviously to end by a statement that after the three years he gained the reward of his prolonged fidelity. But Mr. Owen's writing a biography and not a novel, and therefore has to make the confession that Jessie, during the three years, married somebody else and, so far as appears, lived very happily aver afterwards. He saw her once during her married life, and He saw her once during her married ever afterwards. she made to him the confession already noticed, and told him that they had better break off all communication for the future. The proposal was accepted, and Mr. Owen does not know at the present time whether she is dead or alive. He is obliged to content himself by adding an anecdote of a young gentleman in Ireland who fell in love with his nurse, eighteen years older than himself, and when he came of age insisted upon marrying her, and forced the consent of his parents by nearly dying of a

In the course of his early life Mr. Owen became acquainted with various distinguished people, and has a few characteristic anecdotes. He saw Lafayette shortly before the Revolution of 1830, and received from him some curious atories about Washington. He made acquaintance with George Combe, with L. E. L., and with other minor celebrities. Perhaps his most interesting passage is an account of a dinner with Bentham; and we will conclude by an account of w differ with reintham; and we will conclude by quoting the characteristic blessing with which the old philosopher dismissed him. "God bless you," said the venerable thinker—he was then nearly eighty—"if there be such a being; and, at all events, my young friend, take care of yourself."

GETKIE'S GREAT ICE AGE. (Second Notice.)

THE correlation of evidences yielded by the geological investigation of the British Isles, Standinavia, North Russia, and North America, tends to place it beyond doubt the climatic conditions and the superficial aspect of those countries. whether simultaneously or not, were at a remote period identical with those presented by Greenland in our day. Switzerland, in some degree similar to them in respect of its abiding glacier system, has ceased to present a precise parallel, the glacial sheet having so shrunk as no longer to cover the level plains. Further proofs indicate a succession or alternation of climates with their accommunity applications of the succession of the succe indicate a succession or alternation of climates with their accompanying geological changes. A milder temperature followed upon the extreme cold of the first and greatest Ice age. The glaciers retreated. From the melting ice masses, or mers de glace, large rivers flowed downwards to the sea, eroding and denuding the rocks and depositing river gravel and diluvium, which, as the climate became warmer, were interspersed with remains of animals which made their way northward from temperate and oven sub-tropical zones—the elephant, rhinoceros, and hippopotamus among them. A wide land surface, Mr. Geikie maintains, thickly overspread with forest, is proved to have existed by the deposits of Great Britain and their fossil contents, although in Scotland the only animal remains discovered have been those of Scotland the only animal remains discovered have been those of water-rats and frogs. The freshwater beds of this period, he bids us at the same time remember, were at a later date submerged and remodelled by the action of the sea. It is a mistake, he urges, to maintain that no remains of the old land surface in England prior to such submergence still exist, or that there are no England prior to such submergence still exist, or that there are no English river gravels that can be correlated with the lightie beds of Switzerland. Nor are the "middle sands" of Lancashire, as has been generally believed, the only representatives we have in England of the first pre-glacial epoch. On the contrary our author brings forward manifold proofs that glacial or river gravels of that age do exist, and that they have been erroneously referred to post-glucial times. In a note of great value he accumulates proofs to the same effect from the river deposits of Switzerland and Piedmont, which have had the benefit of the judicious criticism of Signor Gastaldi. What gives the problem its great importance is its bearing upon the antiquity of man, with which we are here brought free to face. It is in these deposits which we are here brought face to face. It is in these deposits that the earliest traces of man have been detected; and the question is whether, as has been generally believed by geologists, including Sir C. Lyell, these deposits are of post-glacial date. That they are not of this later date, but that they are the property of the post-glacial date. co-existence of man with the earliest or at least the intermediate stages of the great Ice age, is the main thesis of Mr. Geikie's work.

A broad gap has been established by archeologists between the

implements or weapons of the first and second Stone ages. Not only do the works of the first-or pale olithic series differ from those of the neolithic period in point of finish or polish, but they are found in positions and at heights where those of neolithic make are never met with. Investigations of caves such as Kent's Cavern, near Torquay, have shown the existence of deposits in successive layers. Under blocks of fallen limestone, sometimes comented together by stalagmite from the percolation of water holding carbonate of lime in solution, we come upon a thin layer of mould, and then upon stalagmite from one foot to five feet in thickness yielding remains of sub-tropical animals and a human jaw, below which is red cave-earth, five feet thick in parts, with more animal bones and neolithic implements. Beneath this is a floor of stalagmite in some places twelve feet thick, with bones of the cave-bear, and under it a bed of breccia and red loam, with remains of the cave-bear and implements of the palseolithic age. What time must we conceive to have elapsed during the deposition of this lowest stratum, and by what interval is it separated from the later age marked by works of the neolithic series? Certain remains of the Romano-British age have been found in the same cave covered with stalagmite nowhere exceeding six inches, this amount representing a lapse of nearly two thousand years. How long palmolithic man occupied these caves ere he left his final traces we cannot tell, but after these untold ages he disappeared for ever, and with him vanished many animals now locally, if not wholly, extinct. At all events, no gradual passage, but a break sharp and abrupt, however vast the interval of time it represents, is seen between the neolithic deposits and the underlying palæolithic accumulations.

A convergent series of proofs is supplied by certain river deposits, on which Mr. Geikie lays much stress. By the aid of a diagram from Sir John Lubbock's Pro-Historic Times, he makes clear the difference of level at which sundry of our present rivers and other streams now scarcely represented flowed in remote ages, as shown by the shelves or terraces of gravel and learn which denote successive levels of crosion. At heights far above the existing river bed are found among these deposits flint implements always of the palmelithic series, betokening the time when man lived at this height above the existing river level. The Thames during the real malmelithic age had time to except the relief of the palmelithic age had time to except the relief of the palmelithic age had time to except the relief of the palmelithic age had time to except the relief of the palmelithic age had time to except the relief of the palmelithic age had time to except the relief of the palmelithic age had time to except the relief of the palmelithic age had time to except the relief of the palmelithic age had the palmelithic age to the palmelithic age to the palmelithic age. paleolithic age had time to excavate its valley to a breadth of four miles and a depth of not less than a hundred feat. When paleolithic man lived in the South of England, the Isle of Wight formed part of the mainland, a range of chalk downs, at least six hundred feet in height, running east from the Isle of

^{*} The Great Ice Age, and its Relation to the Antiquity of Man. By James Geikle, F.R.S.E., F.G.S., of H.M. Geological Survey of Scotland. London: Ishister & Co. 1874.

Purbook, and joining on to the Needles. The bed of the present Solent was filled by a large river, in which the rivers that now traverse Dorset united with the Avon and the Stour, Southampton traverse Dorset united with the Avon and the Stour, Southampton Water forming another affluent of the same great stream. The gravel hed of this ancient river is now found capping the cliffs of the mainland at heights ranging from fifty to one hundred and thirty feet above the level of the sea. A vast period must have intervened see these rivers cut their way down to the present level, prior to which palseolithic man disappeared, a wide blank or histus separating his age from that of his neclithic successor. No less marked than the successive types of men pointed out by the study of these caves and gravels are the groups of animals yielded by the respective deposits. Three great divisions or groups of mammalian remains have been recognized in the drift, representing flouthern. Arctic, and Temperate anacies, and pointing to

enting Southern, Arctic, and Temperate species, and pointing to senting Southern, Arctic, and Temperate species, and pointing to climatic conditions corresponding to as many zones of temperature. That changes of an extreme kind must have taken place in the climate of these islands would appear to be an irresistible conclusion. For that species so diverse could have lived side by side together is beyond our powers of conception. In the first, or sub-tropical group, we find the lion, the tiger, the spotted hymna, two extinct species of elephant and two of rhinoceros, an extinct tiger, Felis and the hinocontamus. In the second, or Northern group. coffer, and the hippoptamus. In the second, or Northern group, occur the glutton, the reindeer, the musk-sheep, the pouched marmot, the Alpine hare, the lemming, the extinct mammoth, and woolly rhinoceros. The third, or temperate group, comprises the woonly rainoceros. The third, or temperate group, comprises the bison, the great urus, the grizzly bear, the now extinct cavebear and Irish elk, with the lynx, wild boar, wild cat, and beaver. The paleolithic deposit also yields remains of the panther, wolf, and fox—animals which bear more extreme vicissitudes of climate. How then are we to account for the presence in our islands of the denizens of such widely varying climes? The theory of strongly contrasted summers and winters during which extreme migrations of the fauna of Northern and Southern comes took place into Bestain joined as it workship upon at the time which extreme migrations of the fauna of Northern and Southern zones took place into Britain, joined as it probably was at the time to the Continent, is set aside by Mr. Geikie, although supported by the fact of the large annual migrations which are known to occur in Siboria and North America. With glaciers filling the mountain gorges in Scotland, the North of England, and Wales, and frost binding our rivers a great part of the year, could the hippopotamus find waters warm enough or fare of a sort and quantity to his liking? Could he brave the clames even if protected as some have conjectured like the rhippoporagual was today. tected, as some have conjectured, like the rhinoceros and mastodon, with a coat of hair or wool? To be sure large glaciers still exist in the Alps, and much greater ones fill the upper valleys of the Himalayas, yet the low grounds at their bases enjoy warm and genial climates. Such differences, however, exist between the geographical conditions of our country and each of those regions as to render nugatory any inference to be drawn from these con-

The difficulty is indeed one of the most arduous within the whole range of geological research, and it is not strange that Mr. Geikie's treatment of it leaves it still enveloped in doubt. He has indeed not a little encumbered himself by the assumption that no change of any consequence has taken place in the distribution of land and water, and in the consequent et or flow of oceanic and aerial currents within the period of Ice age. The view relied on by Sir Charles Lyell and the school represented by him, that alternate groupings of land around the equator and the poles have been the chief cause of such extreme changes of climate, is set aside by him as both unsupported by evidence and inadequate in itself to explain the phenomena in question. He does indeed recognize the influence of the equatorial set from the Atlantic known as the full Stream in witigating set from the Atlantic, known as the Gulf Stream, in mitigating the climate of these islands. But then this influence was, he holds, equally at work during the whole period of these mighty changes. Nor does he consider that much difference would be made by changes such as that of the Mediterranean forming dry land or (we may infer) Northern and mid Africa being under water. His speculations on the existing isotheral and isochimenal lines of Europe and Asia, connected with what he conjectures to have been the climatic conditions of former ages, lead him to the hypothesis of causes wholly beyond those of a geographical kind, exterior indeed to the earth itself. It is on the eccentricity of the earth's orbit, combined with the precession of the equinoxes, that Mr. Geikie eventually rests for the solution of the problem. Putting forward as he does the "calculations of astronomers" in proof that the position of the earth relatively to the sun some two hundred thousand years ago was such as to account for the Arctic state of the Northern hemisphere at large, we should have been glad to know Northern hemisphere at large, we should have been glad to know what names eminent in astronomy have been appended to the hypothesis of Mr. Croll. We might further ask what proofs beyond the weight of their names the "eminent physicists and geographers" elsewhere spoken of have to adduce for the theory which forms part of the scheme of Mr. Geikie and Mr. Croll, that the great constant currents of the ocean, extending as they do in cases to four or five thousand miles in length, many hundreds of miles in width, and four or five miles in depth, are set in motion at the rate of four or five miles an hour all the year round by the trade winds rasping their surface for sefew months in the year. That these currents, whether stirred by these periodical winds or by the direct action of solar heat. comthese periodical winds or by the direct action of solar heat, combined with the earth's rotation, have had a great deal to do with the climatic changes of our hemisphere, we are as much contained as Mr. Geikie can be. The question is, whether they have

not had all or nearly all to do with them. Let us take the hemisphere as it exists now. In Greenland, our author has shown, we have befere our eyes a counterpart of what Scotland, if not all England, was like according to the views of extreme glacialists. The southern point of Greenland comes down well within a degree of the latitude of the northern point of Scotland. What is needed to render possible the extension of the les sheet, already coming down thus far, a few degrees further? Were not Greenland abruptly bounded by the sea, where could we pretend to limit its possible extension? And were but the configuration of our own seaboard other than it is—the Atlantic current away, and prevalent Polar winds taking its place, land communication of our own seanoard other than it is—the Atlantic courrent away, and prevalent Polar winds taking its place, land coming down from the Pole to join our Northern region with Scandinavia—might not climatic effects ensue greater far than those due to any hypothetical change of three or four degrees in the inclination of the earth's axis, or to any extra freezing in aphelion winters? For alternations of temperature as extreme as any implied in the presence of Aprils and aphenic faunc within any implied in the presence of Arctic and subtropic fauna within periods by no means remote, if not within the compass of an annual migration, we need look no further than to the United States of our day. The temperature of New York varies within the year to our day. The temperature of New York varies within the year to the full extent of 120°. It is not the degree of sunshine dependent upon latitude—which it shares with Naples—that causes this alternation of polar winters and equatorial summers; but the configuration of the earth at that particular zone, and the serial currents which bring to it the accumulated climatic influences of the great centres or magazines of heat and cold. The British Isles, also occupying a mid position between these great generators of climate, doubtless owe to similar causes their present exemption from either extreme. There need at all events be no calling in of astronomical or cosmical revolutions to explain such phenomena as may be simply due to elevations or depressions which may not have amounted to many thousand feet, yet altering extensively the geo-graphical area above the sea, and involving a corresponding change of direction in the warm oceanic and aerial currents. It must anyhow remain doubtful how far any calculations based upon the maximum ellipticity of the earth's orbit bringing round extreme maximum ellipticity of the earth's orbit bringing round extreme Arctic conditions of our hemisphere in periods of 170,000, 260,000, and 160,000 years or the like can throw light upon the dates of the Glacial and Inter-glacial ages, and by inference upon the antiquity of man as a witness of these mighty changes—a fact set beyond much doubt by the human fibula found of late under the glacial clay of the Victoria Cave at Settle. It is at present, as Mr. Geikie himself would concede, premature to dogmatize upon a subject so new, so complex, and so little capable of direct and positive proof as the origin. the date, or the full extent of the glaciative proof as the origin, the date, or the full extent of the glaciation of our hemisphore. He has, however, done good and permanent service in bringing together the latest and most authentic evidence bearing upon it, and his book will mark an epoch in the scientific study of the Ice age.

A CHRONICLE OF THE FERMORS.*

MR. ROGERS the poet, being questioned by a lady on the subject of several new books then lately published, professed his ignorance of their contents and quality. "Why, Mr. Rogers," said the lady, "you seem never to read any new books"; to which he made answer, "No, whenever a new book comes out I read an A reader who adopted such a method nowadays would become very well acquainted with the standard literature of his country; he would also have the advantage of being able on occasions to acquire a certain knowledge of an old book by reading it in the disguise of a new one. Whether he would not do more wisely in going straight to the original is another question. It wisely in going straight to the original is another question. It seems, however, that some writers, acting possibly on the poet's hins, have discovered an ingenious method of saving themselves, if not their readers, some trouble by going to an old book when they want to write a new one; a method which argues a laudable modesty and absence of overwhelming confidence in their own powers, but has little else to recommend it. It may be said also with some show of justice to look more like the pride that apes humility than true modesty, which should rather lead them to the belief that the old book is worth reading in its integrity and originality than to the notion that it can be bettered by their skill in dressing it up for modern taste. A little while ago we had occasion to speak of such an attempt to improve Boswell's had occasion to speak of such an attempt to improve Boswell's Johnson, and here we have another specimen of the same class. Mr. Mahony has taken a set of incidents out of Horace Walpole's letters which are the main source of his inspiration, although he does not disdain to refer also to Mrs. Delany and other writers of the same time, and has strung them together with threads of dialogue, narrative, and reflection on his own part so as to make them into a kind of romance. He has in doing this reversed the usual attributes of a romance-writer, whose privilege it should be to make the creations of his mind seem like real living beings; there the author has made people who were real and living seem the creatures of invention. In proposing to himself the task of representing in a fiction founded on fact such personages as Horace Walpole, the Duke of Newcastle, Lord Lincoln, and many others whose names are to be found in Walpole's letters, the author underwhole in the proposition of a work took something far more difficult than the writing of a work

entirely inventive, although at first sight it may seem more easy. He has to contend with the difficulties of knowledge, tradition, and preconceived ideas on the part of his readers—difficulties so great that even the skill and power of Thackeray, in whose footsteps it easy to see that Mr. Mahony hopes to follow, did not always avail to overcome them. He had not the hardihood to encounter them face to face, as the chronicler of the Fermors has done; the interest in Emond and The Virginians centred in the fictitious, not the historical, characters. Thackeray, too, had the spirit and the style of the period which he described at his fingers' ends; and it may be safely asserted that, had he taken upon himself to describe a conversation between Lady Pomfret and George Selwyn before dinner at Easton Neston, Lord Pomfret's place in the country, he would not have put so thoroughly modern a word as "esthetic"

Into Lady Pomfret's mouth.

The story which Mr. Mahony has strung tegether out of Horace Walpole's letters is not of a sufficiently exciting character in itself to afford any valid reason for its reproduction in such a form. It is merely the history of Lady Pomfret's desires and efforts to sccure for her daughter, Lady Sophia Fermon, an alliance with Lord Linceln, with the prospect of becoming Duchess of Newcastle, her failure to carry out this praiseworthy intention, and a brief summary of what befel the various persons of the story afterwards. It is such a story as may be made interesting by force of a writer's knowledge of character and eleverness in fitting ordinary incidents together as the pieces of a map are fitted; wanting the adjuncts with which such a writer might clothe its outline, it appears here and poverty-stricken. There is a want of energy in the progress of the story, a want of life in the characters. Lord Lincoln, for instance, one of the chief movers of events, was, according to the chronicler's account of him, a young gentleman of marvellous inconsistency. He is described as he pays his farewell visit to Lady Pomfret, when, suddenly recalled from Florence by his uncle the Duke, he leaves the place without saying anything to justify the brilliant hopes which the lady has entertained of becoming his mother-in-law. He is hoping for an interview with Lady Sophia, and a chance of expressing grief at the necessity for his sudden departure, when Lady Pomfret enters the room in the place of her expected daughter. "Lord! how frightened the man looked, how mean! the Countess thought. . . . The Countess wondered how she could have ever thought him agreeable or handsome; he had not even the bel air, as he stood cringing behind the drawing-room table, furshling at his hat." A few minutes later, as this crigal, bearing." Nor is his subsequent conduct as described any more lifelike than this; it is difficult to discover in him anything of that clever agreeable disposition which captivated Lady Sophia's he

At the funeral of the king he was so overcome that he burst into floods of tears, and rushed many times down into the vault, tearing himself away from a last look at the remains of the sainted monarch whose spirit was already (according to the poet-bishop, good Dr. Porteus, quoted by Thackeray) in heaven:—

"No further blessing could on earth be given— The next degree of happiness was—heaven!"

The next degree of happiness was—heaven!"

There were a crowd of persons standing by, witnesses of the heartrending seeze, amongst these Horace Walpole. Who has not looked at the picture of that comedy exhibited by him? The burlesque Duke falling into a sit of tears at the moment of entering the chapel, then, in a spasm of grief, he dings himself into a stall sobbing aloud, the Archbishop hovering over him with a smelling-bottle, all thecircle of tearful eyes looking on at the exhibition. Then in two minutes," adds Walpole, "his curiosity got the better of his hypoerisy, and he ran about the chapel with his glass to spy who was or was not there, spying with one hand and mopping his eyes with the other. Then returned the fear of catching cold, and the Duke of Cumberland, who was sinking with heat, felt himself weighed down, and turning round found it was the Duke of Newcastle standing upon his train to avoid the chill of the snarble.

Mr. Mahony takes the opportunity afforded by the extravagant encomiums published of the Duke after his death by the papers of that time to launch out into a virtuous tirade against the hypocrisy of such praises in general. The peroration with which this is concluded is a good instance of that attempt to imitate Thackeray's style which has been spoken of above:—

It only requires an ignorant or a service House to make an excellent "heaven-born minister" at any time; one in whose person arrogance and self-righteousness are secred attributes, whose virtues stand arranged peepshow haliben, to be gazed at by the would only through a magnifying glass, that what matter? Were all England to have a pocket-handkerchief to its mose this moment, blubboring over the loss of such a one, lauventing as it doubtless would through the columns of its broadshoes—what then? Do you suppose our children will not discover the chart, and poke out the truth, and set the sham up usked in the pillory of history, stript of its tawdry rags, for all the columns of windy adulation, the leaded type, and mourning bands of the peany papers?

It speaks well for Mr. Mahony's judgment that he should select so marked a writer of English to model his style on, whatever may be thought so to the success of his experiment. As a zule, when one

finds an artist fashioning his productions after the manner of some acknowledged master, it is natural to presume a better acquaintance on his part with that master's works than belongs to the work in general. Mr. Mahony, however, appears to have but little knowledge of Thackersy's books, for at the very beginning of the Chronicle of the Fermors he speaks of Lieutenant Osborne "suffering an unexpected blight of his budding affections, as we read in the famous history of Vanity Fair." Any one who has read and remembered to a moderate extent Vanity Fair will know that Lieutenant Osborne never did suffer such a blight; that, on the contrary, Amelia Sedley evinced a constancy to him which he may be thought to have hardly merited. But this is not all. The writer of the book before us goes on to describe how under these imaginary circumstances Lieutenant Osborne "encountered an unhappy boy whipping his top on the flags in his way, and smarting under the recent wound, that spirited young officer relieved his agony by magnificently kicking the unchin's plaything into the adjacent area." As a master of fact this incident occurs in Pendennis, and the kicking swey of the top is the only action by which Sir Derby Oaks is distinguished in that history. It may be unjust to accuse Mr. Mahony of ignerance or want of memory on these grounds; possibly he has carried his idea of improving old books so far as to thisk that the value of Pendennis and Vanity Fair would be enhanced by their being judiciously mixed. On the other hand, this strange mistake may be due to mere carelessness, which one is apt to think the more likely on finding in the same chapter with it a seatones so remarkably constructed as this:—"The greatest people at Court, the king himself, was on the list of her admirers." Perhaps this startling departure from ordinary rules of grammar may be explained by the author's respect for the King having led him to include all the greatest people at Court in the august person of Flis Majesty; but then he ought to have spel

Hitherto we have spoken of A Chronicle of the Formers by its first title only. Its second one, "Horace Walpols in Love," strikes us as indicating the only pure and unadulterated piece of invention to be found in the book. The notion that the brilliant, clever, cold Horace Walpole could be in love is sufficiently startling, enough so to make its announcement as a fact an attractive title for a book. It would be a very pardonable curiosity which led a man to refer to the book in order to find out what which led a man to refer to the mook in order to find our what grounds existed for so unexpected a statement; if, however, he thought to find in this book any soled grounds upon which to build up a romanico in Horace Walpole's life, he would probably be disappointed. The writer, however, deserves some credit for the ingenious manner in which he has constructed a cost of ideal with Homaca Walpole as its control forms. structed a sort of idyl with Horace Walpole as its central figure —a Watteau shepherd, as it were, with an eye-glass—out of materials which hardly promise well for such a purpose. He begins by stating as an undisputed fact that Walpole was an early victim to the charms of Lady Sophia Fermor, and that he made no kind of secret of his admiration or of his feelings towards her. If this be so, it is strange that it should have been reserved for the writer of A Chronicle of the Fermors to discover a fact which was so patent. He goes on to say that Walpole quickly perceived the maternal hopes which Lord Lincoln's arrival at Florence had excited in Lady Poinfret, and that "his sentences are never so pointed as when elaborately dwelling upon them; he delights in ridiculing the Countess in every way, in exhibiting her absurdity and her intrigues." One would think that a man, however much disposed by nature and habit to satire, would be likely rather to spare the mother of the girl with whom he was seriously in love than to select her as the special butt for the shafts of his ridicule; than to select her as the special butt for the shafts of his ridicule; this, however, is merely matter of conjecture. There is some foundation apparently for the theory that Walpole did love one of the Ladies Fermor, in spite of his contempt for their mother; for the writer goes on to say, "Mr. Warburton, it is true, affirms that Lady Charlotte Fermor, the younger sister, was the object of his passion, but no student of his letters can doubt that it was Lady Sophia alone." It is a natural redection that Mr. Warburton and the content of the second content of the seco would be as well qualified to judge of such a matter as any one, but he had not the advantage possessed by Mr. Mahony of bringing to the study of the letters a mind unprejudiced by any near knowledge of the facts. Lot us see what is the evidence which is produced by the creator of this theory in its support. He gives a description of a juvenile ball given by Sir Thomas Robinson of Rokeby in honour of a young daughter of the Duke of Richmond. And in the course of this description Mr. Mahony falls into another singular error by making Walpole relate as Selwyn's a bon mot which is quoted as Hotham's in letter (to George Montagu, May 12, 1752) whence Mr. Mahony must have extracted it. Mr. Walpole is at the ball, and so is Lady Pomfret, and they engage in a kind of duel of words in which she is worsted with an ease which does but little credit to so celebrated a wit as Walpole. Here, again, occurs a singular instance of the writer's attempt to reproduce Thackeray's style:-

He [Walpole] was no longer the Peri casting longing eyes into that Paradise where he dared not set foot. He did not covet Paradise any longer, not he; and as for the angel guarding the garden of Eden with the two-edged sword, her wit—faugh! he laughed at the bless and harmens weapon, as at this poor old raddled angel with her mach Italian and her "malheropse" Franch.

The practice of spelling French as it is supposed to be pronounced by English people seems always to be segurded as a sufmeans of entertaining the reading public; has some as assured a fund of humour as this may be drawn upon too heavily. It is difficult, for enample, to see what is the difference in promunciation between the French "tout ensemble" and the "tout ensemble" which is put by the writer into Lady Pumint's mouth. But to return to Hennes Walpole and his supposed unlucky passion. He is represented as attempting, with but indifferent success, to appear unconcerned and indifferent in the presence of Lady Sophia; as being reclard with jealousy of Lord Holderness; as asking Lady Sophia to dence, meeting with a refusal on the score of her fatigue, and seeing her the pert moment stand up with Lord Holderness. being sucked with jealousy of Lord Holderness; as asking Lady Slophis to dence, meeting with a refusal on the score of her fatigue, and seeing her the next moment stand up with Lord Holderness. Then we are told that he left the house, and turned into White's for a game of leacent, and, going at last back to his rooms, set down to finish a letter to Mann, but could write only on one subject. How far does that part of the letter quoted by Mr. Mahony go in support of this elaborate story? The italics are Mr. Mahony's:—

"There were many great beauties," he writes. "Lady Emily Lennex, Lady Euston, Lady Comilla Bennet, and Lady Sophia Fernor, hand-somer than all, but a little out of humour at the scarcity of minuels: however, as usual, she danced more than any other lady, and as usual too, took out what men she liked, or thought the heat dancers. Lord Holdern as to a little what Lord Lincoln will be to-morrow, for he is expected. The supper was served at twelve: a large table for the lady dancers; their partners and other ladies stood around. We danced till four, then had tea and coffee, and came home. Finis Balli."

On the face of the letter it seems that Walpole did not leave

On the face of the letter it seems that Walpole did not leave the ball before the rest of the company, for he chronicles its end. But then Mr. Mahony is privileged to rend between the lines, and to tell us that "it will be seen that Walpole did not faithfully chronicle all his impressions that evening, nor accurately narrate the facts as they concerned himself." That is, with a singular want of foresight, he did not chronicle the impressions which Mr. Mahong has there he do not chronicle the impressions which Mr. Mahong has the walt fit to account to him pressions. which Mr. Mahony has thought fit to assign to him years after-wards, or he did not see, as Mr. Mahony does, precisely how the facts wards, or he did not see, as Mr. Mehony does, precisely how the facts affected himself. Then the writer, who scenes to have mysterious but certain sources of information, tells us that it was far on into daylight when Walpole finished his letter, and that he looked at his white face in the glass with a shudder. It is tolerably fair to imagine, or even to assert, that Walpole, who was never a person of a brilliant complexion, had a white face at four o'clock in the morning, e-pecially after a ball; but one would hardly expect him to shudder at seeing it reflected in the glass. Still less likely was he to give way to such reflections as these:—"What an object he was! But who was to blame? Had he not wantonly brought it on himself? If he had been silve enough to come back again flickering round the old flame, then he had singed himself for his pains and had only his fally to thank had singed himself for his pains, and had only his folly to thank for it." Mr. Mahony, however, gives us to understand that this was the tenor of his thoughts, and Mr. Mahony perhaps knows was the tenor of his thoughts, and Mr. Maliony perhaps knows best. With such elaborate workings up of selected passages in Walpole's letters, eked out with quotations from Lady Mary Montagu and others, great part of the Chronicle of the Fermors is taken up. Minor characters are introduced here and there to lighten the story, with no signal success. There is a Captain Keats who comes down to stay with Lord Lincoln at Esher, in whom who comes down to stay with Lord Lincoln at Esher, in whom there is a perceptible flavour of Thackerey's Viscount Cinquers in the Shabby-Genteel Story; a young man who belongs to a racketing set in town, who brings down tales of wild parties at Vauxhall which were "the joilivat parties," and of girls who are "very jolly girls." This is about as surprising as if a young guardsman of the present day should "protest" that the last comic opera "was vastly entertaining, egad!" or great his hostess at a party with "Pray, madam, was you at Ranelagh last night?" Then there is Lord Lempster, Lady Sophia's brother, a drupken set whose humour seems to lie in the fact that a drunken sot whose humour seems to lie in the fact that he is afflicted with a lisp; and there is Alphonse; Lord Lincoln's French valet, who is nearly pinked by Lempster in a drunken freak, and presented with a fine diamond by Lady Pomfret to hush it up; and there are a set of servants who talk of their masters as "governors," just for all the world as servants are supposed to do nowadays. Among all these people, and amid the supposed to do nowadays. Among all these people, and amid the wavering resolutions of Lord Lincoln, who is always making up his mind to jilt his cousin Catherine Pelham, and propos Lady Sophia, and always unmaking it again, one rather loses sight of Horace Walpole and the theory of his love after the early part of the book. It would probably be quite easy to construct an entirely different theory as to the workings of Walpole's mind by selecting with due care and skill a different set of passages in the letters to be marked with italics and strong together into a consecutive after: it would also be quite medicas secutive story; it would also be quite useless.

LATIN LETTER-WRITERS.

CICERO'S Letters are excellent reading both as a model of style and as a psychological study; and the wonder is that achoologys are not more generally made to read them and even learn them by rote, both by way of facilitating the spistulary task which is generally hateful to them, and in order to teach them the virtue of straightforwardness by examples of its opposits.

The Letters of Cicero to Atticus. Book I. Edited by Alfred Pretor, M.A., Fellow of St. Catherine's College, Cambridge. Cambridge: Deighton M.Bell. London: Bell & Daldy. 1873.

Selected Letters of Cicero and Pliny: with Notes for the Use of Schools. I vols. By the late Constantine E. Prichard, M.A., formerly Pellow of Balliel, and Edward R. Bernard, M.A., Fellow of Raginien College, Oxford., Carbod: Clarendon Press. 1872.

Pluny the Younger tan, through somewhat of a points as milksop, displays so micely the graces of a less natural style, better heart, and a more thorough gentlementy feeling them Giorge and is withal so valuable as a electric of miciety at a much late period of Rome's history, that he deserves to be in the hands a boys and men as the second light of Latin epistology literature poys and men as the second light of Latin epistolary literature. Beside these two there is no other; for we regard Seneca as a letter-writer only in form, his real scope being presching ar didactician. didacticism.

We rejoice to find that both our Universities are bestirring themselves to revive the study of Olocro and Pliny as letter-writers. The larger volume of Select Letters edited by Mr. writers. The larger volume of Select Letters edited by Mr. Albert Watson for the Chrenden Press is followed up at Oxford by the handier volumes of Messes. Prichard and Bornard; whilst at Cambridge Mr. Alfred Protor, the author of a very meritorious little edition of Pennius which we noticed at the time. of its appearance, has seconded the scholarly solections of Clience's Letters put forth some three years back by Mr. Holmes of Clience, and has given us in a compendious form a capital text and commentary of the first book of the Letters to Attious. Mr. Protection plan and mode of carrying it out are so much more to our tenthan the more purely schoolroom editions of Prichard as Bernard, he deals so much more thoroughly and independs with difficulties of text and interpretation, and someour takes to our thinking, so much truer a measure of the great letter writer both in the commentary and in the preliminary of character, that our present remarks will be confined for the most part to the Cambridge volume. Yet we do not heaitste to may that the editions of the two Oxford scholars will serve a useful, matterof-fact purpose, if they fall into the hands of young students. They strike us rather as deficient in genius, acumen, and tudepender judgment, then as failing to afford needful information or some

and helpful interpretation.

There was probably never a letter-writer who mane complete. than Cicero sat down and poured out his inmost thoughts to his correspondent, and this is especially true as regards his determ to Attieus. Given a friend of a like mind, as Attieus was, both for better and for worse, both in literary tastes and in the worship of a trinning and time-serving policy, there could be no one to match Cicero in telling out his heart to his, as a history with when to use his own words. the worsing of a trimining and trimeserving passey, there could be no one to match Cicero in telling out his heart to him, as to one with whom—to use his own words—"ego collequar, hih? fingam, nihil dissimulem, nihil obtagam." As we unrawel the tangled web of selfishness and tortnous policy, our difficulty does not lie in finding suppressions or reservations of the truth, hownot he in finding suppressions or reservations of the truth, however damaging to the writer's aprightness may have been its fractal and undisquised confession. It is rather that we can searnely believe he is in earnest, or is seriously committing to paper thoughts at which, if that paper (to use Cicero's phrase) example that, his correspondent could not help doing so, were he not already case-hardened. The drawback to a boy's initiation in Cicero's Letters might indeed be that, in the admiration of his invitable many and continuing attle he would format on the Letters might indeed be that, in the admiration of his im-imitably easy and captivating style, he would forget or con-duce the grave faults of the man—his selfishness, his time-serving, his unscriptions justification of any shift, any amount of tergiver-sation, if only it would subserve the eads of his diplomacy. Luckily, in Mr. Pretor's edition this dawwhack is obvioted by the wholesome animus of the commentator, who, siding with the minority of scholars in deprecating Ciscro's selfishest ends, and doubting his patriotism as well as his goodness of heart, considers it his duty to examine and compare the sentiments expressed in various parts of his epistles, and to try them by the touchstone of truth and consistency. No one can refresh his memory of these letters by the help of this edition, and not, after all allowances, regard them as "the records of a man who in his private relations was vain, selfish, and unaffectionate, and in his public life a weak and unprincipled time-server." Whilst he uses Attions as an "anisolars dummer on which are to be heart the Atticus as an "epistolary dummy on which are to be lung the trophies of his political and public life," there are in his letters no sufficient traits of private affection, home kindness, or staunchness to his friends to redeem or counterbalance the damage to his ness to his triends to reducin or counterbalance the damage to his political reputation which results from the publication of them. If him might have contemplated—so he no doubt did—the publishing of his collected letters; last Cicero, unless indeed he really believed that "want of principle and a low standard of right" were things to be proud of, must have reposed in the confidence that he and Atticus were "arcades unbo," and that his tricks and shuffling would go no further than the correspondent for whose propositive over their ways assumance that or purpose the head. appreciative eye they were commemorated on paper. we know, to avoid extremes in arguing for or against Cicero; and accordingly checks ought to be put upon undue partisanship. Still, looking only at the first book of the opistles to Attions, which is now before us, Cicero, were he to be judged out of his own mouth, must be found guilty of low and selfish motives of conduct.

How atterly he could, for his own interests, condone the worst profligacy and fraternize with the most worthless and visious of men, is seen where, in the very next letter to that in which he says that Cettiine will seek the consulship if the judges can bring themsolves by acquitting him to declare that the sun does not shine at solves by acquitting him to declare that the sun does not shine at moon, he announces to his correspondent that he is going to defend this very Catiline, because he must be cultivated for election purposes (I. ii. § 1). As Mr. Pretor shows, it matters little whother he actually did defend Catiline. It is letters show that he was ready to do so, and was propared to use underhand tactics as to the challenging of the judges, for the sake of concilisting the manufacture of symmetric propagations of Catiline and his influential backers.

As argued also to the proposals in the Senate to presecute Clodies

for sacrilege, it is remarkable that in Ep. xiii. § 3, Cicero is at pains to make Atticus understand that it was not he, nor any man pains to make Atticus understand that it was not he, nor any man of consular standing, who brought the matter before the Senate. And why? "Not because he wishes to cast blame on the consulars, but because he fancies Atticus will sanction his irresolute policy in a matter the issues of which were yet so uncertain" (Pretor, p. 78, note). In this and other admissions with reference to Antonius and Crassus the low morality of the writer is pitiable, though there may be someunications, which remind one of a bank-forger writing of his communications, which remind one of a bank-forger writing to an accomplice. Mr. Pretor weighs the evidence tendered by Oicero's admirers to relieve him from the stigms of cold-bloodedness involved in the announcement of Ep. vii.:—"Pater nobis decessit a.d. viii. Kal. Decembres"; and he is inclined to decide that the writer speaks of his father's death. A filial announcement truly! The mass of friendly commentators endeavour to whitewash Oicero by resort to the testimony of dates; but Mr. Pretor shows the lengths to which special pleading will go in justification of a hero or an ideal, when he quotes Billerbeck's brief comment on the reading "decessit," "The shortness of the notice shows how deeply Oicero felt his loss." The friendly commentator forgets to read on to the next sentence, wherein the bereaved orphan applies himself to the everlasting reiteration of his commissions for statuary to grace his library and his training-school. In other cases there might be pleaded on Cicero's behalf the display of more genuine feeling; but there is no instance that we know of so really touching as I'liny's letter on the death of Fundanius's daughter on the eve of her marriage (I'lin. death of Fundanius's daughter on the eve of her marriage (Pline v. 16, Ep. 49, Prichard and Bernard); and we must agree with Mr. Pretor that Cicero's expression of regret at the death of his reader Sositheus, "a pleasant lad, whose death has distressed me more than a slave's death should" (xii. § 4), is "greatly spoilt by the allusion to his own condescension," and is no match for Martial's epigram on Erotion's death (v. 37). Readers of Messrs. Prichard and Bernard's selections from Pliny's Letters will find how much success and finer was that writer's tone of feeling and affection for and Bernard's selections from Pliny's Letters will find how much nicer and finer was that writer's tone of feeling and affection for his slaves; but then Pliny was a gentleman. After all, however, as bad a count as any against Cicero consists in his cool treatment of the wishes and interests of his bosom friend. In the first letter he gives the cold shoulder to Atticus's uncle Cascilius, because to take up his case against Satrius would damage him (Cicero) with Domitius. In the eleventh, and indeed in others, he exhibits a strange indifference as to the reconciliation of Atticus and Lucceius, which he had undertaken to bring about, and which Atticus had greatly at heart. It is the same in Ep. xvii. with regard to the misunderstanding between Atticus and Quintus Cicero. Cicero might have reconciled them, but his friendships never stood in the way of his interests. In this epistle Messrs. Prichard and Bernard see a genuine tribute to the tried friendship of Atticus, and no doubt the 6th section, taken by itself, looks like a warm expression of feeling. But, as Mr. Pretor points out, section 7 does away with the whole value of this, by showing that it is simply an official compliance with Atticus's request that that it is simply an official compliance with Atticus's request that he would set his motives straight, beyond the possibility of misconstruction, with the outer world. Cicero's brother had named Atticus as a "legatus" on being appointed Governor of Asia. Atticus hung fire, no doubt at the secret instance of Cicero, who Atticus hung fire, no doubt at the secret instance of Cicero, who felt that he would be isolated without so like-minded and sagacious an advisor within reach. And so the friend ran the risk of being compromised, as fickle and inconsistent, with the Roman public, and the misunderstanding with Quintus Cicero had to rankle and remain unhealed, because this pattern friend could not postpone his own solfish interests. The expressions of Ep. xvii., read with this key to them, much resemble a dictated apology.

A passage in this letter may serve to exhibit Mr. Pretor's tact in dealing with the text of the epistles, which, it need scarcely be said, is constantly doubtful, and of which the history, by the way, is exceedingly well summarized in Messrs. Prichard and Bernard's preface. Cicero is admitting to Atticus the conviction that Quintus Cicero

Cicero is admitting to Atticus the conviction that Quintus Cicero is vexed at his conduct and suspicious as to the causes of it:— "videbam, subesse nescio quid opinionis incommode sauciunque cess ejus animum et insedisse quasdam odiosas suspiciones"; and cesse is omitted in the best MSS, whilst et is not cond in others. Our Oxford editors in their note on the passage seem to omit both, though, as et appears in their text, we must conclude that they are doubtful. Mr. Pretor observes that "ease" might well be spared, but "that to leave out et with Schutz and Nobbe is to introduce a construction most unusual with Cicero"—to wit, an accusative after "insideo." That Mosers. Prichard and Bernard do not view this in the same light appears from their construing, "And that his feelings were wounded by some unpleasant suspicions which had settled in them"; though, when they come to illustrate what they settled in them"; though, when they come to intuitiate what they term a common construction, they are driven to adduce a solitary instance of it from Livy. One other example of the superiority of the Cambridge editor's judgment occurs at the end of this same epistle. Cicero writes, "Modeste rogo, quod maxime cupio, ut quam primum venias"—"I ask you respectfully, for what I desire above measure, to come as soon as possible." Mr. Pretor only notices the various reading "moleste" (i.e. "importunately"), to pronounce it less forcible and very unusual. The Oxford editors adopt and prefer it. adopt and prefer it.

Though we cannot go fully into the matter, we would refer scholars to Mr. Pretor's scute emendation of what he received as the Medicaan MS. text, "Qui magistratum simul ours lege Ælia init," in Ep. xvi. § 13. As it yielded no sense, he conjectured that east, or con for control had got copied as chem, and, adding a

final m to legs and Ækia, obtained the intelligible sentence, "Qui magistratum simul contra Legem Æliam init." This would dispose of the difficulty of separating "simul" from the ablatives which follow, and, though simul would fall rather flat, the passage would declare that Lurco was elected in contravention of the Ælian law. But, though Mr. Pretor deserves praise for his ingenuity, he has candour enough to quote a communication from Mr. Manao, which, arriving after the note was in type, removes the necessity for it. The Medicean reading is insimul cum, not simul cum, of

which, arriving after the note was in type, removes the necessity for it. The Medicean reading is insimul cum, not simul cum, of which the following is a simple, and perhaps not unestisfactory, correction; qui magistratum insimulatum lege Ælia iniit, "who entered upon a magistracy impeached by the Lex Ælia."

We may add that Mr. Pretor is especially good in explaining uncommon words, or words not used in their usual sensecy, prolixa, perhibere (in the sense of adhibere); recolligi, decidises, devenire, adlegatio, divinitus, &c.; and that he is very acute, as well as painstaking, in substantiating the propositions which he takes up; for example, where he gives his reasons for considering Teucris in xii. § I and elsewhere to be identical with Antonius. And though we cannot subscribe to his wish that we should translate "Tonollania". . . includam orationi mere," "I'll send you the topographical description of Missenum with my speech—i.e. in the same parcel with my speech," we are bound to say that his "construes" are generally very neat and accurate, and admirably calculated to help the younger student. And this is the case no less in longer passages which require nice unravelling—e.g. Ep. x. § 6—than in short sentences where the Latin contains a joke to be reproduced, or an alliteration to be imitated. Among the former is the hit at letter-carriers, "Quotus enim quisque est qui epistolam paullo graviorem ferre possit, nisi eam pellectione relevarit" (xiii. 1.), "For how few are there who carry a letter of any weight without first easing their burden by reading it through," Among the latter is the caricature of the consul who was "facie magis quam facetiis ridiculus," laughable rather from his expression than his expressions," and of the thirty-one judges "quos fames magis quam fame commoverit," with whom hunger carried the day against honour." the thirty-one judges "quos fames magis quam fama commoverit," with whom hunger carried the day against honour."

While we wish well to the selections of Messrs. Prichard and Bernard, as school-books calculated to furnish the needful amount of note and comment to the average learner, it is but right to point out that Mr. Pretor's edition of the first book of the Epistles to Atticus is something more and better than these; it is a mass of readable and interesting matter for the more advanced student, and an earnest, we hope, of a larger and completer edition of the Ciceronian Letters.

ARGUS FAIRBAIRN.

MR. JACKSON has taken a difficult theme for his plot of Argus Faubairn, and one of which the bare outlines might seem to be repulsive and unlikely. But he has managed his story with so much delicacy and pathos, he shows so much insight into human nature, and such an absence of mawkishness where the temptation to mawkishness was great, that it would be prudery to object to his theme—unfortunately one only too common in human stripped as it is of all unpleasantness and pruriency in history—strip the handling.

The character of Argus Fairbairn, poor Lois Williams's "mistake," is well conceived, and as well worked out. The sensitive and somewhat wayward boy becomes by the very law of growth and evolution the proud and passionate, tenacious and high-spirited man; implacable, unapproachable; bearing always with him the bitter sense of his mother's wrongs and his own dishonoured birth; the sorrow of his shame warping for a time all that was birth; the sorrow of his shame warping for a time all that was fine in his nature, and exaggerating his very virtues into faults. We have seldem met with a more natural presentation; it bears no trace of over-elaboration, and shows none of that false kind of consistency by which white is made as spotless as snow, while black has not even a streak of grey to relieve its dark monotony. No one can help loving the poor young fellow with his honesty and unselfishness; but no one can help being angry with him for his temper, his pride, and his unreasonableness. Our sympathy, too, naturally goes with he penitent evil-doer when he is repelled in his endeavour to atone for his youthful sin so far as he is able; and though truly, as the for his youthful sin so far as he is able; and though truly, as the motto of the book says, "that which is crooked cannot be made straight," and a wrong once done cannot be undone, yet Sir William Severn's repentance for a sin which, bad as it was, is not so bad as Argus believes, is so sincere that we cannot help wishing, weakly perhaps, that his son had been brought to forgive him carlier, and that a few rays of sunshine might have lightened up the gloom before it was too late. Doubtless Mr. Jackson's sterner the gloom before it was too late. Doubtless Mr. Jackson's sterner method is the better art; and it might have been an error to have shown how, even with a nature like Argus Fairbaira's, use must necessarily blunt the sharpest edges and wear down the roughest points, and how, when he had fully come to his manhood, he would have found that a good fortune and a fine estate salve over the little scar of illegitimacy in the world's esteem as if it had never been. Moreover, a man learns to regard himself more from the point of personality than from that of family, save indeed when the family is specially notable; and where the himself is better than his hirth, the shame that was so poignalt

" Arpus Fuirhaire. By Henry Jackson, Author of "Glibert Rugge," Hearth Ghosto," See, See. 3 vols." London: Bampana Low & Co. 1874.

in the time of his uncertain youth dies out altogether when he is a man among men, certain of his own position and able to defend it, and not merely a nameless friendless little waif, cast as a victim among the youthful tyrents of respectability and acknowledged parentage. We acquit Mr. Jackson of all leaning towards mawkishness, as we have said; but we cannot acquit Argus Fairbairn of morbidness; and we imagine that most readers of this book will feel the same desire as ourselves to see him roused into something more healthy and essentially

most readers of this book will feel the same desire as ourselves to see him roused into something more healthy and essentially masculine than he is. It is a part of all true manliness to accept one's burdens, whatever they may be, with dignity and self-control. The episode of the commonplace if fine-voiced singer, Melusina Meadows, and her drunken disreputable "pa," has a certain echo of Thackeray's immortal Costigan running through it. It is a somewhat trite representation of the impecunious Bohemian, living partly by his wits and partly by the exploitation of a daughter's talent, and has no special originality of treatment or detail to redeem it from the charge of repetition. Arrus Fairbairn's honest love wasted on such a wretched piece of of treatment or detail to redeem it from the charge of repetition. Argus Fairbairn's honest love wasted on such a wretched piece of selfishness is also after the manner of Thackeray; and the interruption to the marriage at the last moment strikes no as somewhat forced. Though eleverly led up to, it comes too much like the sudden appearance of the god out of the machine who was appointed to unravel all the hard knots and extricate the plot from hopeless confusion; and surely the mask drops a little too suddenly, and the revulsion of feeling with "Gus" is somewhat too broadly stated. At the worst, her marriage with him would have been a step into social respectability for the fair Bohemian; and she might have calculated on her power to make the husband accept what the lover had rejected. If beneath all her calculation there existed the power of so much real love as appears at the end of the chapthe power of so much real love as appears at the end of the chapter, and if she did honestly care for the young man though she ter, and if she did honestly care for the young man though she cared for wealth and ease and luxury more, we cannot but think she would have temporized more; and Gus seems to us to have been too blind all through to have been awakened at the first shake. Had his faith in his ideal been undermined by a series of those small unheeded touches which have no apparent present influence, but which suddenly assume a cumulative power when the final blow comes, it would have been the higher art. And in a book which has such pipe discrimination of character and which deals which has such nice discrimination of character, and which deals so delicately with the growth of feelings and convictions, this some-what new and unlooked-for transformation brings with it a sense of unfitness that mars the harmony of the whole. Gus was intensely silly in his love for Melusina; his very honour towards her was want of common sense, if the evidence of a fine nature; but the final break was a little cruel as well as crude, and in spite of all her native sordidness, the singer had some show of reason on her side. What attractions she had, apart from her voice, must have been only physical; and a pure love for a gross nature is always painful to read of, and difficult to make either interesting or

likely.

One of the best characters in the book is Lady Severn. There is a wonderful beauty and delicacy about her all through, and the conflict of womanly sweetness with wifely jealousy and shame is admirably shown. Her conduct to Gus and to his mother when she knows their relations to her husband is very nobly conceived as well as narrated. We see in it what the author has not expressed in so many words, that besides her womanly sweetness she had also the capacity for a certain broad justice, a certain liberality of judgment by which she accepts the fact that her husband's past, before he was married to her, was his own and not hers, and that though it would have been better, as things were, had he confided in her, she had no right to demand his confidence or to resent his in her, she had no right to demand his connidence or to resent his action. She is admirable all through, and, though perfect, not wearisomely so. She and Carry Fairbairn are indeed the only really nice women in the book; for poor Lois Williams is little more than a large pair of eyes with perpetual tears in them—one of those melancholy Niobes of fiction who may be very pretty took at, but would be decidedly depressing to be with; and who are unable to resist the love of men or the "folly" to which they are asked to stoop. She is a pretty tender invertebrate creature are unable to resist the love of men or the "folly" to which they are asked to stoop. She is a pretty, tender, invertebrate creature for whom one feels any amount of compassion, mingled with some little dash of contempt; but Lady Severn, who is quite as tender, has more power, and is by so much the more delightful.

It was necessary for the purposes of the story that her people should take Lois away with them to Australia, knowing her

condition and the position of the father of her unborn child; but it was not what the ordinary peasant, Welsh or other, would have done. In the first place, the fact of the seduction and its consequences would not have caused either so much surprise or consternation as the author has expressed; and in the second place, the gentleman would have been made to pay. If Lois found no way of communication open to her, and no answer sent to her loving letters, her nucle and the virago who was his wife would loving letters, her uncle and the virago who was his wife would certainly have put the matter into the hands of a lawyer, and have got compensation for the injury done to them. They would never have quietly put up with the extra expense of the haby, and they would have either found Mr. Tressant or sent Lois to the workhouse to reap the hitter harvest of her imprudent trust iff the best way she might. Again, if Tressant honestly intended to marry her, as he did, would be have seduced her? If no exist, he was no scoundrel; he was a man of apparently too high and honourable a nature to degrade into his mistrees the woman hamemat to be his wife. Of course, if he had not done so, Aryan Marketon would never have been waiten, or it would have been.

constructed on quite a different groundplan; but, though more immoral, it would surely have been more likely that Tressent never intended to marry Lois at all, though probably he would have taken her to live with him; or, if his passion was so far master of his worldly wisdom as to make him determine to raise an untaught peasant girl into the position of his wife, he would then have been careful of her for very self-respect, and the catastrophe of the little Argus would never have happened.

One of the graphic little touches of this book, where the action is neither overloaded nor abrupt, but sharp and incisive, is the fatal scone between Tressent and his mother. As good in its own way is the death of poor Gus, when, reconciled with his father, but not with life, he dies of the heart disease that has long possessed him. He dies forgiving the man whom all his life he had, unknown, hated, and, when known, not loved; but his last look goes to his quasi-father and long-time tutor, whose influence over him had always been so good, and whose love was the dearest he had known. The whole of the end of the book is singularly pathetic, and the scene between Gus and Lady Severn, when she comes to beg him to forgive his father and be reconciled to him, is touching in the extreme. The lady's firm yet tender tone, the man's hard reluctance breaking down at last into such a passionate outburst when the poor lonely soul scemed to feel the sudden need of love and the greater nobleness of forgiveness over resentment, are beautifully portrayed. It seems a to feel the sudden need of love and the greater nobleness of for-giveness over resentment, are beautifully portrayed. It seems a pity that the brighter thread should have been cut short so soon; and that, after all, the reconciliation between father and son should be but a rootless affair so far as Gus was concerned—a simple conquest over bad feelings rather than the well-grounded existence of better ones. It might have been more commonplace to have ended the story differently; but it would have been more cheerful; and we own to a preference for novels that end in sunshine rather than in gloom. Gus had had so much experience of life as leads to wisdom, and he might have developed into a noble fellow enough now that he had had some of his youthful pride and passion knocked out of him, and had learnt the sweet uses of advances. The hook houseast are if sadder then we like is one versity. The book, however, even if sadder than we like, is one of the best novels we have seen for some time. It is the work of a thoughtful and cultivated man, and, if not without flaw, has so many more beauties than imperfections that we accept it and are grateful.

FRENCH LITERATURE.

M. ALFRED RAMBAUD has just published a volume * which may be considered as a sequel to the one we reviewed some time ago, entitled Les Français sur le Rhin. The reviewed some time ago, entitled Lee Français sur le Rain. The object of his present work is to show the results produced by the battles of Austerlitz, Jena, and Wagram, and to illustrate the state of Germany under the Napoleonic régime. M. Rambaud endeavours to prove, not only that the armed propagandism carried on by the French Revolution was cordially received on the other side of the Rhine, but that the Germans sympathized with Bonaparte's early system of Continental policy. Resistance with Romaparte's early system of Continental policy. Resistance took place, he says, only when the French Emperor sought to apply for his own sollish purposes theories which in themselves were unexceptionable. The taxes were indeed more equitably assessed by the conqueror than they had been under the old administration; but, on the other hand, they became every year increasingly heavy. The military conscription was at first infinitely preferable to the recruiting system which had previously obtained, but it gradually became an intolerable scourge; and, finally, the Germans felt insulted by the dictatorial and never-ceasing interout it gradually occame an intolerable scourge; and, inally, the Germans felt insulted by the dictatorial and never-ceasing interference of Napoleon between their rulers and themselves. Such, according to M. Itambaud, were the causes which inarred all the beneficial results of the revolutionary crusade, and which ended by binding together against France Liberals such as Fichte, Arndt, and Dornberg on the one side, and the champions of the old order of things on the other.

It has often been remarked that there are in France two legends It has often been remarked that there are in France two legends which need to be reduced to the proportions of sober truth. The Napoleonic legend is just now passing through a severe ordeal, and M. Lanfrey, amongst others, has done much to strip it of its fictitious character; but the revolutionary myth has not yet been dealt with so completely. M. Felix Rocquain has contributed a very interesting volume † towards this desirable end, and his work is the more valuable because the Revolution is left, so to speak, to give evidence for itself by the mouths of some of its most accredited agents. It appears that about the beginning of the year IX., the Consular Government ordered several Councillors of State, Fourcroy, Barbé Marbois, Champagny, Lacués, Thibaudeau, Duchâtel, &c., to draw up a series of reports on the situation of State, Fourcroy, Barbé Marbois, Champagny, Lacués, Thibaudean, Duchâtel, &c., to draw up a series of reports on the situation of the country; M. Thiers refers to these documents in his Histoire du Consulat et de l'Empire, and evidently had managed to get access to them. Unfortunately, several of the reports prepared in pursuance of the Consular decree were lost, whilst others saw the light only after an interval of two or three years, and therefore cannot be regarded as accurately representing the state of things at the period they were intended to illustrate. Sufficient details, however, are found in those which M. Rocquain has published to give a very striking ides of France at the time when the Directory expired under the universal contempt

^{*} L'Allamagne sous Napolige I. Par Alfred Rambaud, Paris: Didier. † L'état de la France au 18 Brumaire, Par M. Fálix Rocquin. Paris:

of the nation; and the excellent introduction prefixed by the author forcibly brings out the conclusion suggested by the facts before him. He has no difficulty in showing that the Consular

before him. He has no difficulty in showing that the Consular Government did not meet, as some historians imagine, with enthusiastic and universal sympathy; on the contrary, the general feeling was indifference, and the new order of things was only regarded as a temporary political experiment.

M. Jules Simon writes on education as a man having authority, and his book is one which might lead to important results on the other side of the Channel, if Frunchmen, with all their revolutionary proclivities, were not, after all, thoroughly wedded to routine. His great objection to the existing system of secondary instruction in France is that, instead of preparing young men for instruction in France is that, instead of preparing young men for the battle of life, it merely qualifies them to pass examinations. "Non vitro, sed scholes discimus," said Seneca, and the remark is perfectly applicable to-day among our neighbours. M. Jules Simon does not wish to do away with the examination for the bacoslauréat; but he would reduce it to its proper limits—namely, to a test of the instruction given in the Colleges. The first part of his volume is a criticism of existing institutions; the second and third contain successions for inprovement and reform

first part of his volume is a criticism of existing institutions; the second and third contain suggestions for improvement and reform. The philosophical theory of Schopenhauer † is undoubtedly one of the most singular which have appeared within the last few years in Germany. And yet, notwithstanding the volume devoted to it by M. Foucher de Careil, it had never yet been thoroughly studied in France, for the simple reason that there existed no summary of it sufficiently complete to furnish the uninitiated with an intelligible account of the system. M. Ribot has undertaken to supply the deficiency, and we think that he has been successful his modest brochure is one of the most satisfactory instalments of M. Germer-Baillière's Bibliothèque de philosophie contemporaire. It begins with a short biographical sketch, and then goes on to examine Schopenhauer's method of dealing with the intellect, the examine Schopenhauer's method of dealing with the intellect, the will, asthetics, and ethics; the final chapter contains a critical examination of the nature and tendency of the leading doctrines

examination of the nature and sendency of the leading economists of the present day. Several years ago he was entrusted by the Académie des Sciences morales et politiques with the mission of inquiring into the state of the manufacturing classes throughout the state of the manufacturing classes throughout the state of the concluding one of the France, and his present volume is the concluding one of the sories. The recent fluctuations in the price of coal, and the necessary effect of these on the iron market, give additional interest to M. Reybaud's now publication, and will no doubt help to recommend it to the attention of readers. He holds that the rise of which consumers have so universally complained is mainly due of which consumers have so universally complained is mainly due to the political events of the last few years, but he is of opinion that prices are not likely to be materially reduced, because the coal beds are not inexhaustible. In order to give as complete an idea as possible of the branch of manufacture examined in this volume, M. Reybaud has studied successively several of the leading centres in Tanana much as Augin Le Courset Requestional and St. France, such as Anzin, Le Crousot, Fourchambault, and St. Chamond; he is thus enabled to compare the various systems adopted in different places, and to note their comparative advantages. His inquiry is followed by an account of the Internationals, and of the establishment founded by M. Godin at Guise, in the North of France, under the name of Familistère, for the handit of groshram benefit of workmen.

The third volume of M. de Lamartine's Correspondence § com-The third volume of M. de Lamartine's Correspondence § comprises a period of six years, beginning with 1820; it was unquestionably the happiest part of his life; it was that at least when he produced the writings which have placed his name so high on the roll of contemporary French literature. The Méditations postiques, the Nouvelles méditations, the Dernier chant dis peterinage a Harold, belong to that time; and certainly M. de Lamartine's muse never took a higher flight since, even in the beautiful poem of Joselyn. The correspondence relating to the year 1826 begins with two letters addressed to Colonel Pepe, a Neapolitan officer who had felt himself annoyed by a couplet of the French poet on the degeneracy of modern Italians. A duel was the result, and M. de Lamartine received a sword wound in the arm. Several of the persons to whom his letters are addressed have left an honoured name in politics and in literature, such as M. de bonoured name in politics and in literature, such as M. de Genoude, the Duke de Montmorency, and M. Aimé Martin; others are less familiar to us, and we cannot help regretting that Madame de Lamartine should not have adopted the suggestion we ventured to make on a former occasion, and added to the interest of her publication by a few short biographical notes.

M. Picot's thick octavo || is a learned manifesto on behalf of the democratic constitution of the Church. Ho begins by arguing that

the constitution of the early Church clearly confers sovereignty and its three attributes—namely, legislative, judicial, and administrative power—on the whole congregation of the faithful, and not on the ministers of the Church exclusively; the holy communion is, he contends, a confirmation of this, and a sufficient refutation of those who look upon the Church either as a monarchy or an aristocracy. The history of the Church, he says, proves that the want of har-

mony among Christians, and the multiplicity of seets and a are entirely owing to the substitution of the monarchical, of the democratic, element in the constitution of Christen of the democratic, element in the constitution of Christendom; a substitution which must finally prove fatel to the Pope himself. Whatever may be thought of M. Picot's views, or of their consistency with his Catholic professions, it must be evened they he develops them with great clearness, and he must be commended for his chivalrous efforts to show that a right conception of Christianity would immediately silence all the objections of unbelievers. Let it be once clearly understood, he says, that democracy is the exercise of the Church and was min cure the receivers of the Church and was min cure the receivers of the Church and was min cure the receivers of the Church and was min cure the receivers of the Church and was min cure the receivers of the Church and was min cure the receivers of the Church and was minimated to the constant of the constant execute of the Church, and you win over the majority of the

thinkers.

M. Charles Wiener has devoted an interesting and substantial volume to the history of the Empire of the Inces; his information, derived from the best sources, is thoroughly digested, and in the reader in an attractive manner. After an introductory chapter on the geography, the topography, and the climatology of the country where the primitive kingdom of Cuzco was established, M. Wiener discusses the origin of the American Indians, whom he considers as descended immediately from the Asiatic races—Hindoo, Hindoo-Chinese, and Mongolian. A rapid historical sketch occupies the third chapter; we have then an account of the laws which governed the kingdom of the Ineas, and, lastly, a survey of the religious institutions of the people. Here it is that the original and distinctive feature of M. Wiener's Here it is that the original and distinctive feature of M. Wiener's work appears. Humboldt had already observed that the Empire of the ineas "resembled a huge monastic establishment, in which every member of the community was told what he had to do no his share towards the general prosperity; . . . the founder of Cuzco, whilst flattering himself that he could oblige men to be happy, had reduced them to the condition of mere machines." Our author, expanding this idea, shows that the political régime of the old Peruvians was simply communism strictly applied, and he takes the opportunity of relating the Utopias of modern revelutionists. If a handful of foreigners were capable of conquering an Empire such as that of the Incas, apparently so strong and so an Empire such as that of the Incas, apparently so strong and s coherent, the reason must be sought not only, nor even chiefly, in the superiority of European tactics and in the use of firearms; in M. Wiener's view, it was rather the deplorable constitution of a society administered on communistic principles that left it an easy prey to the attacks of enemies from without.

M. Émile Worms is already well known by his book on the Hanseatic League, and his present volume is in some measure a contimustion of the subject which he attempted to discuss some years ago.† The unity of Germany and the formation of the Zollverein were looked upon as Utopias untilquite recently; they are now established facts, and well worth the attention of readers interested in the problems of political economy. M. Worms has given a complete account of the gradual development of the commercial league which brought about the creation of the Zollverein, and he traces its origin as far back as the sixteenth century. It appears that a plan was then conceived of establishing custom-houses on the whole line of the Imperial frontier, with the view of securing to the sovereign independent fiscal resources. Charles V. favoured this plan, as might well be supposed, but the intrigues of the German cities prevented it from being carried out, and thus it was that the welding together of the German States into one compact whole was delayed for the space of three centuries. Our author goes carefully throughout the various stages which ultimately led to the organization of the Zollverein, and concludes with a tubular statement of the tariffs at present in force.

Pope Gregory XVI., amongst his numerous merits, had the one of being extremely fond of French novels. In his time Parisian works of fiction were not quite so startling as Madame Bovery or works of hetion were not quite so startling as Madame Borary or La femme de feu, but some of them were sufficiently coarse, and we scarcely think that the well-known poet would have said of Mon cousin Raymond!, "I a mère en permottra la lecture à as fille." Yet the author of that work was a special favourite with his Holiness, and whenever a Frenchman happened to be received in private audience at the Vatican, Gregory XVI, never failed to ask, "Come sta il Signor Paolo di Kock?" We have now before us the first and, unfortunately, the only volume of Paul de Kock? ask, "Come stail Signor Paolo di Kock?" We have now before us the first and, unfortunately, the only volume of Paul de Kock's memoirs. If ever any man was able to describe the French literary society of the nineteenth century, it was undoubtedly he who used to be nicknamed le romancier des cuinnères. He parsisted, however, for a long time in refusing to publish his memoirs; and when, at last, repeatedly urged by his friend Benjamin Antier, he yielded, it was too late, and he did not livelong enough to give more than the first volume, which now appears, edited by his son. It is an amusing book, full of anecdotes, and contains, amongst other curious things, a letter written to Panel de Kock by the author of Eugene Aram. de Kock by the author of Eugene Aram.

M. Léonce Dupont makes no secret of his Bonapartist symps thies, and he gives us a volume of nearly three hundred pages on Napoleon IV. He acknowledges, it is true, that very little can be said as yet about the young Prince, but it is not difficult to fill a good-sized duodecime with extracts from the newspapers, and to add a chapter of concluding remarks. M. Dupont asserts that

Le ge

the Imperial Primes is destined to save France from disorder and anarchy, as his father and his great-uncle did before him. It would be ridiculous to deny that the energy both of Napoleon II. and of Napoleon III. checked for a time the progress of revolutionary folics; but it may fairly be questioned, on the other hand, whather the faults of these two rulers did not help to bring about a Vate of political disorganisation much worse than the one they id to agreet

endiavoured to arrest.

The volume entitled Les représailles du sens commun which we had occasion to notice some time ago gives us a very favourable idea of M. Xavier Aubryet. Madame Feure Luière * is not nearly so good, but it contains a few annising chapters; and when the author deals with the Republicans of the Extranse Left and the colleagues of Citizen Delescluze he is always excellent; the shaft reaches its mark, and strikes home. Let us mention, for fu-stance, the piece entitled *Le roi Gauroche*, where M. Aubryet tells some very plain truths about the Paris voyou. In an age which has witnessed so many attempts to whitewash monsters and abominations of every kind, something surely ought to be done in the opposite direction, and it may be well to show the world what are really the heroes of democratic enthusiasts. The Paris games or voyou is one of those whose titles to glory hest deserve inquiry, and it is high time that the bean ideal of the late M. Boyard's popular vaudeville and M. Victor Hugo's anniable Gauroche should be stripped of their borrowed plumes. This has been done most thoroughly by M. Xavier Aubryet, who will probably be called a reactionist for his pains.

The occupation of Versailles by the Germans during the late

war † is one of the most interesting episodes connected with the campaign. M. Rameau, the Mayor of Versailles, collected a large number of documents relating to the stay of the German armies in the town of which he was the chief magistrate; these documents are now published in chronological order by M. Delerot, and contain a valuable mass of historical information. The company of the contains a property of the company of t piler has almost uniformly abstained from commenting on the evidence which he brings forward, but here and there his patriotic hatred of the Prussians appears in all its natural energy.

M. Montogut has begun a series of excursions through France in the Revue des Deux Mondes, and the first volume, relating to the in the Revue des Deux Mondes, and the first volume, relating to the old province of Burgundy †, now courts our notice. There is abundance of agreeable and interesting reading in these pages, where the author, instead of writing a mere geographical and topographical description—an extract, so to say, from some gazetteer—relates the impressions which this or that city has produced upon him, gives us details respecting the illustrious personages born there, the works of art it has produced, and the great events of which it has been the theatre. Thus Montbard suggests an excellent sketch of Buffon; the village of Milly is inseparable from the name of M. de Lamartine; and Auxerr reminds our author of various unpublished ancedetes about Marshal Davoust. M. Montegut is anxious to walk in the footsteps of Canden, and his endeavours to make a description of France attractive and interesting must be regarded as highly meritorious. attractive and interesting must be regarded as highly meritorious. We hope that all the provinces will in due course be honoured with a visit from him.

The Bibliothèque universelle \$ for February contains a number of articles which deserve careful reading, M. Mérimée and the Lettres à une inconnue occupying a prominent place. It is much to be regretted that the unquestionable merits of the author of Colombs. as a writer cannot be judged independently of his moral character; but the two volumes of correspondence which have lately created such a sensation both in France and abroad render this impossible, and we can only wonder that the incomme, if she had any respect for her admirer's memory, should have allowed the publication of his letters to her. M. Adolpho de Circourt touches chiefly upon Prosper Mérimée's intellectual superiority, and have discourt of animon is account pussible. M. Charles here diversity of opinion is scarcely possible. M. Charles Secretan's remarkable essay on Mr. Matthew Arnold's Literature and Dogma must also be mentioned; and, finally, M. Tallichet's article on the idea of federation, suggested principally by one of Proudhon's works which was published ten years ago.

Tartuffe, Amphitryon, Georges Dandin—such are the three plays which form the fifth volume of M. Pauly's new edition of Molière. It is a great temptation to a critic to have an opportunity of saying something about the illustrious French comic writer; for, not withstanding all that has been printed in commendation of Molière's genius, the terseness of his versification, and his won-derful skill in delineating character, the subject seems inexhaustible. The Tartuffe, for instance, has produced a perfect library of pamphlets, sermons, estires, and critiques; it has called forth a greater amount of animosity and bitterness of spirit than almost a greater amount of animosty and ofterness of spirit than almost any other comedy ancient or modern, and it has acquired a kind of political importance, thanks to the violence of certain religious partisans. Many persons have thought that Molière, in composing his play, had the Jesuits in his mind's eye. M. Sainte-Berry seems to have approached nearer to the truth when he said that the

sharecter of the hero of the piece was rather intended to degree the blind exaggerations of the Jansenista. At any rate, when we think of the immonse influence which the clargy enjoyed at Versailles where the play thus acted for the first time, we may well admire the buildness of the author. About Amphiryon, with its evident allusions to Madame do Montespan and her scandalous amours, the less said the better. Georges Dandin is almost as objectionable on the score of morality; but it conveyed, on the other hand, an excellent lesson to those beargasis who, at the risk of their own happiness, sought to associate with people of a higher social position than themselves.

CAMBRIDGE EXAMINATION for WOMEN, 1874.—CANIMDATES are requested to send in their Names by March 20 to Mrs. A. Dicsy, Hon.

Bea., My victoria street, S.W.

BRIGHTON COLLEGE
Patrons—The Lord Bishop of CHICHESTER, the Duke of DEVONSHIRE,
Lord LECONTIELD, the Margule of BRISTOL, ac.

Lord LECONFIELD, the Marquis of BRISTOL, &c.

President... The Earl of CHICHESTER.

Principal... The Rev. C. HIGG, M.A., late Senior Student and Tutor of Ch. Ch., Oxford,
BRIGHTON COLLEGE offers the usual Public School Education in a most healthy climate
neouliarly favourable to boys of delicate constitution. Special arrangements are made for
Puplic presering for the Civil Service. The Modern Forms have been organized with great
care, and provide a thorough, liberal, and practical reducation for Boys intended for business or
the sative professions. There is an excellent Laboratory, Workshop, &c. The School is well
sendowed with Robolarships and Exhibitions. Terms 80 to 80 Guiness per annum according to
age...Address, the Rev. the SECRETARY.

A BINGDON SCHOOL, Berks (Six Miles from Oxford), cld Foundation has extensive new itselfdings on a fine bracing site. A Publ Training is given to the SUNE of CLERGY Men and CENTLEMEN at a very mode Above the lower Forms there are two divisions; one prepares for the Universities, other for the Bervices. Froziscianis Examinations, and Mervanite Life. The bevaluable foliolarships at Oxford.—Apply to the Read-Mester, Rev. E. SUREMENT.

EDUCATION at ZURICH.-Mr. F. DE BAUDISS, formerly MAJOUALAUM SE ZUIKUII.—AIF. F. DE DAUIISS, 10FMeH;
One of the Assistant Master at Wellington College, receives a limited number of
FUPPLS, and will have VACANCIES at Easter. The house is healthily situated, and the
type of living is armanged to suit fanglish habits. Mr. De BAUDIES is assisted by competent
beautre, and is able to offer, in addition to French and German, and the usual subjects of a
liberal education special habilities for the study of Physical and Mathematics Reince,
Advanced Papils have the opportunity of attending the Lectures of the Polytechnic School our
Engineering, Agriculture, and other branches of Appiled Science.—For terms and references,
apply to F. De Baudies, Wiessenstrasse, Seefeld, Zurich.

DUCATION in BERLIN.—A PROFESSOR of LANGUAGES receives into his family YOUNG ENGLISHMEN desirous of acquiring rough knowledge of GERMAN. Good English refurences.—Apply to Dr. W. BEREMANN, tretrame 36, Berlin. EDUCATION in

WOOLWICH and ARMY DIRECT.—Rev. Dr. HIGHES
(Wrang. Cam.), who, with Twenty Year' experience, has passed 300 (Ind last Reptamber,
for Woolwich), reserve a few FUPILH expressly for the above.—Castlebar Contr. Ealing, W.

HOLKESTONE.—Mr. W. J. JEAFFRESON, M.A. Oxon.
(formerly Principal of the Elphinstone High School, Bombay), will continue, with the
Austrance of a Cambridge Honoure-Man, to prepare PUPILH for the Universities, Lables
Christ Bervice, Woolwich, and all Competitive Examinations.—Terms and References on

MR. GLADSTONE AND THE OPPOSITION.

R. GLADSTONE'S letter to Lord GRANVILLE will set at rest for some little time the vexed question as to the leadership of the Opposition in the House of Commons. Mr. GLADSTONE offers to assume the duties of leader during ble present Session, although he points out that his great need of rest will prevent him from appearing very frequently in the House. Before another Session commences, the Liberal party can meet and consider what course they are prepared to take, and whom they will elect to follow. An alternative course is indeed indicated; and Mr. GLAD-STONE suggests that, if the Opposition like to choose a new leader at once or to provide themselves with a leader during this Session who can give more time and trouble to the discharge of his duties than Mr. GLADSTONE can, no one will acquiesce more heartily in the decision of the party than he will do. But so long as Mr. Gladstone is willing to lead no one else can have any pretension to do so, and the Liberals will be only too glad to have him to lead them whether his attendances at Westminster are frequent or rare. Mr. GLADSTONE needs rest, and is quite entitled to take it; and on no ground was the recent change of Ministry more desirable than because it was evident that the best members of the late Government were physically exhausted by five years of incessant hard work. it is not only of the present that Mr. Gladstone thinks the speaks. He plainly intimes that he does not look forward to being again Prime Minister. He feels that years are telling on him, and he wishes, if his life is spared, to pass through old age more quietly than is possible when the mind is burdened with the heavy load of political life. This is a natural and in some ways a legitimate wish, and it is no use inquiring too closely how far it is likely to be realized. The present Ministry, unless it goes out of its way to make gross blunders, will probably last a long time; and even if Mr. GLADSTONE were as eager for office as he is indifferent to it, he must feel that he might be too old to act efficiently as Prime Minister before he had an opportunity of holding office again. his very indifference to office will enhance his value both in the country and in Parliament. If he criticizes a Budget or opposes a Government Bill it will be believed that he is doing so, not that he may win a party triumph or annoy his adversaries, but that he may serve what he honestly believes to be the interests of the nation. Outside Parliament there is certain to be a reaction of feeling in favour of Mr. GLADSTONE. The same people who were anxious to stop him in what they thought a wrong course, who were offended by his tone, or alienated by his colleagues, will begin to feel something of pity and regret and a little personal contrition when the details of Mr. Gladstone's administration are forgotten, and when the greatness of the things are did and the greatness of the things are did and the greatness of the hamiliation to which he was subjected alone survive in their memories. This reaction must have come in any case; for if Englishmen have any marked political characteristic it is that of being just and generous to statemen when out of office. But the change in public feeling will be much intensified when it is conceived that the services of Mr. Gladients ere no more at the command of the nation. If an area on amouthly in the years during which lived lives and a subset to do public service, the sentiment this withdrawal from the scene of politics may
the one to which man will gradually become
the one to which man will gradually become
the one to which a crist arriver and it is though
the one to the one desired to the one

with all his yearning for repose and a secluded peaceful old age, he may and it impossible to resist.

Even if Mr. GLADSTONE only nots as leader of the Opposition during the present Session he will coaler a great benefit on his party. What the Liberals want is time to look round them and set themselves to discover what they mean and what they are aiming at. They are viry wisely beginning to repair past neglect, and to bestow that amount of careful attention on small details like registration which proved so profitable to the Conservatives at the recent election. But no degree of attention to details can give life and vigour to a party. It must have general can give life and vigour to a party. It must have general views, a general standard of criticism, a general bond of union. At present the Liberals are totally without a The wiser of them know this, and say nothing; policy. The wiser of them know with, and the only ave able means of imprinting a character on the party is to collect all the wild notions and extravagant crotchets of extreme partisans into a bundle and to shrick out that this is the true programme of genuine Liberals. If they are again to get a real hold on the country, the Liberals must work out a new policy with great caution, and tentatively. They must realize the fact that the present Government is the representative of that moderate Liberalism which alone the country will telerate. A Liberalism which shows a strong and determined front to revolutionary measures, to fanatics of all kinds, and to Home Rulers, is the Liberalism which the country desires, which the present Government can offer, and which the Opposition cannot offer. It is evident that the Liberals are thus placed in a position of immense disadvantage. Nobody wants them; they have nothing to say, nothing to propose. But it can scarcely fail to happen that, in the sphere of moderate Liberalism, room should not be gradually created for two parties. The present Government are sure to make some mistakes from which opponents may draw a legitimate advantage. Although there is a good array of ability in the Cabinet, there are men in it whose strength lies in clearness of perception within narrow limits rather than in width and comprehensiveness of grasp. There will be sides of great questions which such men may be expected to fail to see, and a Liberal, without being revolutionary, may inspire the conviction that he sees further into the difficulties and ultimate issues of such questions than his opponents. England cannot for ever stand still, and there may be changes which, disfigured as they now are by the paltry platitudes of shallow enthusiasts, may assume, under the transforming influence of prolonged discussion, a shape which may be attractive to a nation that loves to blow cold one day and hot another. But it is only by patience and watching and reflection that the Liberal party can find out where their true openings lie. Time is their first requisite, and Mr. GLADSTONE offers them at least an amount of time that is infinitely better than none. under no necessity and under no temptation to hurry his party onwards; whereas a subordinate suddenly raised to steeldental eminence might easily be persuaded that he could only justify and retain his leadership by acts and utterances of a bold and random indiscretion.

If Mr. GLADSTONE ceases after the present Session to act as leader of his party, these must be some one to lead it; and wheever leads the party in the House of Commons must either be Prime Minister when a change of Government takes place, or, if Lord Guanville were to hold an office to which his claims are very considerable, must be the equal and the mainstay of the Premier. There is no man known to the Laborat party at present of whom it can be a satisfied even to think of holding such a

post. There are men of incontestable ability in the front ranks of the Opposition, but there is no one to outshine the rest. When it was supposed that Mr. GLADSTONE would not act as a leader even for the present Session, and that a leader of some sort must in decency be discovered and nominally accepted, the party seemed in its despair to be gravitating to the selection of the Marquis of Hartington. Howas to be made a leader not because he was specially fit, but because he was the son of a Duke. This choice seemed advantageous, because his colleagues would feel less reluctance to being postponed to him when promotion was avowedly made a matter of social superiority, because the constituencies would thus have it brought home to them that there were great people on the Liberal side, and because, as Lord Hagrington must be a Duke some day, it was certain that he could ultimately be got rid of. He was, too, known as a man of good sense, moderation. and adequate capacity, and so no one would be ashamed of being led by him. These reasons are of rather a humble kind to determine the action of a party which lately prided itself on its identification with the people and on its intellectual strength. But beggars cannot be choosers, and, as things go, it is not easy to see how a botter choice could be made. But if the Liberal party has time given it, the man best fit to lead it when Mr. GLADSTONE retires will be gradually discovered. Opposition offers many opportunities to men of real ability. Although they cannot change the purposes of a House swayed by a strong Government, they can speak to the nation; they can make men see that in them there is a real reserve of political force; they can defend endangered interests and uphold neglected principles. The Liberal who can give the Liberals a policy, a hope, and a chance is that Liberal who determent to lead his party. If there is such a man he will only have to subserval, and orthogonally librory reluctantly, obey him. As Lord Denry lately observed, Palmam qui meruit ferat. The longer Mr. GLADSIONE retains the leadership of the Opposition, the better opportunity he gives his party to discover whether there is any one who deserves the palm, and then, when Mr. Gladstonk retires, the deserving man may bear the palm he has deserved.

END OF THE ASHANTEE WAR.

SIR GARNET WOLSELEY'S motive for halting on his return march from Coomassie to the coast is at last satisfactorily explained. It was not to be supposed that he had relied simply on the Kine's assurances, and it might have appeared that, after the destruction of his scapital, the Kine had nothing to lose, and therefore had nothing to gain by a treaty. A few days before the date of his last despatches Sir Garnet Wolseley know nothing of Captain GLOVER's advance, which has turned a military success into a complete political success. The other officers who had been employed to raise native levies utterly failed in their attempts to induce any part of their force to enter the Ashantee country. Captain Burner and Captain DALBYMPLE finally abandoned their enterprise, although, according to Sir GARNET WOLSELET'S generous acknowledgment, they had in the meantime effected, through the unessness caused to the enemy, a useful diversion in favour of the main body. Captain GLOVER had on the 30th of January advanced with a force of auxiliary troops to a point only twenty miles distant from Coomassie; but although he must have been almost near enough to hear Sir Garner Wolseley's guns, he had neither effected a junction with the English army, nor even succeeded in conveying intelligence of his movements to the Commander-in-Chief. During the following days Captain Glover con-tinued his advance, and despatched Captain Sartorius to the camp of the Commander-in-Chief. Finding themselves threatened in the North after the destruction of their capital, the Ashantees appear to have been struck with panic. The overtures for a treaty which induced Sir Garner Wolseley to halt at the Adausi hills were the genuine result of terror.

Optimists have naturally remarked that the destruction of Coomassio will produce a more lasting effect on the public opinion of Western Africa than any treaty which could have been recorded on parchment; but Sir GARNET WOLSBLEY apparently held a different opinion when he hoped to induce the King to make peace in person. There are not sufficient materials for judging whether the result of the expedition will be the destruction of the

Ashantee power. The coast tribes have afforded clear indications of their profound respect for an enemy who evidently possesses great capacity for warlike organisation. Little or nothing is known of the Mahometans or Pagans of the interior, who may either be encouraged by the proof that Coomassie is not absolutely unapproachable, or impressed with the inability of the European invaders to retain their conquest for three or four days.

Ashantee kingdom, like every other power, depends for existence, not on the judgment of neighbours, but on its own intrinsic force. Recent experience has shown that the King can muster a large force, and that his troops can fight with much obstinacy. Without arms of precision, guns and rockets, and English skill and discipline, no invader could have made his way to Coomassie. even certain that the defenders of the country will acknowledge their defeat. The legends which will preserve for indigenous use the history of the war will be in the first instance shaped by the Ashantees themselves; and the lion will probably invert the fable by representing himself as victorious against the man. There is perhaps some ground for anticipating the overthrow of the kingdom by internal disorder. Yet it seems that the commands of the King are implicitly obeyed; nor is it known that any discontent is caused by a system of government which scarcely approves itself to a civilized judgment. The withdrawal of some of the chiefs in the neighbourhood of the Prah from the Ashautee territory may perhaps deprive the King of the services of some of his foudal dependents; but it also implies that the integrity of his dominions will not be impaired. There can be little doubt that for some time to come he will be incapable of aggression. The future fortunes of the Ashantee monarchy, whether it prospers or collapses, will be regarded in England with profound Andifference as large as there is no recomplet the war.

As a political experiment, the result of the campaign is practically conclusive. In other uncivilized countries. occupied by different and hostile tribes it has almost always been found possible to conduct wars against dominant races with the aid of native auxiliaries. troops have formed, according to the well-known illustration, the steel head of the lance; but it has not been necessary to depend exclusively on their exertions. In the recent campaign the West Indian regiments have done valuable service, and the strange names which are included in the lists of killed and wounded show that it has been possible to find a certain number of recruits on the coast; but with the exception of a few hundreds out of Captain GLOVER'S thousands of levies on the east of the Volta, no native chiefs or tribes have rendered any assistance to the expedition. There may possibly have been some misapprehension as to the motives of their backwardness, for it is not certain that the Ashantees were generally regarded as enemies, or the English as deliverers; but barbarona races are more likely to have been influenced by fear than by political considerations. Whatever may have been the reason of the failure to raise auxiliary troops, it is impossible to maintain a protectorate over unwarlike or disaffected tribes. No training would enable the Fantees to defend themselves against their formidable neighbours; and they have assuredly no claim to be secured against the natural consequences of their inefficiency. It may probably be worth while to maintain coloured garrisons in a few fortified posts for the protection of trade; and for some years to come the memory of the late campaign will deter the Ashantees from attempting to establish their supremacy in the districts near the coast. They have no reason to fear unprovoked hostilities on the part of the English authorities. A poisonous climate and an almost impassable forest will secure them against all retaliation less vigorous than the costly and troublesome expedition which has now been completed. In course of time the Ashantees may perhaps make some approach to civilization. The obedience which is paid even to a bloodthirsty tyrant implies a certain political aptitude.

As far as it is possible to form an unprofessional judgment, Sir Garner Wolseley and his officers and men seem to the accomplished their difficult task with admirable energy and skill. The more laborious military training of the present day has evidently not diminished the daring which is still the most indispensable quality of the soldier. The losses which have been suffered are happily not numerous, although it is to be feared that in some office the climate will have aggravated the effect of wounds which might have been otherwise comparatively fasignifi-1. 1. 1. 18 B

cant. Danger and loss of life are unavoidable in war; and it is only when risk is unnecessarily incurred that caspaities provoke irritation as well as regret. A prudent general disposing of troops which are not excessively anxious for their personal safety inspires, just and general pusidence. The courage and pertinacity which were dis-layed in the battle of Amoaful appear to have produced their own reward in the diminished energy of the resistance offered on the ensning days; but on the whole the defence of the capital against a superior enemy is highly creditable to the Ashantee troops. Their omission to harass Sir Garret Wolselet's retreat may be attributed both to the wholesome impression produced by the centests of the previous week and to the advance of Captain GLOVER'S contingent. As the distance from Coomassic increased, the risk of serious attacks would in any case have become less, for the enemy's army was likely to be less numerous on the frontiers of the kingdom, and a pursuing force would have little inducement to cross the Prah. Even an Ashantee army must require some kind of commissariat, and means of carriage for ammunition. the other hand, Sir GARNET WOLSTLEY would, even if he had been attacked, have fallen back on his resources; and he was relieved from the heavy burden of protecting his convoys and lines of communication. As the war has ended without disaster either to the main army or to Captain GLOVER, it will perhaps have been worth its cost in life and money. It has been found possible to punish, if not to subdue, the most warhke and the best organized of African It is well that the superiority of civilized nations should from time to time be tested; and there is some advantage in occasional opportunities of proving the efficiency of the army.

THE GOVERNMENT AND THE BUDGET.

THE first important duty which devolves on Mr DISRAELI'S Government will afford a test of its competence, and perhaps an angury of its continuance in power. It is not so difficult a task to dispose of a surplus as to cover a deficiency; but the firmness which resists clamorous demands is rewarded by fuller confidence than the ingenuity which provides new resources. Mr. Disearca perhaps now regrets the hasty expressions of opinion into which he was provoked by Mr GLAD-10ML's appeal to the prejudices and cupidity of the constituencies, and he will be more seriously embarrassed by the countenance which he has afforded to the project of shifting the burdon of local taxation. The best mode of retrieving his reputation as a statesman and financier will be a tacit repudiation of a policy which was not formed under the responsibility of office. He has judiciously placed at the Exchequer a colleague who possesses a special knowledge of finance acquired long ego under the tuition of Mr. GIADSIONE. If Sir Staifund Northcoth is duly supported by the Prime Minister in the Cabnet, he will frame his Budget with a view to the national interest, instead of attempting to bribe classes and sections of the com-munity at the public expense. It is not to be regretted that successive deputations should prefer argent claims for relief which are necessarily competitive and incompatible. The abolition of the Malt-tax would absorb more than the entire surplus; and, as Sir Stafford Norrheold justly remarked, the removal of duties on beer would, by discouraging the consumption of spirits, entail a loss on the revenue beyond the total produce of the tax. The Malt-tax is, indeed, one of the most anomalous and excessive burdens both on consumers and on an important class of producers; but it has the paradoxical property of sustaining itself by its own weight, inasmuch as the removal of so heavy a burden would utterly derange the fiscal equilibrium. The country brewers who lately urged Sir Star-FORD NORTHCOTE to remove the License duty on their trade unanimously disapproved of the repeal of the Malt-tax, or of its conversion into a duty on beer. They fully explained the inconvenience to which they are subjected by the necessary supervision of the Inland Revenue officers, and perhaps they may either now or at some future time succeed in obtaining relief. The still more recent deputation which saked for the repeal of taxes on food injured its own case by the extravagant demands of some of its members; but it may interest the promoters of the agitation against the Incometax to be informed of a simultaneous demand for the addition of thirty or flusty millions to the present direct tax of equal amount. If the tax were retaxes. Some years have passed since Mr. Dispassing pealed to-morrow five or six millions must be raised in

encouraged the farmers to hope for the sup reduction of the Malt-tax. In one of his late speech thoughtlessly announced his disappressi of Mr. There sugar duty since last year's reduction produces have two millions of revenue, while it interferes with a set of several and another transfer. cated system of trade and manufacture. Mr. Lowe's en-thusastic description of sugar as the luxury of thildhood and the solace of age was just as well as postical. If the remaining duty were removed, the article would be cheapened by more than the whole amount of the tax, and the production of the finer qualities of sugar would no longer be artificially restricted. Mr. Disparal's opinion that the subjects of taxation ought not to be further reduced in number has been formerly held by economists of high authority. Sir George Laws adopted Abthur Young's recommendation that indirect taxes should be distributed over the largest possible number of commodities, but experience has justified Mr GLADSIONE's profesonce of an opposite fineal policy. It is desirable not to interfere unnacemently with any branch of industry, and the indirect operation of Customs and Excise duties is reduced to the lowest point when the revenue is derived from the smallest number of taxes on consumption If Mr. Distant should be persunded by the Chancellon of the Excurquen to repeal the sugar duty, he might defend his meonsistency by the example of Mr. Lowr, who declared that he would never again meddle with the duty only two years before he reduced it by fifty per cent.

The CHANCELLOR of the Excusquer can scarcely fail to find in the shortness of the time at his disposal aff excuse for postponing the inopportune claims of the ratepayers It is greatly to be regretted that both parties have pledged themselves to one of the most questionable schemes of fiscal readjustment. In 1871 Mr. Lown offered to make Mr. Goschin a present of the Housetax in aid of his measure for disturbing the relations of owners and occupiers. Mr. GLADSIONE in his unfortunate Greenwich address repeated the bid for the votes of the ratepayers; and the county members have on two or three occasions followed like sheep the blundering lead of the present Civil Lord of the Admiralty. It would be too much to expect that the Ministers should plainly confess to supporters and opponents that they have made a mistake; but Sir Staff one Northcoth might plausibly urgo his inability to remodel the ancient system of taxation at two months' notice. As all things in nature have some use, even the ratepaying agitation might be turned to account if the supposed necessity of some future readjustment were made to furnish an argument against the mistaken and mischievous clamour for the repeal of the Income-tax. If real property is to obtain a benefit at the expense of personalty, it is evidently necessary to provide or to retain the only tax which falls upon money income. members of the Income-tax deputation have been followers of Sir Masser Lorks, they must have been conscious of the inconsistency of their double demand. Real property is subject both to rates and to Income-tax; but if personalty is not taxed, it cannot be rated. No inference can be drawn from Mr. Diskaril's curt answer to the deputation, except that he is not prepared to sacrifice the whole amount of the Income-tax. To the arguments which were adduced by the majority of the speakers it would have been difficult to reply with respectful gravity; but the deputation was formidable in numbers, nor was it deficient in character and provide the contraction of the provide the contraction of the contr acter and reputation. The members of Parliament who attended in deference to the wishes of the tradesmen in their respective constituencies for the most part maintained a judicious silence; and some of them may be supposed, like Sir Charles Ressler who formally introduced the deputation, to decline all connexion with the agitation which they thought themselves obliged to countenance by their attendance. There can be little doubt that the whole their attendance. There can be little doubt that the whole movement is exclusively promoted in the interest of the shopkeepers, for it is impossible to believe that the workmen of Sheffield or of any other town object to a tex to which none of their class contribute a farthing. It is a proof of political carelessness that no section of the community protests against the repeal of the tax, although relief in one quarter is exactly equivalent to increased or continued pressure in another. No theorist has ever contended

some other form, which would, even if it consisted in the retention of existing burdens, be more oppressive and less equitable than the Income-tax.

Mr. Attenborough, a tradesman who appears to be Chairman of the Income-tax League, blurted out the secret of the agitation by candidly admitting that he had been urged to direct it exclusively against Schedule D. The promoters had, it seemed, more prudently affected to prefer the total repeal of the tax, not probably, as Mr. ATTENBOROUGH alleged, because a claim of partial exemption was selfish, but because the monstrous injustice of their proposal would have been fatal to the hope of success. The levity of reformers who one day propose to tax all incomes arising from property, and on the next day to exempt it, is fully explained by their exclusive regard to their own interest. If the original claim of the League, or rather of its supporters, was defensible, their present demand must be flagrantly unjust. They hope to obtain the support of landowners, bondholders, and shareholders, by offering them a large bribe out of the national revenue. Simple selfishness is perhaps more respectable, and it is certainly more logical, than the sentimental or shills therein diagnics which it constitutes mental or philanthropic disguise which it sometimes assumes. It is difficult to sympathize deeply with tradesmen who object to the Income-tax as demoralizing, or, in other words, because it offers them an opportunity and a temptation to make false returns. The remedy lies within their own power; and a rate reduced to threepence in the pound offers great facilities for the practice of truth and honesty. The Mayor of Hull complained not only that the tax was burdensome in itself, but that it fell on those who were morally and socially bound to contribute to charitable and public purposes. In other words, the Income-tax is paid by those who are comparatively rich; and this seems to be the objection taken by Canon TREVOR, who complains of the tax "as immoral in principle, because it "was a tax on a man's power to pay." ADAM SMITH "was a tax on a man's power to pay." ADAM SMITH taught that all taxes should be as closely as possible adjusted to the ability of the taxpayer, or to his power to pay; but the great teacher of political economy was not exclusively a philanthropic moralist. The adjustment of the tax to the power to pay "leaves out all "considerations of a man's obligations to religion, charity, "family, honour, and kindness." It is too true that a hard-hearted Legislature has deemed that taxpayers in common with the rest of mankind should be just before common with the rest of mankind should be just before they are generous. Private creditors, as well as the nation, are too much in the habit of exacting their dues without considering the obligations of their debtors to religion, honour, and kindness.

The deputation expressly repudiated any desire for the essening of the tax on small incomes, "because they felt that extension of remission real configuration and the extension of remission real configuration." that extension of remission was confiscation and became pillage." The principle of confiscation and pillage has always been recognized in the exemption of the smallest incomes, nor would there be any further violation of principle in the elevation of the present limit of taxation. The objection would be wholly removed by the uniform exemption of a certain amount of income without reference to the wealth or poverty of the possessor. If the tax began with 300l. a year, an allowance would be roughly made for the indirect taxes which are paid in small or large households; and although the relief to the owners of large incomes would be comparatively inconsiderable, the anomaly of an arbitrary line of division would be greatly diminished. If the recipient of 300l. were exempted, it would be reasonable that 500l. should be charged as 200l., and 1,000l. as 700l. Incidentally some relief would be afforded to the sensitive consciences of the smaller tradesmen; and perhaps Mr. DISRAELI and Sir STAFFORD NORTH-COTE might appreciate the pleasure of co-operating with the virtuous aspirations of the Income-tax League.

PRINCE BISMARCK'S FOREIGN POLICY.

VON JOKAI, a distinguished Hungarian writer, has been favoured with an interview with Prince BISMARCK, and has revealed the general tenor of what the

and he has drawn a picture which will not easily be forgotten of his host seated in a room furnished with a few chairs, a deak, an iron chest, and an iron couch, smoking an enormous meerschaum and dangling lead-pencils as big as walking-sticks. As M. von Jokat was a Hungarian, Prince BISMARCK naturally began by offering his views on the situation of the Austre Hungarian Empire. That the existence of the dual government is the best thing for both countries, that the disruption of Austria would produce anarchy in Eastern Europe, and that the Germans and Magyars alone among the nationalities subject to the Austrian Crown have the faculty of governing, were truths indisputable and palatable, but also familiar, to the hearer. Prince BISMARCK trod on fresher ground when he proceeded to speak of the trod on fresher ground when he proceeded to speak of the relations of Germany to Austria. There is in many minds an uneasy feeling that Germany hankers after the German provinces of Austria. Prince Bismarck invited his visitor to take note that no misconception could be greater. Germany has not the slightest wish for these Austrian provinces, and any German statesman who would oven accept them as a gift ought, in Prince BISMARCK's opinion, to be hanged. As to going to war for them, he himself would much rather go to war to avoid having them. It is not the interest of Germany to have having them. It is not the interest of Germany to have them. They would be worse than useless to her, and would only add to her difficulties. A few more millions of population addicted to "pilgrimaging and that sort of thing" would be the last thing that Gorman statesmen in the midst of their present ecclesiastical difficulties would desire. They have quite enough on their hands with Alsace and Lorraine and North Schleswig, and do not want any more reluctant subjects of the EMPEROR to manage. Vienna too, highly important as the chief city of the countries bordering on the Danube, and destined in that capacity to be a centre continually greater of life and commercial activity, would be worthless as a mere border-town of Germany. These reasons therefore, the validity of which M. von Jokai could scarcely contest, as their force depended on the considera-tion of what would pay Germany best, and was not weakened by any admixture of consideration for others, had made Prince BISMARCK determine that Austria should continue to exist; and, having got so far, he also determined that she should exist if possible as a strong Power, able to do the work allotted her. The policy of Germany, so long as Prince BISMARCK directs it, will be to uphold Austria. Whoever, he said, attacks Austria will have to reckon with It is seldom that a declaration so important to Europe has been made so accidentally and in so informal a manner. Whatever rumours might be flying about of schemes of aggrandizement framed by Russia in complicity with Germany, sober judges of the policy of nations as determined by their permanent interests would be slow to believe that any German statesman would allow the control of the Danube to pass out of German hands. But now there is a positive declaration by Prince BISMARCK which is better than many arguments. Whoever attacks Austria and Hungary will have to reckon with Germany.

Prince BISMARCK was equally explicit about Russia. course it is Russia that a Hungarian dreads, and it is Russia of whom a German statesman is thinking when he says that an assailant of Austria will have to reckon with Germany. Prince BISMARCK took credit for having done much to bring about friendly relations between Austria and Russia. As Germany wishes to be on good terms with both, Germany must wish that they should be on good terms with each other, and as a means to the desired end Prince BISMARCK had promoted the visits of the three EMPERORS to each other, and had laid the foundations of an alliance by which each should proclaim and be pledged to give effect to a sincere desire for peace. But it is not much in the manner of Prince BISMARCK to dwell on alliances and professions of peace. He looks at the permanent interests of nations, and at the character and general policy of those who have to uphold them. The first question he has asked himself is whether it is the interest of Russia to get Galicia, and he has decided that it is not. He has even come to the conclusion that Russia would not know what to do with Constantinople BISMARCK, and has revealed the general tenor of what the Prince said to him. He had nothing to do but to listen while the Prince discussed one subject after another with a total absence of reserve. The visitor remembered, however, that the world would be glad to know what the famous Minister was like to look at, and what were his surroundings, almost as much as to hear what he said; N3.

Busians. The special instance which Prince BISMARCE selected was that of the German subjects of Russia. There was a time when it was thought that Germany in the flush of its French victories would make an effort to reclaim symans of the Baltic provinces. Such a notion is entirely foreign to Prince BISMARCK's policy. He does not reject to the German subjects of the CZAR being Russianized the ground that they are persons in whom Germany is bound to take an interest. He appears quite indifferent to their fate, so far as Germany is concerned, but he thinks that ia is making a mistake, and this because of a very peculiar characteristic of the German race. So long as Germans live in a foreign country as Germans, they retain all the German virtues; but directly they become like the foreigners with whom they live, and cease to be German, all their German virtues go out of them as if by magic, and they are more vicious than the most vicious of their foreign models. This pernicious lapse from proper principles might, however, not be discovered in persons of other nationalities, and the Russians might safely calculate that the inhabitants of Constantinople would not become much worse whatever happened to them. It was a much more cogent argument when Prince BISMARCK asked his auditor to observe that Russia has at present got quite enough on her hands without seeking to stir up a European war by grasping territory on the Danube; and the Prince's personal knowledge of the CZABEWITCH was intimate enough to enable him to state positively that the heir of the Russian Empire is "a most "domestic" person, who is not at all likely to trouble himself about the wishes of Peter the Great. M. von JOKAI managed somehow to get in a word at this point, and mildly suggested that if Russia was so wonderfully pacific she might perhaps be induced to give up her habit of stirring up disaffection among the Slavonic nationalities of Hungary. Prince BISMARCK replied that this process of intriguing with the subjects of neighbouring States was merely an amusement of the Russian Ambassadors at Constantinople, who loved fussing, and wished to make them-selves as great men as possible during their tenure of office, while the real Russian policy, the policy of St. Petersburg, was quite another thing and was remote from the sphere of such intrigues. Probably M. von Johai was not entirely convinced by this explanation; but it is true that since a good understanding between Russia and Austria has been brought about these intrigues have been, at least temporarily, suspended.

Passing to the more general aspects of Gorman foreign policy, Prince BISMARCK declared that there was not an inch of ground anywhere that Germany coveted in any direction, and that what she had annexed had been taken for purely military reasons. It is foolish to trust even the frankest of politicians, and we may be sure that if Prince BISMARCK had been coveting any new territory he would not have let his Hungarian friend into the secret. But he would scarcely have gone out of his way to make a positive statement that desire for more territory is not a part of his aspirations for Germany, and if anything can be said positively of a foreign nation, it may be said of Germans that they have not in the slightest degree the lust for territorial conquests, and that so far Prince BISMARCK was but the interpreter of the minds of his countrymen. To get a little bit here and a little bit there, to awaken the hopes of nationalities, and to pursue other portions of the Napoleonic policy, is totally out of Prince BISMARCK's line. His aim is to hold what he has got, and, strengthened by a Russian and an Austrian alliance, to keep France and the Pope down. These are the true objects of his hatred and alarm, and certainly when he does not mince matters to telling of hate people, he does not mince matters the talking of them. His language about the Pors was such that M. VON JOKAI does not venture to print it; and as to the French, his language was strong enough to awaken some curiosity to know what stronger phrases he could have found for the Pope. If you scratch the surface, he declared, of a French barber or cook, you immediately come upon a pure Red Indian savage. What made this observation more remarkable was that it grew out of the mention of the annexed district of Lorraine. Germany actually for military purposes has had to burden itself with a lot of these Red Indians, and to treat them as entitled to share the glorious privileges of real (ferman subjects. If this is the way in which the Prince speaks, and lets all the world know that he speaks, of these new subjects of the EMPEUOR, it is not strange that they do not much love him. There is a point at which frankness

borders on brutality, and Prince BISMARCE, like HERMARE, is a German. In the German character, and especially as seen in military and official life, there is a vein of hardness and coarseness which goes far to mar the effect of high moral and intellectual qualities, and tends necessarily to pervert the judgment of those who give it play. The words of Prince BISMARCK are the words of atrength rather than of wisdom, and strength apart from wisdom is more interesting than satisfactory as a counsellor.

THE BENGAL FAMINE AND THE INDIA OFFICE.

T is easy to foresee that, unless proper means be taken to prevent it, an unreasoning and probably unreasonable outery against the Government of India will shortly arise. One or two journals stand prepared to encourage it, and we fear that it cannot be long before they are able to use the miserable certainties of famine to give point to their denunciations. Under these circumstances, it behaves the India Office to take timely measures for putting the public in full possession of the history and present state of affairs in Bengal. Parliament will meet next week for despatch of business, and it is to be hoped that the first instalment of "Papers relative to the Famine in Bengal" presented as soon as possible afterwards. No doubt there is much to be said against the system of taking the public into the confidence of the Government at so early a stage. The papers will provoke a good deal of careless criticism and many foolish suggestions, which will at once be telegraphed to Calcutta to irritate hard-working officials and give occasion to more ignorant comments. Why, the India Office may ask, should we be expected to minister to this Office may ask, should we be expected to minister to this kind of annoyance and give men more to bear who are already burdened up to their full strength? The answer is simple. The evil which will result from the publication of official news will be produced in a still greater degree by the publication of unofficial news. On a small scale it will be the history of the Crimean winter over again. The letters and telegrams of Special Correspondents will gradually take a darker and more condemnatory hue. It will be assumed in England that a Government which says nothing has nothing to say for itself. Public indignation will be increased by every fresh itself. Public indignation will be increased by every fresh arrival of bad news from the seat of famine, and before very long all possibility of securing a fair hearing for the accused officials will be at an end. They will be supposed to have merely constructed an ex post facto case in order to cover their own shortcomings, and the only form the controversy will take will be in what proportions their deserved punishment shall be meted out to them. What is needed is that the real facts should be laid before the country while it is still calm enough to review them fairly. It may be that the Government of India or the Government of Bengal has made mistakes. It may be that their estimatesof the work to be done were founded on too favourablecalculations of the wants to be supplied. It may be that they hoped when, as the event has proved, it would have been wiser to despair. These are the worst charges that can be brought against them with any show of probability. If they can be completely disposed of, now is the time to dispose of them. If they must be in part admitted, now still more is the time to admit them. Any errors of judgment which these Governments may have committed will now be taken for no more than they are really worth. Hereafter they may be condemned with scarcely less severity than if they had been acts of wilful murder. It is not a question whether to keep the public ignorant and therefore quiet, or informed and therefore troublesome. Information will come anyhow with half-adozen Special Correspondents in the field-and even Lord DALHOUSIE himself would hardly have shot a Special Correspondent in time of peace. It is only a question between keeping the public completely informed and therefore capable of judging the facts with some degree of fairness, or imperfectly informed and consequently liable every moment to go off on wrong scents, and to lay the blame on innocent heads, or to lay an unfair weight of blame on heads which are not quite innocent.

There seem to be five points which it may be useful for the Secretary of State for India to have completely sifted in the earliest batch of papers. First of all, there is the non-prohibition of exports. It may be said that the Viceror's minute on this subject is sufficient, and that the practical interest of it has already passed away. But so many

persons have committed themselves against Lord Norma-BROOK'S view that it is likely to be hotly discussed for some time to come. "Public opinion," said the Times some days back, "spized as by intuition upon the fact that not a ton "of grain ought to be allowed to leave Bengal." In a matter of this kind it is impossible to place too little faith in public intuitions. They may be valuable in questions of sentiment or honour, but upon questions involving the offect of this or that policy upon the food supply of a province they are next door to worthless. Ltill it is much to be desired that the public should be disabused of them before time has given them the sanctity of axioms, and for this purpose full materials for coming to a conclusion which shall rest on something better than intuition ought to be made accessible. Lord NORTHBEOCK'S minute would have carried more conviction than it did if it had been accompanied by Sir George Campbell's reasons for taking a different view. Taken by itself, it seems to settle the controversy; taken in conjunction with Sir George Campbell's arguments, it would probably show an overwhelming balance of argument on the side of non-prohibition; but so long as it is known that an Indian authority of such weight as Sir George Campbell dissents from it, while it is not known what are his reasons for dissenting, there will be room for doubt. We believe that Sir GEORGE CAMPBELL's arguments will be found not to cover nearly so much ground as the VICEROY'S, and that the wider survey of facts has rightly overruled the narrower survey. But this is a matter which can and ought to be put beyond the range of mere speculation.

The next point on which information is needed is the relation between the amount of food purchased by the Government and the amount of food likely to be needed by the population of the famine districts. This is a question of immense practical moment, because, if the provision already made by the VICEROY is incomplete, there is still time to supplement it. We want to know two things which are certain to be confounded hereafter if they are not made clear while it is still possible to keep them distinct. first is whether the provision of food is adequate to the need so far as it was reasonably possible to estimate it beforehand. The second is whether the provision of food is adequate to what the need has turned out to be. The first is important for the justification of the Go-vernment of India; the second is important for the It is quite possible guidance of the Home Government. that Lord Norrhibook may have bought all the food which up on the most careful and authoritative estimates seemed likely to be needed, and yet that the famine, now it has come, threatens to outstrip the most extravagant calcula-If the publication of these estimates is postponed 1 mutil the one thing that people can take note of is their insufficiency, it will be impossible to secure fair consideration for the plea that, when originally made, they seemed to err, if at all, on the side of exaggeration. A further point of great importance is the character of the food thus provided. It is said that while wholesome rice has been exported from Bengal, unwholesome rice has been imported; that instead of the Government purchases having been made on the spot, they have been made in Burmah, and that the rice thus obtained will inevitably intensify the diseases inseparable from famine, and even generate diseases which would have been prevented by the use of home-grown grain. There must be data obtainable by which to determine how far this is true, and, if it is true, the Government of India must have had some reason for refusing to buy on the spot. They may argue that nobody in England will be foolish enough to suppose that they bought unwholesome rice just for the pleasure of the thing; but in that case they underrate the capacity of public credulity when it is not restrained by facts set down in black and white.

The fourth point is the organization of the transport system. Here, we confess, the complaints against the VICEROY seem to rest on better foundation than any of those already mentioned. The case against the Government is very fairly stated by the Correspondent of the Daily News. "If Government was so convinced of the "inevitability of a famine that it was justified in purchasing "relief supplies, equally would it have been justified in the "timely organization of a system for their transport and distribution." We do not say that there may not be a flaw in this inference, or an error of fact in the implied premiss on which it rests. There may have been good reasons why the transport system should not have been organized at the same time as the food was bought; or it may not be true that everything has not been done which it was pessible to

do to provide for its distribution when bought. The however, are doubts which admit of being satisfactoris way of organizing the transport system when the work was taken in hand, and how far it was complete by the time the need which was to test it arose. The failures of the system may be exaggerated, the difficulties which have caused them may be insurmountable, or the officialing may really have been overtaken by the famine before they had got their machinery into working order. If either of the first two suppositions is correct, it is well that the truth should be made public while there is still a chance that it may get a hearing. If the last is the true one, the Government of India had better make a clean breast of it before the disposition to hold them responsible for natural obstacles, as well as for official shortcomings, becomes altogether ungovernable. The last point is the application of the relief test. Certainly there is no need to keep thousands of Bengalese labourers in idleness so long as there is useful work for them to do and they are physically able to do it. The charges made in England are that others than labourers are employed, that they are or will be employed when they are too weak to work without submitting to great and needless suffering; that when they do work they are not paid regularly and fairly; and that the work given to them, instead of being of the nature of real public improvements, is only a sham spooning of earth from a place where it is missed to a place where it is not wanted. These accusations are at least intelligible, and the Secretary of State must already have, or at any rate may easily obtain, ample means for determining whether they are true or false.

THE DUKE OF BROGLIE AND THE LEFT CENTRE.

THE French Ministry has lately been giving unexpected signs of uncasiness. The newspaper which specially represents the views of the Duke of Broglin has appealed to the Left Centre to make common cause with the Government. This step seems to have nothing in common with the similar desire not long since attributed to the Duke DECAZES. The object in the latter case was to effect a union of the Contres which should enable the Ministry to disregard the opposition of the Extreme Right. The object in the present case is to attach the Left Centre to the majority without alienating the Extreme Right. The idea which was alleged to be in the FOREIGN SECRETARY'S mind involved a modification of Ministerial policy. The idea which is now in the PRIMEMINISTER'S mind involves nothing of the sort. The appeal of the François to the Loft Centre is an appeal to certain wandering and Conservative sheep to return to their true home. If they will come back, they shall be treated with greater kindness than they deserve. Not only shall all their wicked votes against the Government be forgiven them, but one or two of the least sinful of their number shall even be admitted into the Cabinet. After all, says the Français, they are honest at heart; they are men of substance and moderation; they hate and fear the Radicals as much, though not as openly, as the Duke of Broglie hates them. Why, with all these solid grounds of agreement, will they insist on holding aloof from the great Conservative party?

It may be assumed that the recent elections for Vaucluse and Vienne are at the bottom of this curious invitation. The Duke of Brocke is not the man to go hat in hand to any section of the Opposition unless ho thinks that the need is pressing, and the chance of success promising. The election of M. LEFETT supplied the first condition; the election of M. LEDRU ROLLIN supplied the second. It mayst be clear to the Duke of Broglie by this time that one of the two barrels on which he relied for the regeneration of French politics has missed fire. The reconstruction of the Executive has not had the effect it was meant to have. It may make the path of the Government somewhat easier as regards local business, but it does not somewhat easier as regards local business, but it does not influence the elections to the Assembly. After Prefects and Mayors have done their worst, a critical election rans still be decided by a letter from M. Thisms. If the Duke of Babells had wished to satisfy himself upon this point beyond all mistake, he could not have chosen a more conclusive test than the election in Vienne. That department has been famous beyond most others for its determined and undiscriminating Conservation. So long as a candidate displaced himself an anti-Republic long as a candidate declared himself an anti-Republican it mattered little what the precise tist of his anti-Republicanism might be. The distinction between a Legitimist and an Imperialist was too fine to excite much interest in Visane. Since the war the electors have returned both indifferently. An election in such a constituency as this might have been thought—and down to the eve of the contest was thought-a certainty for the Greenment. Vienne would give another proof of its sufficiently to party names by sending a MacMahonist to take his seat by the side of a Royalist and a Bonapartist. This was the expectation; the result was that the peasants preferred to be represented by a moderate Republican, by a Republican whose principal claim to their confidence was that he was supported by M. Thiers. It was clear after this that nothing had been gained by the change of officials. Prefects and Mayors are no longer the words of power they once were. The peasantry, so docide under the Empire, have now opinions of their own, and the Duke of Brouse has not found the secret of enlisting those opinions on his side.

There is nothing left to do therefore but to try the second harrel. The attempt to make the existing electorate vote in favour of the Government has plainly failed; the next step is to see what can be done by weeding the electorate.

The Committee of Thirty have at length agreed upon an Electoral Law which is expected to diminish the number of electors by three millions, and the Government hope that this will immensely weaken the Republican party at a general election. A Reform Bill of this kind stands on a somewhat different footing from other measures recom-mended to the acceptance of the majority. It can scarcely be other than unpopular with the electors whom it strikes off the register, and it is hard to say how far this unpopularity may influence the electors who remain on the register. Other measures may be forgotten in the excitement of a general election; but a law which prevents three millions of men who have heretofore voted from voting any longer is necessarily brought into especial prominence at election time. There are some weak-kneed brethren in every majority, and to mon of this stamp the prospect of having to appear before their late constituents and justify a vote which has helped to disfranchise a large portion of them will be exceedingly unpleasant. On the most favourable calculation a good many Conservatives will be included among the rejected voters, and even the thought that their own loss will be their party's gain may not reconcile them to the implied degradation. If their natural irritation extends to their more fortunate friends, it may go very hard with a candidate who has supported the Electoral Law. Speculations of this kind are probably common among the Ministerial majority in the Assembly. It is painful to think of deserting the Government; but then it is more painful still to think of being deserted by the electors. It may even be argued that regard for the Government does not compel a deputy to vote in a way which would put his return to the Assembly in peril. If the Conservatives who vote for disfranchisement are not elected to the next Assembly their place will be taken by Republicans, so that the Duke of Broule may, after all, be better served by those who oppose the Electoral Law or stay away while it is under discussion than by those who give it an injudicious support. It is hard to forecast how many there may be in the Right Centre and even in the Right itself who will be influenced by these considerations, and it is this uncertainty perhaps which has driven the Duke of Broche to make overtures to the Left Centre. If they would come over to the majority, its numerical strength would be so great that it could stand a large percentage of doubtful votes without its supremacy being put in peril. The election for Vaucluse came in conveniently by way of text for the Duke's sermon. The Français has been discoursing in an edifying strain on the terror and disgust which the return of M. LEDRU ROLLIS must inspire in all the return of M. LEBRU HOLLIS must inspire in all moderate Republicans. Do not the Left Centre see that by holding aloof from the Government they play into the hands of Radicals and Communists? When the hanner of social order is once in the field, all who do not rally to its support are virtually aiding the enemy. There is no middle term between Marshal MacMahon and M. Lensur That Left Centre must choose which entered ROLLIN. The Left Centre must choose which extreme they prefer, or rather they must decide whother, by choosing neither, they will really choose M. LEDRU ROLLIN.

The deputies of the Left Centre show no sign of being with over by this reasoning. An organ of the Extreme, Right has supplied them with an argument on which to ground their refusal. The Monde declares that the Duke

some in an opera where tenors and baritones, arranged in a circle, sing for a whole hour that they are going to defend their country. What is it, asks the Ultramontage journal, that the Duke of Brootis is going to defend? This is precisely the feeling of the Left Centre. They have good reason to knew that it is the Duke of Brootis and his friends who give the Radicals their only chance in the country. When the moderate Hepublicans were in power it was the concessions to the reactionary majority extracted from M. Thiers that secured the election of M. Baropet for Lyons, and the other day the only pretext BARODET for Lyons, and the other day the only pretext that the extreme Republicans found for bringing forward M. LEDRU ROLLIN as a candidate was the necessity of making a demonstration against any tampering with universal suffrage. The Left Centre have, in fact, absolutely nothing to gain by a coalition with the Government. They see their own ideas daily gaining strength in the country. They are persuaded that the majority of the electors are everywhere with them; that their leader is still the most trusted man in France; that if the Assembly were dissolved, nothing but military violence could prevent his being placed at the head of affairs, either as First Minister or as President. Supposing that they were to listen to the Duke of Bround's invitation, what would be the result? The profound distrust which his participation in Monarchical intrigues has everywhere excited would be in no way lessened. He would still be regarded as merely biding his time to put the Count of CHAMBORD or the Count of Paris on the throne. But the electors who now have confidence in moderate Republicans might begin to doubt whether the Radicals are not right when they tell them that moderate Republicans are no better than disguised Royalists. A few of them would probably turn Rudicals in consequence, but the great majority would be more inclined to think that all politicians are regues, and that they had better full back into their old attitude of entire abstention from public affairs. This is what would happen if anything happened. It is more probable, however, that nothing would happen beyond the rejection at the next election of the deputies who had shown themselves so blind to all the evidences of public opinion as to desert the winning side when its victory was almost assured. Neither hypothesis can have any charm for the Loft Centre, and unless the Duko of BROGLIE can make them as short-sighted and as panie-stricken as himself, they are not likely to regard his overtures except in one of these aspects.

RAILWAY PROPERTY.

THE February dividends of the Railway Companies caused much disappointment to abareholders; for, although it was known that the working expenses had been extraordinarily heavy, the weekly traffic returns had throughout the half-year shown a large and unfailing increase. Without a minute knowledge of the transactions of the different Companies it is impossible to form a confident opinion of their condition at any time as compared with the corresponding part of the previous year. In the autumn of 1872 the price of coal was repidly approaching its highest point; and the simultaneous rise in wages and in the cost of materials deprived the Companies of much of the advantage which they might have anticipated from the prosperous activity of trade. It is only after an interval that a rise or fall of prices produces its full effect. Many contracts which had been made before the great advance in the price of coal were still in operation during the winter, and even in the spring; and probably it will be found that, notwithstanding the late fall in the coal market, the rate paid during the current quarter or half-year will have been as heavy as in 1873. In some exceptional instances the increased conveyance of coal on the railway has more than compensated for the additional cost of fuel. The Monmonthshire Company declared a few days ago a dividend of eight per cent., while the amount for the corresponding half-year had been only six per cent. The North-Eastern Company also obtained a fractional increase of dividend, which may perhaps have been partly due to the coal traffic. The Midland Company, on the other hand, notwithstanding its with over by this reasoning. An organ of the Extreme large London coal trade, suffered a reduction of one per cent. Right has supplied them with an argument on which to in the dividend. The improvement of one per cent in the ground their refusal. The Monde desires that the Duke Caledonian dividend may perhaps be explained by the of Bucellu's appeal on behalf of moral order resembles a reduced accommodation which has been provided for

passengers, in consequence of a compact which was formed several months ago with the North British Company. The published traffic returns only supply a rough indication of the profits which are realized by the Companies. Although the total working expenses may be for considerable periods almost stationary, some kinds of traffic are temporarily, if not permanently, unremunerative, although the proceeds are included in the gross returns. The periodical statements of the receipts and expenses of the Manchester, Sheffield, and Lincolnshire Railway are not imitated by other Companies.

Within two months the value of shares has been largely reduced, to the vexation of holders and with a heavy loss to sellers; and the deterioration has within a week or a fortnight proceeded at an accelerated pace. Declining or stationary dividends have perhaps been the principal cause of the fall in the market; but purchasers and vendors naturally regulate their dealings with reference rather to future prospects than to the actual condition of railway property. For two or three months money has been abundant at an casy rate of discount, but the decline in the price of shares has been uninterrupted. The Board of Trade returns may account in some degree for the unfavourable anticipations of speculators. There can no longer be any doubt that commercial prosperity has received a serious check, and that the effect of dulness will be felt by the Railway Companies both in goods traffic and in the number of passengers. It can scarcely be said that the result which may be expected has already occurred. The weekly may be expected has already occurred. The weekly traffic returns, with few exceptions, exceed those of the previous year, which had been hitherto the largest on record. It is true that the rate of increase is lower; but it is a curious illustration of the confidence of popular judgment that a diminution in the speed of progress is instinctively regarded as the commencement of retrogression. On the Turf, a horse which is gradually overtaken by the rest of the field is by a picturesque paradox described as "coming "back to his horses." He may perhaps still be approaching the winning-post at twenty or thirty miles an hour, but his relative decline of speed presents itself to the excited areas as a healtward motion. For a similar reason a spectator as a backward motion. For a similar reason a railway which carned 8,000l. a week more in March 1873 than in March 1872 is supposed to have a diminished recoipt if in the present month its weekly increase, as compared with last year, is only 2,000l. The true effect of the statement can only be appreciated when the working expenses as well as the gross amount of traffic are ascertained.
Companies which have the opportunity of communing new contracts will now be able to obtain their coal at reduced prices. There is unfortunately reason to fear that the prices. general traffic may soon begin to decline.

If the amount of traffic, as compared with that of last year, is not reduced, the dividends of at least the second half of 1874 can scarcely fail to improve with the reduced price of coal. At a somewhat later period several of the Companies will begin to derive a considerable income from the new lines which at present form a mere charge on the revenue. In consequence of a perverse and arbitrary rule established some years since by Parliament with the avowed purpose of discouraging railway extension, Companies are prohibited from paying interest on the capital which they raise from any source except their earnings on their completed lines. The interest on capital during construction is as legitimate a charge on any undertaking as the wages of workmen or the cost of rails; nor would any private speculator hesitate to make the convenient arrangements which are forbidden to Railway Companies. The consequence of the vexatious state of the law is that new Companies are compolled to pay enormous interest to contractors, instead of simply raising money in the market, and that existing Companies pay out of the proceeds of one line for the cost of another. The fashion having recently changed, the clamour for new works is raised by the same class of theorists which formerly insisted on the abound policy of closing all capital accounts. sisted on the absurd policy of closing all capital accounts. Parliament will consequently be inclined to relax former restrictions; but in the meantime the sacrifices which shareholders have incurred will be partially rewarded as their barren outlay becomes gradually productive. The Great Eastern Company has already begun to use for some purposes its costly extension to Broad Street. The Great Northern, the Midland, and the Sheffield Companies have opened their joint line to Liverpool, though their traffic there is still insufficiently accommodated. In the course of 1875 the Midland Company will, by the opening of the

Settle and Carlisle line, bring over its system a vast amount of Scotch traffic in return for an expenditure of two millions which has hitherto been a dead weight on the revenue earned by the existing lines. Railway policy has on the whole been sagaciously directed, and the most enterprising Companies, not having prematurely closed the capital accounts, have now the brightest future prospects.

Careful observation of the constant changes of the market will show that prices are influenced by many circumstances which have little counexion with the intrinsic value either of railway securities in general or of particular stocks. It is only in the long run that purchases for investment regulate the figures of the share list. The bargains of speculators, which are virtually bets, purport to apply to millions, while the modest investment of savings laboriously accumulated is represented perhaps by thousands. The relation of supply to demand depends chiefly on the operations of large dealers, who are, like other speculators, generally interested in producing abundance or scarcity of the commodities in which they deal. The ordinary stock of the railways of the United Kingdom is nominally worth twenty or thirty millions less at the middle of March than it was at the beginning of January; but it may be confidently asserted that the property of holders who have no occasion to buy or sell is affected in a far smaller proportion. As long as the weekly traffic receipts are slightly increased, or even not diminished, shareholders have no serious reason for alarm. Purchasers who can rely on their own judgment, or on the opinion of competent advisers, will find a great advantage in exercising a careful discrimination between different undertakings. Some railway systems have approached more nearly than others to the full development of their traffic; and competing lines now in process of construction will shortly compel some Companies to share a portion of their gains with new competitors. It has been already remarked that unproductive capital will in many instances shortly return a profit to the owners; and it is in almost all cases desirable to prefer in the selection of investments an undertaking in which debentures and preference shares bear a high proportion to the ordinary stock. The Great Western Railway stock has within seven years been multiplied in value threefold, because the ordinary shareholders have realized the increase of profit on the entire capital. The value of London and North-Western stock has in the same period risen in value between thirty and forty per cent., although the total receipts have increased as largely as those of the Great Western Company. A comparison of present prices with the dividends of the past year shows that the shures of the principal railways may now be bought to pay about five per cent.

THE ROYAL PROCESSION.

THE Royal procession of Thursday was really a very fine sight, and it also afforded another agreeable illustration of the kindly and sympathetic relations which subsist between the Queen and her subjects. It is needless to go further for reasons to justify a graceful and interesting ceremony, and there is something grotesque in the elaborate and subtle apologies which some of the newspapers have thought it necessary to offer. The Times has discovered in the demonstration not only a grave declaration of constitutional loyalty, but an act of homage to the newspapers which have cultivated the "activity of intelligence" which is supposed to have been displayed in the curiosity to see the procession. The people who waited all the morning in the snow were, no doubt, very glad to see the Queen and her young daughter-in-law, and there can be no question as to the sincerity of their greetings; but there is no reason to assume that they were animated by severe logical convictions as to the absolute perfection of a particular form of government, or that they passed their time in expressing profound pity and contempt for all Frenchmen and Americans. If they had thought about the matter at all, they would no doubt have told themselves that they were extremely well satisfied with the institutions under which they lived; but it is not unreasonable to suppose that they took those institutions very much for granted, and that their immediate object was to gratify a simple and natural curiosity. Whatever leading-article writers may say, there are few persons who troube their heads on a holiday with thinking of the fundamental principles of government; nor is it probable that much time was devoted to devote the circum-

stance that "the Cran's position in Russia is more than "human." It is more likely that what the people were really thinking of was that it was very cold, that snow is more postical in a picture than in reality, that a sunny day would have been an improvement, but that in any case the ects looked very bright and pretty, and that it was not my day they had a holiday and a chance of seeing the Queen, both of which were very nice things. A holiday is Quent, both of which were very nice things. A holiday is an innocent and wholesome enjoyment, and a break in the dull round of ordinary life does not occur by any means too often. Quite apart from any deep political considerations, such demonstrations have their uses in stirring up the popular imagination, in giving dull, stagnant minds something to think about, and in providing an entertainment which all classes can share in common. A great city like London could not afford to be common. A great city like London could not afford to be often interrupted in its labours by Royal processions, but its inhabitants are none the worse for being reminded at intervals that there is something else to be done besides The decorations of the streets may not be making money. very admirable from an esthetic point of view, but at least they show public spirit, and may perhaps be regarded as a passing gleam of poetry in a prosaic and commonplace existence. There is nothing in the simple and honest enjoyment of a good show to be ashamed of or to require ingenious excuses. It is an old and natural instinct which preceded the cultivation of human intelligence by daily newspapers, and has happily survived it.

It is possible that if there had been no change of Government the Queen and the Duchess would have come to town as they did, and that everything would have gone off just the same. Yet it must have struck many who have witnessed similar spectacles in recent years that there was a completeness and handsomeness about the arrangements which marked another order of mind. Instead of a paltry guard, there was an imposing body of troops on the ground, and the troops were picked regiments of whom any nation might be proud, and who were regarded with much interest by the public. What, however, seemed to please the people most of all was the slow pace at which the Royal carriage passed along. They were not tantalized, as on former occasions, by a flying glimpse, but could take a good leisurely look at the QUEEN, and carry away a distinct impression of her appearance. They were also gratified by witnessing something of the state which in the popular idea ought to surround the sovereign of a great country. It is obvious that if these sovereign of a great country. It is obvious that, if these things are to be done at all, they ought to be done hand-It is obvious that, if these somely and graciously, and this was the peculiar merit of Thursday's proceedings. As the troops fell in behind the Royal carriages a long and brilliant cavalcade was gradually As the troops fell in behind the formed, and without superfluous or garish pomp, the dignity of the Sovereign was becomingly maintained. It is true that monarchy, even a limited monarchy, is not a mere matter of decoration; but it is not desirable that the decorations which help to give effect to the symbol should be dispensed with. The Count of Paris is now paying the penalty for his grandfather's shabby coat and gingham umbrella. If Sir Charles Dilke happened to be a witness of the procession, he must have had an opportunity of discovering the error he committed in imagining that there was any desire on the part of Englishmen that there was any desire on the part of Linguistanto effect a paltry saving by stripping the fringe and gilding from the throne. As far as there was anything approaching to discontent in the popular mind, it had its origin in a feeling that the Sovereign had perhaps become too much of an abstraction, and that was wanted was more and not less of royalty. It is idle, as Lear told his daughters, to reason down the magnificence of State to common needs, and there is a certain degree of external splendour which is appropriate and decorous in the high places of life, and which, even by the test of utility, is justified in its object.

While the authorities made the necessary arrangements for the procession, the decoration of the streets was wisely and properly left to private enterprise, and was undertaken with much liberality and the heartiest goodwill. The profuse adornment of some four miles of streets must have cost a considerable sum of money, and the result was no doubt gay and brilliant. It is impossible, however, not to regret that the artistic value of this part of the show should have been se small, and that the householders in each street did not co-operate more effectually in doing justice to their opportunity. If the same expanditure had been applied to a

comprehensive plan, something might have been produced which would have made the scene extremely beautiful and impressive. In some instances there appear to have bean committees at work, but they were possibly not invested with sufficient authority, and isolated individual effort was conspicuously in the ascendent. The onlinery run of devices was commonplace and monotonous stripes of black and yellow, double-headed eagles, monograms and mottoes, festoons of paper flowers, hedges of evergreens, miles of crimson cloth, and clouds of bunting of every shape and hue—all this repeated over and over again in dislocated confusion. shape and hue—all this repeated over and over again in dislocated confusion. The general effect was spoiled by attention being too exclusively paid to the appearance of each house by itself, and was necessarily crude, spotty, and incoherent. Flat-fronted brick houses, broken up by shop-fronts in every variety of design, supply an awkward subject for artistic treatment; and the only way of dealing with them satisfactorily is to suppress individual eccentricities and to make the most of broad outlines and long porspectives. If the route had been taken in hand in this spirit tives. If the route had been taken in hand in this spirit and decorated with a view to large effects, a really noble result might have been obtained, and probably with less trouble and at a smaller cost. The sustained reproduction of a general design and the harmonious management of details would have made a great picture for the eye, which, as it was, was dazzled and wearied with an endless mass of broken colours. The decorations at the top of Regent Street were scarcely bold or substantial enough for the space to be filled up, and the huge plaster statues at the lower end were vulgar and unmeaning. The Crimean monument, hidden in flowers, happily represented one of the sentiments of the day. On the whole, the demonstration was very pleasant and successful in spite of the Must vite weather. It was a pretty show, and was well received, and helped to freshen and exhibitante the rather dut and jaded life of a great site. city.

FACT AND FICTION.

W ISE people have been shaking their heads for many months past over the excessive interest taken by their weeker brethren in the case now happily at an end. Some foolish people have ventured to protest against the severity of the judgment pronounced upon an indulgence which has grown habitual. They urged that, after all, a trial which brings out the characters of living human beings gives as much rational entertainment as endless discussions about the 25th Clause, and more rational entertainment than the novels which even wise people admit to be readable. Now the foolish people are of course in the wrong when they prefer any thing to solid political and economical discussions; but on the other point we fancy that they could make out a very fair case. The fact that an opinion commends itself rather to the foolish than to the wise is not by itself a sufficient condemnation. Each class has its characteristic weaknesses, though it would be tautologous to say that the wise are most frequently in the right. The wise are apt to set an excessive value upon general principles which are not always calculated for the average intelligence of mankind. Now the practice of reading records of contemporary crime has obvious disadvantages which have been too frequently denounced to require further notice. No human being can be the better, and many are much the worse, for dwelling upon the revolting details of cruelty and vice which are constantly coming to light in police reports. But this general rule may be pressed too far. It is impossible to draw the line accurately, either in history or fiction, between the stories which do and those which do not appeal to a morbid curiosity. The influence of a story in fact depends upon the reader at least as much as upon the writer; and one man may study the report of a trial for the purpose of philosophical reflection, whilst another may simply be attracted by the revelations which ought to repel him. We can only strike a rough average for purposes of comparison. Take, for example, an o

The advantages of the true story are obvious. Mr. Carlyle is fond of impressing upon us that the fact of an event having really happened is sufficient to justify a certain degree of interest in it. In one of his earlier essays he makes some characteristic comments upon this favourite text. He tells us how much he was interested by reading, in the account of Charles II.'s escape att the battle of Worcester, of the King's meeting a labourer who was going about his morning's work. There is nothing in the smallest degree remarkable about the meeting itself; and it struck in Carlyle so forcibly just begause it was commonplace. The labourer

got up that morning as he probably got up on several thousands of other mornings; he was only doing what countless of millions of his fellow-creatures have been doing before and since; and he immediately returned to the obscurity from which he came. Mr. Carlyle's imagination was impressed simply by the fact that this little island of solid truth emerged for one instant from behind the veil of mist under which so many other events of incomparably greater intrinsic importance have been hidden for ever. He is struck as the astronomer may be struck by the minute comet which looks in upon us for a moment and then retires for ever into the infinite abysses of space from which it came. So, too, we the infinite abysess of space from which it came, so, too, we may be sometimes impressed by a fragment in a geological museum. Uncounted millions of ages ago, some monstrous reptile was waddling up a bank of slime, with a dim reptilian consciousness of warmth or discomfort. Suddenly a stone falls upon him and smashes him, and his brief spark of vitality is extinguished. Ages passed on, the whole race to which the reptile belonged gradually died out, and the old order yielded place to a new And than came a geologist and found this solitary fragment. new. And then came a geologist and found this solitary fragment from the vast wreck of the past. The reptile had been singled out for immortality from the millions of his kind by the freak of fortune, when he was certainly not thinking of any such consummation; and the sight of him calls up to the remotest posterity a dim vision of the enormous past. Mr. Carlyle is never tired of pressing this thought upon us. He is always calling our attention to the little incidents which open a sudden glimpse backwards into distant ages and then dissolve into obscurity. This indeed is the to the little incidents which open a sudden glimpse backwards into distant ages and then dissolve into obscurity. This indeed is the poetical side of history, whether ancient or contemporary. The arbitrary way in which little waifs and strays of facts are preserved whilst the great mass sinks into eternal night points the old moral that our little lives are rounded by a sleep, and that history is but a narrow track across a bottomless abyss of oblivion. When Roger Tichberne disappeared from this world, he could not have fancied how strangely the most trilling events of his life were destined to be preserved to some kind of questionable immortality, and the accident which thus saves the record of one mortality, and the accident which thus saves the record of one life out of millions makes us think of the dark background to the few surviving figures.

Of such thoughts, indeed, few readers may be distinctly conscious even after Mr. Carlyle's lessons, though perhaps they partially explain the interest attaching to any stray fact simply because it is a fact. It is an expression of the instinctive pleasure of human being in finding some fragment of firm standing ground. But of course a fact needs some further interest to impress the ordinary imagination. It requires rare poetical power to enable us to feel that there is really something significant about the sudden apparition and disappearance of a seventeenth-century peasant. The ordinary mind, it may be said, must have the transforming medium provided for it; and therefore it should be induced to look at the world through the eyes even of a commonplace novelist rather than contemplate the bare fact for itself. Even a dull author gives us some kind of theory about the world, whereas the author gives us some kind of theory about the world, whereas the readers of a newspaper merely accumulate a barren set of facts without being stimulated into any train of reflection whatever.

If, for example, it is desirable that we should know what is the feal nature of a villain, we shall learn more by putting ourselves under the guidance of Fielding than by trusting to the ordinary reporter. The history of Bliffl is more significant than the history of Bliffl is more significant than the history of Bliffl is more significant. reporter. The history of Blifil is more significant than the history of Arthur Orton, because it does not merely record the arts by which villains succeed, but enables us to feel how a keen observer explains the character of which they are the fruits. When reading Tom Jones we have the essence of human life given to us by a great artist; when reading the Tichborne trial we are overwhelmed by incongruous masses of fact presented without order or moral. We are left to supply the instructive thought for ourselves, and, as a rule that is precisely what we are incapable of supplying. We a rule, that is precisely what we are incapable of supplying. We should learn more about country life in England by reading Middlemarch than by plodding through the most authentic collection of memoirs or reports, simply because we should in the first case have the advantage of George Eliot's company, and the grain would be ready sifted from the chaff. Certainly we could ill afford to put aside the assistance of the great nevelists in studying human nature. Our results would generally be very meagre and human nature. Our results would generally be very meagre and chaotic were it not that we sometimes see an idealized vision of the raw materials. But it is equally true that nobody can fairly appreciate even the best of novels who cannot compare the results with independent experience. We do not understand Fielding properly till we have checked his teaching by Horace Walpole, or perhaps by the Newgote Calendar; and Middlemarch, with all its merits, would miss its mark to readers not familiar with other sources of information about modern English life. To mest of us life runs in a very parrow groove. A man may To most of us life runs in a very narrow groove. pass for a very well-informed person on all social questions who is perhaps not familiar by actual experience with the affairs of more than half-a-dozen families, and whose social intercourse soldom takes him beyond the limits of a single section of a single stratum of society. When he reads a novel dealing with criminals and adventurers, he is quite unable to distinguish between the tacit comment and the genuine observation. He may learn from the study of Dickens or Thackery that red tape is an above to that enablishment is a probability of the substitution of that enablishment is a probability of the substitution of the s serm from the study of Pickens or Thackersy that red-tape is an abomination, or that suchbishness is an ugly phenomenon amongst the upper classes. But we may easily see from the dominants of foreign observers how very mislending such portraits of the world may be, even when they are drawn by artists of consuments ability and if the most redistic tendencies. Outsiders derive from such books a very vigorous conception of certain dements of English

society; but they are quite unable to judge of the real importance of the forces at work, and of how great or small a part they play in the actual working of life. The most abourd of fereign misconceptions might be justified by passages drawn from competent English authors; nor could we contradict them if we were limited to our own experience. We instinctively recognize their should just because our own direct observation has been supplemented by thousand inforces derived from such converse they were the converse derived from such converse. a thousand inferences derived from such sources as even reports of criminal trials.

criminal trials.

Considered as a gigantic experiment upon the gullibility latent in human beings, the late trial was really more interesting to a philosopher than many volumes of pure theorizing. The laying bare the strange method by which a gross delusion propagates itself even amongst people supposed to be intelligent, and in the face of all appliances for exposing falsehood at the time of its first propagation, is itself instructive in a high degree. Doubtless a man who confined his attention to grave political discussions would accumulate a greater number of judicious theories than the thoughtless person who wasted hours in balancing the evidence for and against the tattoc marks. But it may be doubted whether the reader of the less dignified matter would not learn more as to the actual working of human machinery. It is true that his knowledge would be of the empirical, not of the scientific, kind. Hie would not be able to extract from it any definite quantitative proposition—to able to extract from it any definite quantitative propositionobtain, for example, an arithmetical measure of the actually existing amount of folly in England, if any figures could adequately express
it. But certainly he would have gained wide experience of one
important phase of English imbecility. He would have a clearer
perception of the conditions under which certain delusions are
generated than he would receive from the volumes of many historical critics, and a clearer view of the manners of certain classes of the population than he could receive from the study of innumerable blue-books. Doubtless one element which we meet in the pages of a great writer would be absent. We should not have new revelations of the beauty to be found even in commonplace natures, or be imbued with new and elevating conceptions of man and his position in the universe. But if the comparison be made with the ordinary hack novelist who simply reflects the current opinions of the day, the advantage of reality has nothing to be set against of the day, the advantage of reality has nothing to be set against it. A vulgar, though strangely successful, series of impostures does not point any particular moral; but neither does the ordinary novel. The writer who acts as providence to his own creatures may of course claim an easy credit for distributing poetical justice. But if we do not believe in his views, the moral disappears; and if we do, we only receive a very false view of life. Facts are in that respect, on the whole, a better teaching than fiction. Sometimes they may exhibit requery successful or unpunished, but they seldom fail to exhibit the reque as a very repulsive character, which is more than can be said for many novels. Any halo of remance that may surround a said for many novels. Any halo of romance that may surround a villain is effectually dispersed by a little familiarity with criminal trials, and no writer of fiction would dare to make his fortunate trials, and no writer of fiction would dave to make his fortunate rogue so contemptible a character as the reality. He would be bound to attend to probabilities, and to give him some superficial charms of manner or sppearance. Who ever read a story in which the arch-deceiver was a grossly fat and utterly uneducated butcher? If, as we are told, sympathy with criminals is sometimes stimulated by reading reports of trials, we must admit the fact, but add that people of so morbid a constitution will certainly be in no want of equally corrupting fictions. No doubt it is more or less depressing to wade for day after day through many columns of more or less skilful lying, and the picture of human nature is taken from its most unfavourable side. People, therefore, whose whole reading is composed of such matter will be in great need of a corrective. They will require something sweeter to take the whole reading is composed of such matter will be in great need of a corrective. They will require something sweeter to take the taste out of their mouths. We only mean to say that, to a mind surfeited with ordinary fiction or wearied of the pompous platitudes of ordinary controversy, there is something almost refreshing in having for once a lively description of even an ugly, and in some sense a revolting, set of undoubted facts. We may be glad, after studying them, to turn to some kind of literature which reminds us of the existence of honesty and high principle in the world; but yet we may profit in many ways by having looked for once into a kind of life of which we should be sorry to make a closer personal acquaintance. acquaintance.

THE THIN EDGE OF THE WEDGE

THE THIN EDGE OF THE WEDGE.

A FRENCH gentleman under the old regime was once going in his cabriolet from Paris to Calais, when he was accosted by a man who was walking along the road, and who begged the favour of being allowed to put his greatcost, which he found very heavy, into the carriage. "With all my heart," said the gentleman; "but if we should not be travelling to the same place, how will you get your cost?" "Monsieur," answered the man, "seem dedans." The story goes on to add that the gentleman immediately took him into his carriage. This is a very good example of what is called the thin edge of the wedge. There are people gifted with the nesseté attributed to this asswilling indestriain who effect really difficult manouvres by putting forement trifling requests which only the surly and forewarded can status; there are vectimes of the thin edge who never feel the ground safe under their feet, or know whither the displacet assent will heat them. There are, on the other hand, people who make the possible internious of the thin edge the reason for an internation of the thin edge the reason for an internation of the thin edge the reason for an internation of the thin edge the reason for an internation of the thin edge the reason for an internation of the thin edge the reason for an internation of the thin edge the reason for an internation of the thin edge the reason for an internation of the thin edge the reason for an internation of the thin edge the reason for an internation of the thin edge the reason for an internation of the thin edge the reason for an internation of the thin edge the reason for an internation of the thin edge the reason for an internation of the thin edge the reason for an internation of the thin edge the reason the reason that the property of the reason that the property of the reason that the edge the reason that the property of the reason that the property of the property of the reason that the property of the prope

Them is indeed a thin who for overimenting itself into all human fabrics and institutions, for which no one in particular seems apparation. Nothing is permanent; few things give way all at two; but whenever a creat or a weak place above itself, there the him edge in this case is impersonal, and means ineritable change and gradual revolution. Somehody, no doubt, began at it; but he would towards the end without design as the blind instrument of fits, and has not left his mark upon it. And because nebedy observed or protested during the operation, because nebedy observed or protested during the operation of the indeed a fail prospect of its plans, but won our consent by instalments—a consent which never would have been granted had we seen where we were being carried. It may have been for our good; childron and sick people and the victims of confirmed had habits must often be so managed. The thin edge is in certain cases an essential instrument of discipline. People who have not arrived at, or are past the power of self-direction must be led step by step; when reason is not in a condition to enforce its stem dictates, they must be ensuared into the right course; and affection often inspires these gentle frauds in bosoms which never practice them for personal ends. Still it is in human nature to be planted to the process not to acquire a certain surliness and suspiciousness of demeanour foreign to his order as a sort of thing which we are instinctively on our grant at the reverse of these charms in her husband. He knows himself to be no match for her; his only resource is never to grant an inch, because it so often stretches into an ell by the mere force of logic, und

Or, if she rules him, never shows she rules ;

a predominance which can scarcely be brought about except by a judicious use of the thin edge.

Servants are apt to become great adepts in the use of this implement. It is wonderful what a weight of consequences a small concession is made to bear in some easy household where change is the one thing dreaded. Once allow this to become evident, and the master or mistress is head only in name—the real power is transferred elsewhere. An indolent master finds it much easier in each instance to yield than to resist the gradual encroachments of the man who suits him and knows his ways. A favourite maid—a treasure—by a cunning use of small and seemingly harmless requests, which the yielding temper finds it impossible to refuse, becomes virtual mistress and makes everything and everybody subservient to her pleasure and convanience. She sake to be allowed to invite one acquaintance, and a troop follow all imseparably connected by circumstances; her time has some double duty to pay which makes it obvious to the perplexed mistress that she must not complain when an hour's absence extends itself to three or four. The position of service, if we think of it, requires a subordination of private interests which needs the conscious presence of authority to keep its hold on the meind. Whenever this is unduly relaxed, personal planning must step in. A habit of scheming for private ends almost inevitably grows with the apportunity of indulging it, and the only instanment available is the thin edge. A timid or careless head of a family or household is its sure wichin.

Conservation as such, the instinct of preservation of things unfactions or are identified with our interests, makes great use of the arrument of the thin edge, more sometimes than it exactly

Conservation as such, the instinct of preservation of things established because they have twined themselves round our effections or are identified with our interests, makes great use of the argument of the thin edge, more sometimes than it exactly feels. It is a politic way of expressing dread of a touch or a shown, when we done not use the words because they would imply too great a confession of double weakness in the advocate and the cause. The only way, we feel, to keep up some cherished practices or institution is to leave it alone, consessus that it emmendates up

As an calcin initiables niv Will standshingh to this dealer heren Or as the weekent things if from Have stillped them meladies their pastwith many a time-honoured charvance. In last year's Qualities. Conference, which was hold to consider the last condition of Qualitation "as a Charch," it was proposed by some manufers to break the silence of their mostings by the public reading of the Bible. A Kentish Qualitation or the thin edge of the Bible. A Kentish Qualitation of the thin edge of the wedge," while it was further stated that some of the older Friends had threatened to absent themselves from meetings if the Scriptures were to be read, lest their meditations should be interrupted. Now of course here the thin edge was the obvious argument. Some there were who ventured to attack the proposition on its own ground of inexpediency; but the yeargar members of the community—infected with love of change, and already indulying in relaxations of the old rule of dress and thee and thou—would be more likely to be touched by an argument against the reading of the Bible, not as an interruption, but simply as the thin edge to be followed by the whole wedge of subversion this question hung the fate of Qualerism—break in upon "silence" and the fabric would collapse.

and the fabric would collapse.

This argument is the enemy of compromise. We find the leaders of strikes using it when they observe their hearers open to some planable proposal from the masters; and it generally tells. The president of the meeting has only to say that the masters are trying to get in the thin edge of the wedge in order to destroy Unionism, and he is sure to elicit cheers. No man likes to be behindhand in ponetration; he cheers to assessed himself that he had thought so all along. The thin persuade himself that he had thought so all along. The thin edge is, however, very far from boing a more figure of rhetoric. Every actively aggressive party has some diplomatic spirit among its members whose delight it is to introduce an innovation, with all the six of its being inventional and are in the large of the large invention all the air of its being immutarial and without party significance, but which, once inserted, he hammers down with his full force never, however, giving it a name till the thing is done. Nabedy says, "I will insert the thin edge." It is the office of the one side to talk of it, not always with discrimination; it is the other's business to use it under such ambush as ingenuity can devise; to put a real reason foremost—we are thinking of honourable men—but not the reason which impels them to action. There are stratagens in war which deserve the name; but it is in the war of parties in politics and especially in religion, that we see it in full play. Those whom they have the good fortune to circumvent will become, as we have said, crusty, suspicious, uncivil; but if the end is gained these are minor points—matters for amusement among partisaus, or even materials on which to establish a grievance, often a very convenient commodity in such warfare. Perhaps there is one class of sympathizers who are sacrificed in the game, but they are not the most numerous. Every strict regime, every rigorous code of manners or morals, is perpetually undergoing the asseult of the thin edge. Take, for instance, the telerance towards the atrical en-Take, for instance, the tolerance towards theatrical entertainments which has gradually superseded that horror of a play which once possessed a great religious purty. In this case the fashion of Shakspeare readings is the thin edge. To hear a celebrated actor read dramatically, accompanying his words with such appropriate action as was compatible with a sitting posture, offered no salient point for scruple or objection; the matter being unobjectionable, why not give it with offect? And yet, after a hearing, the scrupulous listener found himself deprived of half his arguments accing the playbours. his objections remained but some ments against the playhouse; his objections remained, but something of his power was gone as an authority, even in his own estimation, much more with his followers. This, however, is an interest of the impersonal inevitable working of change. Time is instance of the impersonal, inevitable working of change. Time is the great labourer in this direction, ministering as he does to that veariness of long subjection to the same thing which posses humanity, along with the difficulty which the masses find in effecting their emancipation at a stroke.

A ROMAN CATHOLIC GRIEVANCE.

WE have just lighted on a form of "the religious difficulty" which we certainly should never have looked for beforehand, though perhaps it throws some light on a piece of abortive legislation in the last Parliament. The new number of the Month contains a statement of "a grievance to Catholics" which shows how wonderfully thin-skinned some theological partisans are, and which also shows what unpleasantly stubborn things facts are sometimes found to be. A correspondent who signs himself "One of an Old School" writes to the Editor of the Month to complain that the Vision of Piers Plowman is set as a subject in the examination in English Literature in the University of London. We could hardly conceive the possibility of an examination in English literature which should not take in the Vision of Piers Plowman. But in the eyes of the correspondent of the Month—we are not sure whether we ought to add in the eyes of its Editor—the presence of the Vision in an examination is "a grievance to Catholica," a "bardship," an "ambuscade for the faith of Catholic youth." "It is intolarable to propose as a book to be got up, a work which is full from beginning to end of satire against the religion of many of those who are to be examined." The correspondent is plain-spoken those who are to be examined." The correspondent is plain-spoken the Plannan should be shut out would be very imperfect; yet as a should be shut out would be very imperfect; yet as a smooth of the plannan is a work of the greatest imperiod of the plannan is worth copying nearly in tall:—

portance, and of much power and beauty. It cannot be ignored by any one who wishes to be acquainted with the earliest English literature. Still there are other books which might be made the subject of examination, and there can be no doubt that the selection of this work is a grievance to Catholics. The same has lately been done, we understand, at the University of Edinburgh, for an examination in which ladies are to compete. Those who make these selections need not be actuated by any sectarian bias. The hardship however is the same.

Now all this reveals a strange state of mind, a state of mind the opposite to that of robust controversialists or of controversialists who have a real conviction that their cause is the cause of truth, and that it therefore must in the end triumph over all enemies. have always felt the deepest respect for the ecclesiastical historian—we think it was Baronius himself—who argued that the Papacy must be of divine institution, because no merely human institution could have outlived the shame brought on it by the wickedness of Pope John have outlived the shame brought on it by the wickedness of Pope John the Twelfth. That was the argument of an honest man who was not afraid to look the facts in the face, and of an ingenious man who, when he had looked the facts in the face, knew how to turn them to his own purpose. The people who think that to set Piers Plowman in an examination is to lay an ambuscade for the faith of Oatholic youth deal with things in quite another way. They think that the facts are unpleasant, and so they want the facts to be burked. They pretend to see a grievance in the choice of Piers Plowman as a book for examination; but the real grievance is in the truths which Piers Plowman reveals. Let us make the somethe truths which Piars Plowman reveals. Let us make the some-what unreasonable concession that modern Roman Catholics have some right beyond other Englishmen in the English Church of the fourteenth century. What does Piers Plowman then prove against them? Simply that the English Church, and the English nation, them? Simply that the English Church, and the English nation, and English society generally, were very far from being perfect in the fourteenth century. Is it any article of faith of the Roman Catholic religion to believe that they were perfect? If it is, it must be one of the last invented set of dogmas, for most certainly no necessity of the kind was laid upon men in the fourteenth century itself. If the Church was at all times perfect, if it had no vice, no corruption, in its Head or in its members, what, we would ask, was the use of so many reformers of various kinds—reforming Popes, reforming Councils, and the Council of Tront as the crown of them? Perhaps the shine may have been a little taken out of the Tridentine Assembly of three hundred years past by the Roman assemblies of our own day, but hundred years past by the Roman assemblies of our own day, but that Council, which settled, for a season at least, the standard of orthodoxy for the unchangeable Church, was a reforming Council quite as much, though not quite in the same way, as any gathering of Anglicans, Luthernus, or Huguenots. The calling together of the Tridentine Council, the calling together of any Council which is to do practical work and not merely to sit and invent dogmas, is of itself a confession that the Church is not perfect, that there are things in its members, sometimes even in its Head, which are not as they ought to be, and which the Council seeks to make better. It is absurd to call the Vision of Piers Plowman "a satire against the religion of Roman Catholies." Langland did not write a satire religion of Roman Catholics." Langland did not write a satire on the religion of Roman Catholics or of anybody else; he did not write a satire on the religion which he himself and everybody about him professed. But, like a crowd of good men before him and after him, including many whom the correspondent and the Editor of the Month are bound to look upon as saints, he used very strong language about the corruptions of that religion. We suppose that every English Roman Catholic makes it part of his duty to reverence St. Thomas of Canterbury; but St. Thomas of Canterbury has left behind him sayings about the Papal Court and its doings which would sound much more natural in the mouth of Mr. Whalley than in the mouth of Archbishop Manning. So has every English writer, from the Poterborough Chronicler onwards, who thought and spoke like an Englishman. How very unpleasant it and spoke like an Englishman. How very unpleasant it must be to the correspondent of the Month if he ever turns a page of Matthew Paris! what a bugbear in his eyes must be that Holy Robert of Lincoln, whom we can afford to reverence, he who was "Domini Pape redargntor manifestus, Romanorum mallous et contemptor." The greed of Rome, a Romanorum mallous et contemptor." The greed of Rome, a phrase which we hear that some votaries of the new faith are too delicate to put up with, is the one endless theme of English indignation, in the mouths of men who did not depart one jot or one tittle from the theological orthodoxy of their time. What is instead of the Vision of Piers Plowman, Roman Catholics had been called upon to examine in that medieval, and probably quite orthodox, writer who suggested that the very title of the Bishop of Rome expressed his nature, that he was called "Papa" because he

was endlessly saying "pay, pay?"

One point, of course, is to be borne in mind. There is a difference between the position of the mediaval writers and of anybody now, whether Roman Catholic or Protestant. When the author of the "Vision," or Matthew Paris, or St. Thomas of Canterauthor of the "Vision," or Matthew Paris, or St. Thomas of Canterbury, or anybody else in those days, speke against the corruptions of his own time, he was, in the strictest sense, washing his dirty linen at home. He was speaking to men of the same belief as himself, and there were no people of any other belief within hearing. The Saracens, the Greeks, the Albigenses, were too far off to listen. There was nobody at hand who stood openly out of the right path, bating a stray Jew here and there whom nobody thought of. Indeed in Langland's time, after Edward the First had cleared out the Jews, and before the Lollards had begun to account the land must have been an unmixed paradise of artificioux. In such a state of things as this people are not appearance as the what they say; but on the other hand, neither are

they so squeamish as they might be as to what they do. The whole thing is domestic; there are no strangers looking on. A little opposition is useful to a Church as well as to a Ministry. A Church which has it all its own way is sure to get corrupt; but then those among its members who are thenselves untouched by its corruptions will not scruple to use the very strongest language about those corruptions. In so doing they are simply warning their brethren, they are not exposing the common weakness to an enemy. It is impossible that any religious body in England now should be in the same corrupt state in which the English Church was in the fourteenth century. It is impossible, if only because there are other religious bodies in the land, with their eyes open to anything that is amiss in their rivals. And for the same reason, so far as there are corruptions in any religious body, the righteous and reforming members of that body will not use the same plainness of speech as men did of old, simply for fear lest the enemy should hear them. There is of course the further fact that it is not the fashion of the There is of course the further fact that it is not the fashion of the nineteenth century to use the same plainness of speech about any matter that was usual in the fourteenth. But, making all allowance for this, we may be pretty sure that Langland would not have spoken quite as he did, if there had been a colony of Dis-

senters within hearing.

In this way we can understand that Piers Plowman and many In this way we can understand that Piers Plowman and many other medieval writings may not be very pleasant reading to modern Roman Catholics. There is a sense in which they are not pleasant reading for any English Churchman, or for a patriotic Englishman of what religion soever. To read of the corruptions of the Church under Edward the Third is unpleasant reading, in the same way in which it is unpleasant reading to read of the corruptions of the Court or the State generally under Charles the Second or Charles the Second Section of the Court of the State generally under Charles the Second or George the Second. But to say that it is a Charles the Second or George the Second. But to say that it is a grievance for Roman Catholics to be set to read about the one is as abourd as to say that it is a grievance for Englishmen to be set to read about the other. The truth of history is very often unpleasant, but it does not follow that the truth of history is to be burked. The whole thing is a question of truth and falsehood. It is part of the truth of history that for several ages the English Church was very corrupt, and that the chief source of corruption was the shameless greediness of the Popes. It is part of the truth of history that there always were Englishmen who protested against these things. It is, according to the correspondent of the Month, a grievance for one class of Englishmen to be set to study one of the books which most strongly set forth these truths. We one of the books which most strongly set forth these truths. We deny that English Roman Catholics have any interest in the matter beyond other Englishmen. And we feel sure that there are many Roman Catholics who, like Baronius, are ready to look the truth in the face. But if there is any class of people by whom the truth of history is felt as a grievance, the fault and the misfortune are wholly their own. History cannot alter itself to please them.

THE SERVANT GIRL OF THE FUTURE.

A ROMANTIC writer in the Cornhill Magazine, who has perhaps not forgotten the success of Mrs. Stowe's famous story, has just drawn a tragic picture of the white slavery of English households. We are asked to believe that the middle-class kitchen is ruled in the spirit of Legree, and that the miserable and degrading servitude of the inmates only just stops short of the lash. "No lady," we are told, "feels herself degraded by the use of harsh language to her servants, just as no slaveholding lady feels herself degraded if she strikes her slave or orders her out to be flowed." It is "only in quite exceptional houses that servants ROMANTIC writer in the Cornhill Magazine, who has perherself degrated it she strikes her slave or orders her out to be flogged." It is "only in quite exceptional houses that servants are held to have any rights beyond the elemental ones of food, lodging, and wages." The wretched maid-servant lives underground, surrounded with "damp, drains, want of efficient ventilation, with the constant presence of draughts" in winter, "and in summer these are supplemented by a furious fire for many hours in the day." If she is not doomed to sleep in this subtorgrapment dungeon her had is high up near the world "the subterranean dungeon, her bed is high up near the roofbleakest room in winter and hottest in summer." Her food is inferior to that of the family, and she is denied the opportunity of taking a regular "constitutional." If anybody desires to realize the inhumanity with which servant-maids are treated in this country, he has only to read "the list of what is denied in an ordinary well-conducted house." This list is really so harrowing that we prefer to give it in the writer's own words:-

No followers, no friends in the kitchen, no laughing to be heard above stairs, no remping for young girls to whom remping is an instinct all the same as with lambs and kittens, no cessation of work save at meal-times, no getting out for half-an-hour into the bright sunshine save on the aly, or after the not very pleasant process of asking leave; and, above all, no education for the fancy or the intellect beyond a dull magazine for Sunday reading.

. . When they have done their work, is it not pleasure enough for these young women in the prime of life, and with the first flush of that desire for experience inherent in human nature knocking at their hearts, to ett down alone, or two together, in the allent kitchen with a basketful of sawing for their evening's amusement?

Add to "grinding work and claustral monotony" the "demoralizing impossibility of drawing any great prizes in the sordid lottery of brooms and saucepans," and you have English domestic service in all its monstrosity. "The comployer is absolute; the servant is only his movable ser from whom its demands all he desires, stinting nothing of his own mentals while giving back only the stipulated convention." Is may be inferred from

this catalogue of enormities that a servant-maid ought to be lodged in the best bedroom; that she should be encouraged to gratify her lamblife or litterlike instincts by romping up and down stairs, and to take a frequent airing for the good of her health; that the invidious ceremony of saking for leave should be dispensed with; that followers should be welcomed whenever they choose to drop in; and that the toils of cleaning and cooking should be relieved by appropriate "education for the fancy and the intellect." Betty should have an opportunity to "learn French or German, to play the piano, to try her skill in paint and crayons." The writer does not think that "a box of crayons on the kitchen-table in the evening would spoil the pastry in the morning," or that "a piano below stairs would sound more inharmoniously than a piano below stairs would sound more inharmoniously than a piano above stairs"; and holds that it is monstrous that "a literary or artistic maid, if she wants to keep her place, should have to understand that the golden resp her place, should have to understand that the golden apples of the tree of knowledge never grew for her plucking."

We are reminded that Margaret Clement, Sir Thomas More's domestic, corresponded with Erasmus, and was complimented by him on her "chaste letters"; and the writer's ideal of a good plain cook apparently includes a similar range of culture.

The writer of this article, which is entitled "On the Side of the Maids," apparently forgets that there is also something to be maids," apparently torgets that there is also something to be said for the mistresses who are therein calumniated. The picture of domestic service which is presented is not only morbidly sensational, but ludicrously false. It is certainly not true that "no lady feels herself degraded by the use of harsh language to her servants," that servants are stinted of their food and abstractly in an approximate and temporal manner on that it is servants," that servants are stinted of their food and naditually treated in an oppressive and tyrannical manner, or that it is "impossible for any but the upper servants of high-class houses to make a solid provision for the future." And the reason why it is not true is tolerably obvious. It is simply that, if mistresses attempted to treat servants in this way, servants would not submit to it, and that in the competition of households, and the great variety of occupations now open to women, servants have so largely the advantage of the market that they are able to command their own terms. So far from the employer being absolute and the cook or housemaid being only a movable serf, the employer of domestic labour at the present moment cannot halp being reinfully impressed with the detailed the court and the employer of domestic labour at the present moment cannot help being painfully impressed with the fact that the case stands decidedly the other way. Domestic servants, considering the nature of their work and what is provided for them in the house, are highly paid, and the scale of wages is continually rising. It is probably true that they too often neglect to make a solid provision for the future, but they have unquestionably better opportunities of doing so than almost any other persons of their rank in life, and many of them do make good use of these opportunities. In fact, a tidy, well-behaved servant, who is known to have lived in good houses, is very much run after by ambitious suitors of her own class for the sake of the dot which she is supposed to have accumulated, and it is the wifes savings she is supposed to have accumulated, and it is the wife's savings that furnish the house or set up the shop. There are of course all sorts of mistresees just as there are all sorts of servants, and cervants are not invariably well treated; but, as a rule, the self-respect of the mistress and the independence of the maid combine to secure for the latter considerate and kindly usage. The truth is that the peace and comfort of an ordinary middle-class household are so much in the hands of the servants that it is necessary to conciliate them by all reasonable and even by many un-reasonable concessions. Indeed there could hardly be a more striking proof of the false key in which the Cornhill article is pitched than the assumption which underlies it that women servants are at the mercy of their mistresses. The writer remarks that in this age of strikes it is strange that there should not be a strike in the kitchen as well as in the workshop; but the explanation is simply that servents are perfectly able to extrange explanation is simply that servants are perfectly able to get what they want without striking, and that it is in the parlour rather than the kitchen that a strike should be looked for. It cannot be denied that the kitchen is usually at the bottom and the servants' bedroom at the top of the house. All that can be said is that the basement seems a convenient place for a kitchen; that, as somebody must sleep at the top of the house, it is more natural that it should be the servants than the mistress; and that the securants of the upper section have at any set the educate the first occupants of the upper region have at any rate the advantage of fresh air. It is also true that servants do not always partake of exactly air. It is also true that servants do not always partake of exactly the same dishes as their master and mistress, and in some cases they would probably think themselves hardly used if they were expected to be content with what is thought good enough for their employers. There are few servants who will look at Australian meat, for example, and it is therefore reserved as an exclusive luxury for the family. Although the servants' table is not furnished with the delicacies of the season, their fare is usually more abundant, and not less nutritious, than that served upstairs. The writer of the article in the Combill lays great stress on the continuous and incessant nature of domestic attendance. A servant's work, it is said, is never done potentially, if ever actually; she is liable to be rung up at all hours; her very meals are not secure from interruption, and even her sleep is not sucred. All this sounds very dreadful, but it really only comes to this, that a servant who is engaged to answer the bell is expected to come when it rings. It may be very hard that her sleep should be disturbed merely because some one has been taken ill in the night, but then this happens to be one of the duties for which she is retained, and it is not every night that she is thus summoned from her meat. Swift, in his Directions to Servents, remarks that, if servents

are weak enough to answer a bell before it has rung two or three times, there will be no end to their drudgery; but he did not carry his drollery so far as to suggest that a servant should not be required to answer at all if she happened to be busy with her crayons or her piano. In a well-regulated house, though a servant's liability to be called on to do something or other may be extended over a dong day, her actual work is by no means continuous, nor does it make any serious demand on her physical strength. At least a couple of servants are indispensable in any family where the mistress does not take upon herself a considerable amount of household work; and the staff even of many moderate middle-class houses includes cook, housemaid, parlour-maid, and one or two nurses, each with definite and separate duties. And this division of labour is continually being carried further. this division of labour is continually being carried further.

The sort of plea for opportunities of acquiring artistic accom-plishments and cultivating the mind which is here put forward for pasaments and cultivating the mind which is here put forward for maid-servants might, with equal propriety, be urred on behalf of persons employed in any other of the common kinds of labour. Indeed we observe that the writer goes so far as to hint that "the higher nature" of the butler also requires to be developed by facilities for culture and refinement. There are a vast number of people in the world who have to work hard all the year in order to earn a livelihood, and who have certainly little leisure for improving their minds, and yet their condition is not thought for improving their minds, and yet their condition is not thought to be so very deplorable. Nothing, it seems to us, can be more mischievous and unwholesome than the sickly sentimentality which tries to squeeze a tear over the fate of a stout, able-bodied young woman who has four, or perhaps five, hearty meals a day, a comfortable home to live in everything provided for her, good wages, and no more work to do than, if taken continuously, could be got through in three or four hours. We do not mean to say that no servants are overworked or underpaid, but this is certainly not the condition of the majority of them. As egards the ordinary comforts of life, domestic servants are infinitely better off, not only than their relatives at home, but than women of the same class in other occupations. They have, however, less personal liberty. A shopgirl or seamstress works much harder, personal liberty. A shopgirl or seamstress works much harder, but when her day's work is over she is free to spend her time as she chooses; she can go out with her young man without asking anybody's leave, and can wear a chignon and Tyrolese hat, and consult anybody a leave, and can wear a congron and tyroless hat, and consult her own taste as to the fashion and colour of her raiment. It is not at all surprising that many young women should find a great temptation in this direction, and should chafe at the confinement and discipline of household work. Every occupation lms its advantages and disadvantages, and they must be taken together. The balance of solid comfort, peace of mind, and good wages is decidedly on the side of the maid-servant, and this must be her companyation for the restmints of service. It is a voluntary compensation for the restraints of service. It is a voluntary choice on her part which of the two she will have. It is very easy to talk of grim seclusion and claustral monotony, and to say that there is no reason "why Betty may not have her friends and lovers to come to see her, poor wench! all the same as they come to see the young ladies upstairs," or " why the feelings of the family the young ladies upstairs," or "why the feelings of the family should be outraged, and propriety along with them, if her merry laugh penetrated even to the sacred enclosure of the dining-room and parlour," and that Betty should also be shlowed to indulge her natural instinct for romping, and her thirst for "experience" after tea. But anybody who tried to conduct a house on these principles would be likely to be landed in some very awkward consequences. Where there was only one servant it might perhaps be possible to have a specially licensed follower under certain conditions; but what is to be done where there are several servants? If Betty the housemaid may entertain her friends and awest-If Betty the housemaid may entertain her friends and sweethearts, the same privilege cannot be denied to Susan the cook and Jane the nursemaid, who are also entitled to share in the romping, to take their turn at the piane, and to join in the adventures in search of experience in the evening. Something has no doubt been done of late years to relax the discipline of service, and the custom of granting regular holidays is gradually making way. Servants can stipulate for privileges of this kind, as well as for wages; but it is quite impossible that a domestic who is hired for continuous service, and is a regular member of the household, can ever be placed in just the same position as a person who only attends at a shop or warehouse for a fixed number of hours to perform a stipulated piece of work, and then goes off where she pleases till next morning. There can be no doubt that the existing relations between domestic servants and their employers are by no means satisfactory, though nothing can be more absurd and contrary to notorious facts than to describe the attitude of the former as "the submissive service of slaves." It is certainly desirable that mistresses and maids should arrive at a better understanding as to the footing on which they stand towards each other; but little good is to be expected from maudlin mosnings over the imaginary miseries of a class which just at present is extremely well able to take care of its own interests, and by no means indisposed to use its power in that respect, or from spiteful attacks on the matrons of England as selfish and cruel slave-drivers. The truth would seem to be that, while there are probably faults on both sides, the cause of the present difficulty is mainly to be found in the fact that service is in a transition state between the recognized dependence of the servant on the master, and the repudiation by the former of all ties except those of pay and contract.

AN ECCLESIASTICAL POLICE-COURT.

AN ECCLESIASTICAL POLICE-COURT.

THERE are, no doubt, some advantages connected with the simple and summary process of the polico-courts in dealing with small offences; but it may perhaps be questioned whether it is altogether adapted to the purposes of ecclesiastical discipline. Those, however, who think it more important that justice should be swift than sure will probably be delighted with the project of a new court that is to despatch clergymen accused of irregular ritual or heretical doctrine with the same case and promptitude with which the magistrates dispose of petty thioves and drunken navvies. This remarkable scheme has just been started by, or at least in, the Times. That the Times, with its present weakness for all sorts of philosophical-Radical fads and priggish crotchets—one day denouncing the Inns of Court, another day threatening the publicans with a whisky war, now coquetting with Trade Unionists, and next flirting with Positivists—should take it up is not perhaps surprising; but it would be interesting to know a little more of the origin of the design. Whether the thing be right or wrong in itself, it is surely improper that it should be tossed upon the world, not as a carefully considered scheme emanating from an authoritative source, but as a mere jaunty omanating from an authoritative source, but as a mere jaunty leading-article description of a scheme, conceived in mystery, and put forth on nobody's responsibility. Somebody would seem to be much to blame for his folly or his cunning in sending up a pilot balloon of this kind, instead of leaving the matter to be sublicly presented in some suthers is degenerate and with a to be publicly presented in some authentic document and with a signature of weight. Whether or not the idea of the new court signature of weight. Whether or not the idea of the new court is the invention of the *Times*, the arguments by which it is supported are perhaps its own. Starting with the assumption that the Purchas Judgment is one of "the clearest decisions of the that the Purchas Judgment is one of "the clearest decisions of the courts of law," the writer displays his ignorance of the bearings of that decision by remarking that the "extreme High Church party" have refused to obey the "law about the priest's position before the altar." The fact is that the Purchas Judgment on that point hit, not the "extreme High Church party," but the whole party, and welded them into one with the sense of a common grievance; and it is this which has reduced the bishops to their present dilemma. Mr. Purchas did only what has always been believed, and is still believed by many lawyers of higher legal authority than at least half of the tribunal which decided against him, to be undoubted law, and to be affirmed in so many words by previous decisions of the Judicial Committee itself. Mr. Purchas, who in the first instance was condemned unheard, because he was not in a the first instance was condemned unheard, because he was not in a position to employ counsel to defend him, was afterwards refused a hearing when he had been provided with funds for the purpose; and there the matter stands. It is quite possible to think that this is not a satisfactory state of the law without sympathizing with Mr. Purchas's personal line of conduct.

As the *Times* endeavours to fasten exclusively on the extreme

High Church party the enormity of rejecting an equivocal judgment based on exparts argument, it must be supposed that it is ignorant of the notorious fact that the Bishop of London, who sat as a member of the Judicial Committee on that occasion, has given up insisting upon compliance with this point in his distribution of patronage. This makes it the easier to understand that "the example of such disobedience is contagious." It is absurd to talk of the highest Court of Appeal being "treated with a contunuely which no other class of Englishmen ever show to the humblest court of justice in the kingdom." A decision which has practically been abandoned by a high authority in the Church who had himself assisted in framing it can hardly be said to have the property and the reversel originals to the working of

who had husself assisted in framing it can hardly be said to have much title to respect; and the general opinion as to the working of the Judicial Committee was strongly expressed by men of both parties in the Judicature debates of hat Session with special reference to this very point of the Purchas Judgment.

It is instructive to observe what are pointed out as the chief defects of the present state of the law. We are told that the main source of all the mischief is not the uncertainty of the law, but the difficulty of putting the law in force. "When a suit has been carried through the Court of Arches to the Privy Council, and a doubtful point has been decided, the decision has no direct and a doubtful point has been decided, the decision has no direct offect on any one but the clergyman immediately before the Court. If another clergyman chooses to declare that he does not deem the decision binding on his conscience, and that he intends to maintain the condemned practice, a similar process must be gone through. This observation is apparently directed at the Purchas case, and the writer's meaning would seem to be that it is extremely improper and unfair that, when once, no matter by what means or under what circumstances, a decision has been obtained which is satisfactory to one party in the Church, any other party should venture to question the soundness of the decision and challenge a venture to question the soundness of the decision and challenge a rehearing of the question. Those who think that the Purchas Judgment is one of the clearest and most authoritative judgments ever given by a court of law, and who attach no importance to the fact that legal opinion is divided on the subject—some of the most eminent and experienced lawyers who have examined it being of opinion that the decision is bad law—are naturally anxious that it should be at once established as fixed and irrevocable, and that the only question should be how to punish those who dissent from it. It is obvious, however, that this would be to apply to doubtful questions of ecclesiastical law a very different mode of treatment from that which is applied to other legal questions. If there is a question of right of way, for example, all those who hold that a particular path is improperly closed to them are at liberty to put their alleged rights to

the test in turn if they choose—of course at their own peril. If they are found guilty of trespessing, they must take the consequences; but there is nothing in the fact that A. has been defeated in an action of this kind to prevent B. from raising the same question by a repetition of the same set; and even if B. is beaten, C., D., and all the rest of the neighbours remain equally entitled to reopen the matter if they think they have still a chance of obtaining a decision in their favour. As a rule, no doubt, a decision in one case is accepted as settling other cases; but that is only if the other persons concerned voluntarily chouse to submit to it, either because they have no hope of reversing the decision, or because they do not think the point sufficiently important for renewed litigation. If they pleased they could defy the decision, and the other side would then have no alternative but to attack them in detail or leave them alone. No question is ever decisively and finally set at rest by a judicial decialternative but to attack them in detail or leave them alone. No question is ever decisively and finally set at rest by a judicial decision in such a way that the discussion can never under any circumstance be reopened; and everybody knows that all sorts of questions are constantly turning up over and over again in the courts, with varying results. The present position of clergymen of the Church of England is simply this. They are entitled to interpret the law of the Church in their own way at the risk of being prosecuted by those who differ from them. If they are prosecuted, they have a right to vindicate their position and to show that the law, rightly understood, is on their side. The object of those who are now clamouring for a "simple, summary, and inexpensive" process for securing obedience to the law would appear to be to deprive clergymen of this privilege. They are not unreasonably afraid that, if such a question as that involved in the Purchas case were to be reopened, they would loss the advantage of a snatched victory, and they are auxious that all further discussion should be peremptorily closed. We have of course no intention of discussing the particular merits of this case. We have referred to it merely because the Times has done so, and our only object is to illustrate the exceptional and unfair way in which it is proposed to shut the mouths of clergymen who wish to only object is to illustrate the exceptional and untair way in which it is proposed to shut the mouths of clergymen who wish to show that their reading of the law is right before they are punished on the assumption that it is wrong. The spirit of the article on which we have been commenting is significantly indicated in the remark that on secondary points of ritual "a clergyman has only to act on his strict legal rights, and the parishioners must either let him are his own way or a require in a succession of arterway. either let him go his own way or engage in a succession of extrava-gant law-suite." A law-suit to prevent a man from exercising his legal rights may be fairly described as extravagant and something more; and the propriety of providing a summary means of punishing clergymen who have the presumption to stand up for what are admitted to be their rights will, we hope, be appreciated by those who value a just and impartial administration of the law more highly than a party triumph.

It is of course impossible to judge of the projected Diocesan Council from the account of it which is given in the Times. It is proposed that the Board should be composed in equal proportions of clergy and laymen, the latter being elected by the churchwardens of each diocese, and that the monition of the Ordinary, issued on the notice of the Board, should have summary effect, and be capable of being enforced by the sequestration of the benefice, subject only to an appeal to the Archbishop of the Province. A court of this kind would no doubt be preferable to episcopal autogracy, but there is perhaps some danger that the process of autocracy, but there is perhaps some danger that the process of election would set each diocese in a flame. Each of the candidates would naturally be expected to give some pledge in regard to whatever might be "the notorious Ritualistic" church in his part. of the world; and American experience of elected judges is by no means encouraging. The Times itself cannot disguise that "the great difficulty will be to define the limits of the proposed discretion, and to prevent its operation being rendered vexatious," and suggests that "bishops should give some security for their intentions by specific clauses in the Bill." In considering this question, Lord Salisbury's wise remark at the Leeds Church Congress, that there is no medium between the policy of Alva and the policy of Gameliel may be prefitably remembered. It has Congress, that there is no meaning networn the policy of Gamaliel, may be profitably remembered. It has been proposed that any member of a parish should have a right to call upon the bishop to enforce what is supposed to be the law, and the highest would then have no alternative but to do so. This call upon the bishop to enforce what is supposed to be the law, and the hishop would then have no alternative but to do so. This would be one way of getting rid of the bishop, but it would threw a dangerous temptation in the way of meddlesome or malicious parishioners. On the other hand, it would be equally perilous to place clargymen at the mercy of bishops to be dealt with offined, and the injustice of legislating against incumbents without some analogous tribunal over bishops is also obvious. We should imagine, however, that it would be idle to think of bringing furward a measure of the kind suggested during the present Session, with Parliament, Ministry, Convocation, and everything new. For good or bad, it would amount to a revolution in the Church, and ought not to be taken up in a light or hasty temper.

CHAUCER'S PILGRIMAGE TO CANTERBURY.

A BOUT half a mile beyond Dartford, at the top of the hill from which the churchyard looks down upon the church tapple, is the remnant of a heath called Dartford Brent. From this point, marked by a windmill, the old road noticed, in arthury maps as "Roman Road," and in the Ordmanos Map, No. 3, and Watling

Street," runs to the south of the m medern road, along the open high Street," rans to the south of the medera road, along the open high land shows the Themes, and then smong the woods, having on the left Stone Castle, where a castle stood at the time of the pilgrimmes. Nearly three miles from the Brent is the first cottage in the hamiles of Stonewood. The cottage garden divides the road into two hamiles. That on the left is Watling Street, and can be inflowed, on foot only, for a mile and a half, or less, through Swansoumbe Park Wood, and then over two or three fields night to the road which over two or three fields night to the road which continues wight on assistant to Elicated, on foot only, for a mile and a half, or less, through Elwanscombe Park Wood, and then over two or three fields nigh to Elyminghead, into the road which continues right on castward to Mochester. The right-hand road, running through Stonewood and a deep, wild, sandy lane, is a way for carriages to the point at which the path coming from Swanscombe Park Wood falls into the road. In the fields between the wood and the road the words "Ascient Remains" are printed on the Ordnance Map, No. 1. Roman coins and other relies have been turned up here by the plough, and it is said that there is still a large undisturbed treasure of such things. Southfleet is about a mile and a quarter to the south of these ancient remains. The Ordnance Map, No. 6, and the map "Britannia Romana" place close to this little town of Southfleet Vagniaces, a station in the second Iter of Antoninus, the nearest to Rochester on the way from London. Antiquaries do not agree as to the proper site of Vagniaces; one or another of them gives it to Wrotham, to Swanscombe, to Springhead, to Maidstone, or to Northfleet, and the map "Britannia Romana" marks it as standing on Watling Street. If Vagniaces and Southfleet were the same, or close together, and stood on Watling Street, then another way must be found from the cottage in Stonewood to Southfleet, and from Southfleet to Wingfield Bank, about half a mile east of Springhead. But it will be safe to believe in the road through Swanscombe Park Wood. Northfleet and Southfleet were the extremes of the fleet or creek which once ran inland from the Thames. It is probable that Vagniace was the military station at Southfleet, the head of the inlet, that the remains show another station which was on Watling Street, between Northfleet and Southfleet, and that a road from Vagniace joined the great road at Wingfield Bank. In Hasted's time the Roman road was, and to those who seek perhaps is now, very visible in its course from Springhead in a direct line towards Cobham Park and Rochester. to those who seek perhaps is now, very visible in its course from Springhead in a direct line towards Cobham Park and Rochester. From the ancient remains, passing Springhead and Wingfield Bank, it runs more than two miles to Northumberland (late. About midway, "Watling Street" is again marked on the Ordnance Map, No. 6, for the length of a mile. At the end of the two miles and more, it crosses the high road from Gravesend to Meophan, close to the Northumberland turnpike gate, and proceeds through the header of Singlewell on to Cubben, Park, sometimes up the close to the Northumberland turnpike gate, and proceeds through the hamlet of Singlewell on to Cobham Park, sometimes on the right, sometimes on the left of the present road, and at other times falling into the road itself. At the distance of rather more than two miles from the turnpike is St. Thomas's Well. Ten years ago, an old pump with a raised wooden platform stood over the well on a waste grass plot by the road side, and it still remains, but the greater part of the green margin is now enclosed in the roaden of a rabuilt cottage and the nump, impured but ween the but the greater part of the green margin is now enclosed in the garden of a rebuilt cottage, and the pump, jummed between the garden fence and the highway, looks fitter to supply a suburban alley than to mark the spring from which Chaucer drauk. For about half a mile from the well to Brewer's Gate, the northern lodge of Lord Darnley's park, we have an English country road in perfection, winding through the open woodland with snatches of greensward and fern. Here the present way does not seem exactly to follow the course of Watling Street, nor further on, for three miles more, from Brewer's Gate to Strood Hill, as it passes three miles more, from Brewer's Gate to Strood Hill, as it passes between orchards and hop-gardens on the one side, and on the other the park which, a few years after Chaucer's death, Joan of Chabers have the control of the control other the park which, a few years after Chaucer's death, Joan of Coblam brought to her third or fourth husband, Sir John Oldcastle. Hasted says that the Park pales seemed for some little space to stand on Watling Street until it came to Brewer's Gate, where it ran into a thick wood, and was not to be followed. At Strond Hill the modern coach road, coming from the north-west over Gadshill, receives the old road at the distance of a mile from Rochester. From Strood Eustace Deschamps, a friend whose society greatly influenced Chaucer; took the legend upon the England more than he loved Chaucer, took the legend upon the mith of which he once and again represented Englishmen as animals who had not yet shed their tails

who had not yet shed their tails.

Crossing Milton's smooth Medway, Spenser's bride of the Thames, the pilgrims went through Rochester, the Durobrivis of the second, third, and fourth itiners of Antoninus. Between the quarrel of the Friar and the Summoner near Bexley Heath, and the arrival at Rochester, the Wife of Bath, the Friar, the Summoner, the Clerk, the Merchant, the Squire, the Franklin, the Doctor, the Pardoner, the Shipman, and the Prioress, had told their tales, to which were added Chancer's Rime of Sir Thopas and his tale of Melibeus. At Rochester the Host called upon the

Monk :-

My lord the Monk, quod he, be many of chere, For ye shal talle a tale trewely. Lo Rouchester stendeth here inste by. Ride forth, min owen lord, breke not our game.

And the worthy Monk went on repeating, from a hundred tragedies that he had treasured in his cell, until his companions told him that his talking was not worth a furtherly, and called mon him for something gladsome, somewhat of hunting. On the high road at the top of Chatham Hill, adjoining Rochester, remains of Watling Street were to be seen in Hanted's time. These to Rainham, three miles, the hadge on the north side of the modern way stood upon the Roman road. Prom Rainham almost the Roman road. Prom Rainham almost the Roman road.

south side, and just short of Newington the two became one. In the Ordinance Map, No. 6, "Watling Street" is marked for the distance of about a mile from Newlagton to Kayvell Hill, where, according to Hasted, a great quantity of Roman urns and other relics have been found. Hard by are the remains of Roman entrenchments. Some antiquaries have been is elined to place the Roman station Duradeoms at or near Newington. Sittingbourne, named by the Stanmoner, is two miles beyond Kayvell Hill. Three miles further on is the handet of Green Street, and beyond for a mile, from the forty-fourth milestone, "Watling Street" is again marked on the Ordinancs Map, No. 3, and Duradeoms is placed close to Green Street, at the distance of a mile and a half west of Judd's Hill, and two miles west of Oppringe. The map "Britannia Romana" sets Duradeoms on Judd's Hill, and writes "Watling Street" over against it. Roman coins and urns in abandance have been found here, with ruins of Roman fortifications. If two inconsistent things could be allowed, there is authority enough to support both maps, and to give the old camp habitation both at Green Street and at Judd's Hill. Most of the copies of Antoninus make Duraleoms, which, on the second Itor, is the station next to Rochester, to be either thirteen miles distant from that tows, which would place it at Green Street, or sixteen, which would set it upon Judd's Hill. However, the Pentingerian Tables, says Hasted—and Mr. Somers seems to agree with them—make it to be only seven miles from Rochester, that is at Keycoll Hill. But in the third Itor, in some copies it is twelve, in others sixteen miles from Canterbury; twelve would give Green Street, sixteen Keycoll Hill, or a Green Street, or at Judd's Hill; and yet, quoth he, as though he feared that he had not been doubtful enough, Canden, Lambarde, Gale, and other loanned antiqueries, place it, where no Roman remains have been found, at Jenham, seven miles south of Sittingbourne; while Mr. Talbot and Dr. Stukely, after much hesitation, decl

When the sunne arose in the east full clere, Fully in purpose to come to dinere, Unto Ospring and brank there our fast.

Soon after leaving Ospringe, which is about nine miles from our journey's end, Watling Street and the modern coach road separate to join again at Harbledown, the boundary of the berough of Canterbury. Between Ospringe and Harbledown there is sure proof that the old Roman road and the road of the pilgrins were one. There is no vestage of a Roman way upon or near the modern road which passes through New Boughton—not Chaucer's ancient village of Boughton, clustering round the church, but the offspring of that new road along whose side it straggles. This coach road goes through the forest of Blean, and it is probable that there was a pathway there before the high road was made. At the top of one ridge of the Blean, between three and four miles from Canterbury, is an old public-house called "The Gate," perhaps marking an entrance into the forest. The main entrance was on Watling Street, about a mile to the south, where the old word hatch—a gate or door—is preserved, as it is universally on shipboard, and frequently in the names of places on land; as at Hatcham, the old boundary between Kent and Surrey, the old Halfpenny Hatch in the Kent Road, and elsewhere. The pilgrims' road probably ran direct from Ospringe, or from a point a little to the south of Ospringe, into South Street, a hamlet in the parish of Boughton, hear Boughton Church, which is about a mile to the south of New Boughton. Hasted says that, according to report, the old Homan road through South Street was once the only road in the parish of Boughton, and that in the year 1710 a coin of the Emperor Antoninus was dug up in a hedge on the wayside. There does not seem to be any trace of an ancient road direct from Ospringe to South Street. At the distance of little more than two miles east from that town, a road turning to the right leads into South Street. Since the pilgrims passed Rochester, the Monk, the Nun's Priest, and the Second Ann had told their tales before they came to Boughton. At Boughton under Blean, the thorp, the old village, the travellers

Whan that tolds was the lif of scinte Cecile, Er we had ridden fully five mile, At Boughton under Blee us gan stake A man that clothed was in clothes blake,

The Yeoman had seen them ride out of their hostelrie in the morning. The Master, wishing to be one of the company, followed, trotting and walking, and as he drew night to Canterbury, almost in despair of overtaking them, he had spurred on the last three trailes:—

16056. — Sirea now in the morws tide, Out of your hostelrie I saw you ride. 16043. — he had ridden more than trot or pas. 16052. Fast have I priked (quod he) for your sake,
Because that I wolde you atake.
26027. His hakeney, which was all pomeles gris,
So swatte, that it wonder was to see,
It seemed as he had priked miles three.
The horse eke that his yeman rode upon,
So swatte, that unnethes might be gon.

Our journey cannot be delayed to listen to those masterpieces, the Our journey cannot be delayed to listen to those masterpieces, the Prologue and the tale of the Canon's Yeoman. Chaucer's avowed contempt, with the false science of alchemy, as elsewhere of astrology, provice how far in understanding he was beyond his age; while the characters of the projector, deceived and deceiving, and the servant deluded with his eyes open by the strong will and bigoted belief of his master, witness the piercing sight with which the poot read the inner man. His alchemists are not, like Ben Jonson's, mere cheats. We are now at Boughton, under the western side of an ancient royal forest, the Blean, which seems western side of an ancient royal forest, the Blean, which seems western side of an ancient royal forest, the Blean, which seems from the Ordnance Map, No. 5, to begin at the distance of about a mile north of the village of Chartham, to extend along a range of hills, its western boundary, five miles north almost to Sea Salter, and to be about four miles in breadth from New Boughton to Harbledown, the widest part. It was not in any parish or hundred, and having been from time to time, both before and after the Norman Conquest, disforested in parts, became the abode of vagabonds and outlaws. One part of it, as resembling a free port open to all wanderers, acquired the name of the Ville of Dunkirk. Boughton Church and the houses around it lie at the foot, and on the western side of the hill which bounds the Blean on the west. According side of the hill which bounds the Blean on the west. According to a new order of the tales, the pilgrims, being at Boughton and within six miles of their journey's end, travelled back twenty miles to Rochester, and then retraced their steps. In Tyrwhitt's edition, the Canon's Yeoman, who boasted that his master could pave all the ground to Canterbury with gold and silver, rehearses his prologue and tale between Boughton on the west, and Bob-up-and-down on the east side of the Blean:—

Wete ye not wher stondeth a litel toun, Which that yeleped is Bob-up-and-doun, Under the Blee in Canterbury way?

Since there is no little town of that name from Boughton to Canterbury, we must search by the description, seeking between thom for a place of sudden rises and falls. A traveller on the western side of the Blean, leaving Boughton behind him, turning his face towards Canterbury and crossing the hill, will find the place, immediately under the brow on the eastern side. We need not seek up and down for undulations. To bob up and down signifies jolting and dislocation, the motion of breakers, not waves. We want a little town standing upon broken ground, and we find it halfway between Boughton and Canterbury. The pilgrims were at Boughton immediately under the western side of the hill, across which was their direct way to Canterbury. Between South Street in Boughton and the top of the Blean are the remains of the old Roman road along which the country people still pass. The Yeoman began his prologue and tale, which occupy nearly a thousand verses, at Boughton under the Blean, and when he had finished, the travellers were still under the Blean, but on the other side. Below the brow of the hill on the eastern side, where the Canterbury, we must search by the description, seeking between side. Below the brow of the hill on the eastern side, where the hatch or gate into the forest formerly stood, within the compass of about half a mile there are some fifty ancient buildings, containing perhaps two hundred inhabitants, small farm-houses and clusters of cottages two or three together, upon ground consisting of such sudden rises and falls that, standing on one field, nothing more can be seen of the houses in the next field than the chimneys. This is Chartham Hatch, and—there can be no mistake—Chartham Hatch is Bob-up-and-down, under the Blee in Canterbury way, three miles from Boughton and three miles from Canterbury. The collection who will not struckly through the forest bury way, three miles from Boughton and three miles from Canterbury. Travellers who will not struggle through the forest may reach Chartham Hatch by going along the highway through New Boughton to the third milestone from Canterbury, and then by a cross-road to the south towards the village of Chartham, distant three miles, on the South-Eastern Railway, Bob-up-and-down being halfway between the high road and the village. Behind a little inn at Chartham Hatch, kept by Henry Baldock, and immediately under the eastern brow of the Blean, overgrown with briars, and running westward between steep banks into the wood, are the remains of the old road. between steep banks into the wood, are the remains of the old road, answering exactly to the road not far from Canterbury, which Erasmus describes in the Persymutio religionis ergo. This is part of the road which goes westward through the Blean to Boughton. Near Baldock's house is a outtage formerly occupied by William Near Baldock's house is a cottage formerly occupied by William Hubbard, a wood-reve, born in the year 1775, who lived to the age of more than eighty-four years, and now by his son. The old road passes by this cottage, and is still used, though not for carriages, by passengers to Canterbury, going through part of Chartham Wood, and then between Bigberry and Howfield Woods to Harbledown, where it falls into the main road. The inhabitants of Chartham Hatch know by tradition that the old main road, once the only road from London to Canterbury, went through their hamlet, having passed Boughton on the western side of the Blean, and continued through the woods towards the east, to Canterbury. Between Bob-up-and-down and the journey's end the prologues and the tales of the Manciple and of the Parson were told, and the Canterbury Tales ended. Chaterbury Tales ended.

Having so far followed the path of the pilgrims from the Tallard, we leave them at Harbledown within view of the Cathodral.

CHURCH LEGISLATION IN AUSTRIA.

OUR readers may have noticed a telegram announcing the close, on Monday last, of the general debate on the Ecclesiastical Bill introduced by the Government in the Lower House of the Austrian Reichstag, which was passed by the large majority of 222, votes against 71. Here Stremsyer, the Minister of Worship, described the proposed laws as the result of a calm and unprejudiced consideration of the existing state of affairs, and not an attempt to oppress the Catholic Church, observing that "the flovernment cannot permit the abuse of religion for the purpose of intrigues fraught with danger to the State, or allow the ministers of God to become the missionaries of an organized opposition to of God to become the missionaries of an organized opposition to the laws of their country. It is not intended to wage war against the Church, but to bring about order in her relations with the the Church, but to bring about order in her relations with the Government, that she may freely exercise her holy mission without encroaching on the inviolable rights of the State." And the Prince von Auersperg, President of the Ministry, added significantly, in reference to the threat of the Opposition that the Bills, if passed, would never be allowed to become a reality, that the Government would take care to enforce respect for the laws. This brief announcement contains not only the record of an unusually stormy debate, which opened on the 5th and closed on the 9th inst., in the Reichstag, but the result—practically, if not technically, we must presume the final result—of an agitation still in progress which has lasted for several weeks, and pervades all classes and political has lasted for several weeks, and pervades all classes and political parties in the country. The vote of Monday last is not absolutely final, for the separate clauses have still to be discussed, and the Bill will then have to pass the Upper House, where a strenuous opposition, organized by the bishops, is in course of preparation against it. But the end can hardly be doubtful after so decisive against it. But the end can hardly be doubtful after so decisive a verdict of the Lower House on the main issue, secured by the combined action of several parties, not always in harmony with each other or with the Government. Of the details of these new measures we spoke six weeks ago, and it may suffice to repeat here that, if in some respects they resemble the Falk laws in Prussia, they are far less sweeping and oppressive; there is indeed little or nothing which a foreign critic is entitled to find fault with, although some regulations read strangely to an English ever and must depend on local circumstrangely to an English eye, and must depend on local circum-stances for their justification. It must be remembered, however, that the Ultramontane faction is a serious difficulty both to that the Ultramontane faction is a serious difficulty both to Austrian and Prussian statesmen, but there is one important difference; in Prussia the Ultramontanes really have grounds of complaint, whereas in Austria their opponents might allege much better reason for dissatisfaction than themselves. Up to this moment, notwithstanding the friendly language of Herr Stremayer at the time of the Vatican Council, the Old Catholics have been unable to obtain any sort of civil recognition in Austria, and cannot even get married except through the unwelcome and reluctant ministry of the Established clergy, who of course throw all possible obstacles in their way. It is not surprising to hear that one section of the Liberals were disposed to yote against the Government measure unless it was exvote against the Government measure unless it was extended to include civil marriage and a recognition of the status of the Old Catholics, though they eventually abandoned a status of the Old Catholics, though they eventually abandoned a line of policy which would have practically played into the hands of the Ultramontanes. The extreme irritation of the latter is perhaps partly to be explained by the new legislation involving the final and complete abandonment of the Concordat, which, according to received Roman maxims, is binding on secular Governments until annulled by the Pope, though it is not binding on him any longer than he finds its observance expedient for the interests of the Church. Of the fact of their irritation at all events there can be no doubt, so will easily appear from what her taken place and be no doubt, as will easily appear from what has taken place and

The Prince-Bishop of Seckau, Dr. Zwerger, who seems to be a very mettlesome prelate, sounded the alarm a month ago in his Lenten Pastoral, though contining himself for the moment to general Lenten Pastoral, though contining himself for the moment to general forebodings of the deadly perils to which the Church and the faith were exposed, and pointed references to the bright example of the "martyr" Ledochowski, which would have to be followed soon by all Austrian bishops who were not prepared "to betray their faith." Meanwhile the Catholic Casino in Prague, under clerical guidance, busied itself in organizing mass petitions against the new laws, and the Ultramontane Vaterland denounced in no measured terms this attempt to impose, under a new form, "whatever Byzantinism, Gallicanism, Febronianism, Josephinism, and Cæsaro-Papism had devised against the independence and rights of the Church." The Government on its side was naturally anxious to establish entire union among the different sections. of the Church." The Government on its side was naturally anxious to establish entire union among the different sections of the constitutional party on this question, and a preliminary conference under the presidency of Prince Auersperg was held for the purpose. A proposal of Dr. Smolka to postpone, with the view of shelving, the debate in the Reichstag was rejected, and on this a petition from the Bohemian Catholic Union was presented to the Emperor, entreating him, in case of the Bills passing, to withhold the Royal sanction "until the consent of those divinely authorized to represent the Catholic Church had been obtained." The Vaterland explained at the same time that the abolition of the Concordat was incompatible with the principles of the Syllabus. As the day for the opening of the debate approached, the strife grew hotter, and a large number of members on both sides put down their names to speak. Cardinal Schwartzenberg, Archbishop of Prague, who had come to stay at Visania during the sittings of the Reichstag, was regarded as the standard beauty of

the Opposition rather than Cardinal Ranscher, who kept more in the healercound. On March 4, the day before the commencement of the delate, these superred a highly inflammatory pamphlet of Bishop Eweger's. He denies in the first place all right of the State to deal with acclesization in the first place all right of the State to deal with acclesization matters except by consultation with the Holy See, and then proceeds to argue that, if the proposed laws should be enacted, Catholics will be absolved from all obligation to obey them on the ground that such arbitrary usurpations are mere acts of violence, and we are only bound to obey the lawful authority of the State; when it transcends the rights allowed to it by God, it is disobedience to Him to submit. But the tendency of the proposed laws, as of those recently enacted in Prussia, is, he adds, to unchristianize the people, and the duty of resistance is all the more imperative in Austria, where Catholics cannot plead the excuse of being in a minority. "Here we are the majority." Such is the tone and drift of the Prince-Bishop's manifesto, which has been scattered in thousands of copies throughout the country, with the view of procuring as many petitions as possible to the with the view of procuring as many petitions as possible to the bishops from the various local Ultramontane Unions in order to strengthen their hands in the Upper House, or, if necessary, in a direct appeal to the Crown, which, however, is pretty certain to prove ineffectual. Addresses of the kind had already been received from Troppau, Salzburg, and some other places, before the debate began. That there was little hope of victory in the Lower House was probably well understood when it became known that the Left, the Centre, and the Party of Progress were united to a nan in support of the Government, and that some even of the Poles—whose help the Right had counted upon—were on the same side also. And the rejection of a second attempt to shelve the question by referring it to a Select Committee, proposed by the Moravian deputy Prazak, left no room for doubt.

Accordingly, when the discussion actually began, although the crowded state of the House and the galleries testified to the rest felt in it, a want of confidence was noticed in the speeches of the leading opponents of the Government. Count Hohenwart, who represented "the feudal Ultramontane view," spoke with calm and incisive force, but somewhat coldly; and Father Greuter, who is described as "the most pugmacious champion of the Curia in Parliament," was thought to have lost something of the fire and sarcastic bitterness of his earlier deliverances. He took care, however, certainly to be irritating, if not effective. The Tyrol, he pointedly assured his hearers, would never obey the new laws; an Evangelical was being substituted for the Apostolic Empire, and Austria was simply following the lead of Prussia, like a flock of sheep. The new laws were not merely an attack on the hierarchy, but on the Church, devised in the interests of Prussia. The speaker warmed with his subject, and at length in a passionate peroration demanded, amid loud cries of "Order!" from the Left, what proof there was of loud cries of "Order!" from the Left, what proof there was of "the shameless imputations" of encroachments of the Church on the civil domain, and misuse of ecclesiastical property, which formed the pretext for the new laws. He wound up with a second and "solemn" declaration that "we in the Tyrol will never, never acknowledge such laws, come what may." Göllerich, who followed him on the opposite side, denounced hardly less bitterly the insubordination of the clergy, and concluded his speech with an emphatic assertion of the necessity for a strict execution of the laws, when passed, since the enforcement of the law is the sole adeemphatic assertion of the necessity for a strict execution of the laws, when passed, since the enforcement of the law is the sole adequate basis of the liberty of the people. Another speaker on the same side commended the Bill as "the supreme fructification of the Constitution;" while a third dilated in rather Exeter Hall fashion on the martyrdom of John Huss, the precursor of the Reformation, and reproached the speakers from Bohemia with their unfaithfulness to the memory of the noblest man their nation had ever produced. There was a good deal more oratory of the same kind, which need not be reproduced here. The result of the debate, prolonged to the 9th instant, has been already mentioned. debate, prolonged to the 9th instant, has been already mentioned. We may add that the Emperor has since then telegraphed from Pesth his approval of Herr Stremayer's speech in defence of the Bill.

In preparation for the contest in the Upper House the bishops are assembling in Vienna, where they were to hold a Conference to arrange their plan of action on Thursday last, at which the are assembling in Vienna, where they were to hold a Conference to arrange their plan of action on Thursday last, at which the Bishop of Breslau, whose diocese lies partly in Austrian territory, had promised to attend. And on the 19th the Prince-Bishop of Seckau is to address a general meeting of all the Catholic Unions. No doubt abundant matter for eloquent declamation and gloomy anticipations of the future will be found in the recent course of events in Prussia. At Münster and Trèves there have been popular riots, caused at the latter place by the imprisonment of the Bishop, and the forcible closing of his Seminary by the police; at Münster, by the seizure of the furniture in the episcopal palace, which was put up to public auction to pay the fines incurred by the Bishop for disobedience to the Falk laws. Nor are the Austrian prelates likely to overlook the still more stringent measures just passed, at the instance of Prince Bismarck, by the Federal Council at Berlin, which far surpass in severity even the laws of last May. These last enactments direct that any ecclesiastic (bishops included) who has been deposed or censured by the new Church courts, may be deprived of his rights of citizenship, and, pending the trial of his case, may be "interned" by the police at any place they choose to select. And no ecclesiastic banished or deprived of civil rights in his own State can be allowed to reside or chisain rights of citizenship in any other State of the German Empire without the express sanction of the Federal Council. A short and easy method is thus provided for the parament expulsion of any or all of the German bishops

from their country, and we can hardly wonder if their episcopal brothren in Austria take alarm at even the shadow of any similar scheme of legislation when proposed to be applied to themselves. The cases, however, as we observed before, are not really similar either in form or in substance. And while the practical effect of the Austrian laws will depend very much on the spirit in which they are carried out—for a large discretion is left in the hands wi the Government—it must be remembered there is no Bismarck and no Protestant majority at Vienna. On the other hand, the Austrian Empire, with its heterogeneous medley of nationalities and religions, and its inchoate system of "Home Rule" in Hungary, has difficulties peculiar to itself to contend with, and is hardly likely to press with undus severity on an influential and hitherto well-affected class of its subjects. Political complications are notoriously, all the world over, the opportunity of the Church. But if the Austrian bishops could make themselves very troublesome, as no doubt they could and would under severe provocation, they will pause, if they are wise, to ask themselves in the first they will pause, if they are wise, to ask themselves in the first place what is the real extent of their present grievance, and whether they have most to gain or lose in the long run by fighting a outrance what is, after all, much more the battle of the Roman Curia than their own.

WINTER IN CAIRO,

MURRAY assures us unreservedly that "nothing can be pleasanter or more salubrious than the climate of Cairo during the winter mouths," and undoubtedly he is right as to the rule. But the rule has its exceptions, and this winter has been one of them. We hear that there have been at least a dozen wet days during a couple of months; that the thermometer of a morning has sometimes fallen nearly to freezing point, and that there has been a prevalence of the bitter sirocco winds. Apparently it has been much the same over all the land of Egypt, and even in the lowmuch the same over all the land of Egypt, and even in the low-roofed cabins of the dahabeahs the voyagers have been glad to wrap themselves in extra blankets. To us who are accustomed to the treacherous cruelty of English seasons, and are shivering now under the rigours of an English March, an occasional wet day, a sharp morning, or even a burst of biting winds, may seem comparatively a small thing. We are never sanguine in our expectations of anything better, and thankfully welcome as so much gain anything that savours of Southern summers. We have solidly built houses too—where they have not been scamped by unscrupulous builders—and we were in the way of keeping up blazing fires before our coals went to fancy prices. But when you go abroad to look for summer in winter. prices. But when you go abroad to look for summor in winter, you are proportionately disappointed when you fail to find it. Good fortune in the search may be matter of life and death to yourself or to some member of your party. You burned your boats when you embarked on the Southern-bound stames, leaving all your home comforts behind you, and an English winter in an Eastern house may mean sudden death instead of new life. Even if you went castwards for enjoyment and nothing clse, daily disappointment is terribly fretting to the temper. Your actual if you went eastwards for enjoyment and nothing else, daily disappointment is terribly fretting to the temper. Your actual miseries will be bad enough, but you will sicken besides with the deferred hope of the lotus-eating existence of which you have been dreaming—an existence in which time was to roll along with you on casters, and you were to inhale on soft cushions of rose leaves the exhibitrating fragrance of balm-laden breezes, with nothing to remind you that you still bore the burdens of mortality but some extentionate hetalekenness or idde burdens of mortality but some extortionate hotel-keepers or idle and importunate beggars. In short, when you start for a winter sojourn abroad you stake heavily on the chances of a pro-pitious season. It is true that the chances may be many in your iavour, but that makes it all the worse when you find you have lost; and the further you have gone the more you feel injured when by the freaks of fortune you fare indifferently.

This must be especially the case when you invest in the lottery of an outlying health resort like Cairo. Cairo is a very long way off, and, besides the distance and the expense, there is a

long way oil, and, besides the distance and the expense, there is a great deal to be weighed in going there; but at least you have taken little thought about the climate. You must calculate on the possibility of cold seasons on the Cornice anywhere from Hyères and Cannes to Spezzia; and indeed the natives themselves acknowledge as much by fitting stoves and fireplaces into your apartments. In Rome you often get up of a morning to see the snow-flakes settled thick upon the house-tops, and the Chiaja at Naples is one of the blockest corners in Europa when the at Naples is one of the bleakest corners in Europe when the drizzle-laden wind comes whistling down from Vesuvius. But in drizzle-laden wind comes whistling down from Vesuvius. But in going to Cairo you expect to pass from Europe into something like the tropics. To all intents and purposes you are going to sun yourself in the country of Lalla Rookh and the Arabian Nights, for naturally when you indulged in romantic raptures over your preparations, you did not split hairs about the nicetics of geographical detail. From the hour when you rise to the time you go to bed—for of course you carry with you your indolent Western habits—you expect to be disporting yourself in a bath of perpetual sunbeams. Nor are your earliest experiences of the land of promise by any means unsatisfactory. You are wakened off Alexandria by the hourse rattle of the anchor-chains running out through the hawse-holes, and you hasten in the siriest of morning tollets on to the decks that are being washed by streaming bucketfule of water. You see a blood-red sun rising through a bank of cloud into a cloudless heaven, behind a line of analy beach

broken here and there by a house or a palm-tree. The light breath of the morning scarcely stirs a fold of your dressing-gown. From that time, until you arrive at Cairo, very probably all is pleasure, provided you have secured an intelligent dragoman to see you safe through the ordeal of the beggars and the donkey boys. If Alexandria appeared to be a reflection of the Bagdad of your boyhood although the Oriental life there was so largely diluted with through the ordeal of the beggars and the donkey boys. If Alexandria appeared to be a reflection of the Bagdad of your boyhood, although the Oriental life there was so largely diluted with commonplace Levantine rascality, Cairo is absolutely enchanting. In the general sense of light and brightness, in the exhiliaration of an atmosphere more buoyant than you have ever breathed before you fancy that its gorgeous novelties will never pall. You are transported into the most pictures will never pall. You are transported into the most pictures possibly Hildebrandt. In the gardens of the Uzbekëeh that stretch before your windows, you feast your eyes on the rich vegetation which you had associated hitherto with hothouses at Kew. The heavy masses of the velvety green are relieved by brilliant bursts of bloom on unfamiliar flowering shrubs. The costumes of the people strike you even more than the gay flowers of that brilliant winter garden. Particular turbans may be dingy, not to say dirty; many of the flowing robes may be ragged; but to your dazzled eyes the general effect is unimpeachable. And, after all, the Uzbekeeh is of the Franks Frankish, as you begin to find out when you stray into the Moskée, the former Frankish quarter, and further yet into the genuine Egyptian city. You are lost in admiration as you make your first solemn progress towards the bazaare, where the bright light comes glittering down through hanging coverings of many-hued carpets, from the strip of azure sky high overhead between the hanging roofs. You stare in delighted wonder at the various attractions displayed in a succession of stalls. The articles are so novel and so quaint in themselves that you scarcely realize how many of them are common in material and coarse in texture. Now it is the paraphernalia of the smoker—carved meerschaums and amber monthpieces, gorgeous hookahs and narghileys; now it is a show of fautastic slippers, worked in all manner of golden embroidery, and the moroeco dyed the smoker—carved meerschaums and amber mouthpieces, gorgeous hookahs and narghileys; now it is a show of fautastic slippers, worked in all manner of golden embroidery, and the merocco dyed in such colours as the West will never imitate until it learns to forget the value of time. Again, it is a display of many-coloured handkerchiefs with their broad fringes, or striped coverings of goatwool and camel-hair, or flimsy burnouses with their meandering veins of silk. Or, more characteristic still, it is a show of pottery ware, whose graceful designs have been disinterred from prehistoric tombs. The merchants impress you almost more than their goods. Each time that you are brought to a standstill, you are caught by the glittering eye of some impassive old Turk or Copt, caught by the glittering eye of some impassive old Turk or Copt, squatted cross-legged on the well-worn cushions of his divan, and gazing listlessly from behind his coffee-cup out of a floating cloud of latakia. Nor is it only the life of the city that you see about you in the bazaars. Conspicuous in the crowd are types of wild African life from distant oases and remote deserts. It is the season when the Bedouin come in to dispose of the shearings of their flocks and the garments they weave from them; and for months before the departure of the annual caravan for the Holy City there are pilgrims collecting from all Northern Africa in the hope of paying their expenses by trade. You have opportunities of studying Oriental customs, too, for most of the rites and compressing come off out of doors. Here is a group of nities of studying Oriental customs, too, for most of the rites and ceremonies come off out of doors. Here is a group of musicians and munumers fiddling and screaming before a house where a wedding feast has been in progress for days. There you are entangled in a troop of professional mourners, wailing and howling like jackals among the tombs. And when you have had enough of the town for the time being, there is plenty that is picturesque to be found above it or in the environs. You mount by the steep streets that lead to the citadel, and look out at eventide to where the sun is sinking in the Libyan desert beyond the Nile and behind the Sphinx and the Pyramids. As an American might say, the glow of the sunrise which you admired on landing "was not a circumstance" to what which you admired on landing "was not a circumstance" to what you gaze on now. To say nothing of the memories of those forty cen-turies which Napoleon revived in his lamous bulletin, the lights on the river and the foreground and the distant desert are what you would have called extravagantly impossible had you seen them in a painting. The tumbledown buildings of Cairo itself, the labyrinth of lanes and alleys, have all been swallowed up with their foul details in the broad effect of dazzling glory, and the whole is set off by the mosques with their minarets, and the domes of the tombs of the Caliphs and the Sultans. On the days when you do not feel disposed to climb to the citadel, you have the fashionable road to the gardens of Shoobra, with the lines of sparkling equipages, Frankish and Egyptian; with strings of laden camels; with ambling Arabs of the purest broad; with dark-eyed houris hypocritically veiled in their yashmaks; with the running Syces with their long wands of office, and their crimson-girdled draperies of white. In short, your first few fine days in Cairo fully realize your fondest dreams, and you feel that for months of such unalloyed bliss it was worth while to overdraw your credit with your bankers. of lance and alleys, have all been swallowed up with their foul

But in a brief space of time, even under the most favourable circumstances, you find it borne in upon you that all earthly pleasures are fleeting. The dryness and the warmth of the air begin to tell upon a temperament accustomed to damp and cold. There is little inducement to indulge in pedestrian exercise. There is truef in the Uzbekech, kept up at a vast expenditure on water-works, but everywhere also everything is burned and harren. There are measure of dust lying thick upon the roads, and the trees that line the drives to Shoobra are changing rapidly from green to

grey. The clatter of tongues in the crowded theroughtees begins to deafen you, and the jostling of uncivil Moslems becomes intolerable. When the first impressions of novelty wear all, the goods displayed for sale appear paltry. There can be an doubt that the stenches are horrible, and the people are not much cleaner than their streets or their dwellings. You begin to tire of your life in the hotel. The bedrooms are somewhat bare, the salle-a-manger is decidedly bleak, and the wire covers over everything on which flies can settle are unpleasantly suggestive of one of the most noisome plagues of Egypt. You are losing the fine edge of your appetite, and are inclined to grumble at the monotony of the fare. The fowls are lean, so are the nutton and the beef. Most likely the company borse you; the pleasantest of the guests are mere birds of passage, loitering homeward-bound from India, or else on their way to the Upper Nile. Yet you must remain perforce where you are, for there are not of such exalted degree as to induce the Khedive to place a palace at your disposal. All this is supposed to be in fine weather too; but if the weather breaks, as it has done this season, where are you then? There is no fire in your room, and nothing in the dark salon below stairs but a close and cheerless stove of tiles. Your windows rattle with each gust that shakes them, and the wind comes whistling in under the door and takes dismal liberties with the bit of carpet before your bed. Out of doors the bright blue sky has changed to a chilly grey. Your relaxed frame is chilled and shrivelled by the keen sirecco, which searches out any latent infirmity in the way of rheumatism, neuralgia, or toothache. It fills your clothes, your eyes, and your nostrils with the dust that circles round you in cloudy pillars. You long for rain to lay it, and when the rain comes it makes you only more wretched still. For you must take your stroll shroad through oceans of mud. There is something intensely depressing in the ward damp that envelopes you, and

REVIEWS.

FIGHTE'S POPULAR WORKS.

THE first thing to be observed about the works of Fichte translated in this volume is that, in spite of their title, they are not popular. It seems probable that Fichte himself thought they were, inasmuch as in the preface to the Bestimmung des Menschen he says that he intends it to be understood by any reader who can understand a book at all. We can only say that, if this is true in Germany, German children must be preternaturally wise by the time they are able to read. There is indeed one sense in which Fichte may be said to be popular; instead of expressing himself in the technical language accepted by philosophical writers, he tries to escape from preconceived associations by recasting his thought in fresh and unworn terms. In the same way Berkeley may be called popular in English philosophy. Not that Berkeley is alone among our philosophers in having taken some pains to write in clear English; but the comparison between him and Fichte is one to which we shall have to recur. Just now we have to say that Fichte is decidedly harder reading than Berkeley, being quite as subtle and more involved; and it is well known that divers English and Scotch philosophers, especially Scotch, have not succeeded in understanding Berkeley. On the other hand, Fichte's own text is considerably more intelligible than are any condensed accounts of his doctrine, however well done. But in this there is nothing peculiar.

The Memoir of Fichte which stands at the beginning of this

The Memoir of Fichte which stands at the beginning of this volume is useful and interesting; but we could wish it written in a less magniloquent fashion. We do not want to be told that when Fichte was poor, "poverty, the scholar's bride, knocked at his door." Still less do we care to hear, on the occasion of his accepting a tutorship at Zürich, that "he was to find an asylum in Liberty's own mountain home—in the land which Tell had consecrated to all future ages as the sacred abode of truth and freedom." A serious writer ought really to bear in mind at this time of day that Tell's exploits are not extended even by legand to Zurich, and that he did not in fact "consecrate" Zürich er amy other place, for the sufficient reason that he is a fabulous person. Ample proof will be found in this Memoir that Fichte was an upright man, a true friend, and a devoted husband, and that personal intercourse with him must have been a great fortune to those who enjoyed it. But what comes out above all is the uncessing vigour

Johann Geitlieb Fichte's Popular Works: the Mature of the Substant the Vocation of Man, the Destrine of Religion. With a Maturix by William Smith, LL.D. Louden: Tribiner & Co. 2873. such energy of the man. He seems not to have been happy except in action, and for this he seem had opportunities enough when once his reputation was established. His life as a Professor at Jens was snything but contemplative. He had not been there long before he went to work to reform the manners of the students. He accomplished his object to some extent, but still a disorderly minority made Jens for a season too hot to hold him. In a few years he found himself loudly accused of atheium, and notwithstending that the accusation was wholly unfounded and abundantly refuted, it was so far effective that he resigned his professorship rand migrated to Berlin. There he found a theroughly congenial employment in the foundation of the new University which was part of the great scheme of German regeneration. More than this, he appears to have been to some extent the founder of the Prussian system of national education. Yet, in the face of such facts as these, people continue to talk and write as if speculative philosophers were all mere dreamers, and never left any visible mark on the world. The remainder of Fichte's work at Berlin and the noble and touching close of his life are already familiar to English maders through Mr. Lewes's history, and it would be idle to attempt any abridgment in this place.

It is equally impossible to give within our space any sufficient account of the philosophical contents of the volume; we therefore select the piece which is most characteristic and most complete in itself, the Bestimmung des Menachen. This contains a general outline of Fichte's philosophy written at a time when he was in the fulness of his powers. Some analogy to the way in which he presents the problems of knowledge and being may be found by the English reader in Mr. Tennyson's couplet:—

Dark is the world to thee; thyself art the reason why; For is He not all but thou, that hast power to feel "I am I"?

The germ of the solution offered by Fichte is contained in Faust's The germ of the solution offered by Fichte is contained in Faust's intuitive exclamation, "Im Anfang war die That." From another point of view it might be regarded as a gloritied philosophical parallel to the doctrine of justification by faith. In its arrangement and method the work may be rudely likened to Borkeley's Dialogues tied in a knot, with a Platonic myth tacked on at the end. In form it is a monologue, the speaker not being Fichte himself, but an ideal representative of thunking humanity, whom for accounting the property of the strategic of the strate convenience we will call the Student. The first book is entitled "Doubt." The Student's purely scientific contemplation of the world leads him to a view which may be called a determinist " Doubt." Pantheism. All particular things are links in a chain of necessity; every part of the universe is bound up with every other part, and it is one indivisible force which rules the whole. Conceive the resting-place of a single grain of sand to be changed by a few paces, and you must conceive the whole past history of the world to have been different. I, too, says the Student, am a particular determinate result of the creative forces, partly of those which result in animal life, partly of those which result in thought. Nature contemplates herself from a new point of view in each individual. Every idea (Vorstallung)—we use the word idea in Berkeley's same, but any one who likes may read presentation—corresponds to said is the token of an outward reality. It is obvious that Fichte had studied Spinoza to some purpose, and we are in fact told that early in life he did pass through a stage of Spinozism. The Student had set out with the full purpose of following his reason whither it led him, and accepting its conclusions without erve; but he now finds that his mind revolts against these conchasions. He cannot brook to lose his independence, and become a mere link in the general order of things. He wants to be no slave, but a lord of nature. Feeling that there must be something wrong, he re-examines the path by which he has travelled. He succeeds in hitting upon the doubtful points, but finds that he has no means of coming to a decision either way, and the first book ends in absolute suspense. So far, it will be observed, the question of Edulism has not have saided at all of Idealism has not been raised at all.

The egond book is entitled "Knowledge."

The second book is entitled "Knowledge." A mysterious spirit appears in a vision to the Student, and offers to assist him in his researches. Then follows a dialogue, which goes ever much the same ground as Berkeley, presenting curious likenesses and differences. Both Fichte's Spirit and Berkeley's Philonous pursue the same general road to Immaterialism; a word which it may be proper to remind the reader is no modern figment, but Beskeley's own. In Fichta, however, the course is longer and more involved. As in Berkeley, it is shown that all perception must be perception of a state of consciousness, and that what we call the sensible qualities of objects are known only as modifications of consciousness; and even if it could be imagined that by means of a special organ we could perceive things in themselves, we cartainly have no such organ. The notion of a material substructura is get rid of by a process which in comparison with Berkeley's is clumsy, and which moreover tacitly assumes a good deal of very doubtful physiology. In due course the Student admits that the mality of sensible things in which man naturally believes, whetever cles it may be, is not that unknown "thing in itself," which artificial reason postulates as the cause of sensation. We must now pass ever some more developments, noticing only that there is a daring, but to an English mind quite hopeless, attempt to construct space out of mere consciousness. Any particular change of consciousness is assumed to be analogous to a linear motion, and consequently space of three dimensions, as containing all possible mental varietions. The next definite conclusion is that all knowledge and all consciousness as

the dislague the turn of thought and the expressions remaind one more of Fersier than of Barkeley. And now we came to a notable point of divergence from Barkeley. At the stage corresponding to this Barkeley's Hylas already trembles at a prospect of utter uncertainty, but is rescued from any further confusion by an appeal to the simple consciousness of solf-existence. But Fichte's Student goes on the whole way to Nikilism. Consciousness, he says in effect, tells me not of a self which is one and indivisible, a continuous thinking being which is the substratum of thought, but only of a certain determinate thought at each moment. This is precisely the step which Barkeley refused to take; he assumes as an ultimate fact that the Ego is given in consciousness as real and indivisible, and thereupon proceeds to build up his world anew. But the Student finds in the Ego nothing but a variable factor of consciousness, a mere opposite of the non-Ego, which changes with the changes of the non-Ego at every moment; Ich is only a synonym for Nichtding. The notion of personal identity is an artificial figurent like that of a material substratum. And so the Idealism which at first devoured Materialism has ended by devouring itself, and the student is left to blank Nihilism. He breaks out into reproaches against the deceifful Spirit who has brought him to this pass. The Spirit calmly replies that he has only learnt the conditions of knowledge, and that his mistake was to seek for the reality of things in that quarter at all. "Knowledge is not reality, for the very reason that it is knowledge." There is another way of attaining the long-sought Reality, and the Student may find it if he will. The third and lust book, entitled "Faith," shows how his search is ultimately rewarded.

The Student demands something beyond the sphere of his individual perceptions and independent of them. He seeks a restoration of his natural belief in the reality of the world, a means of confirming the irresistible feeling which tells him there is a reality against the equally irresistible reasoning which tells him there is none. He turns to examine this feeling and see if it can justify itself. How is it manifested? In Action. Action, not knowledge, is the purpose of man's life. Something in his nature forces him to act as if the world were real. As if it were real?—but in the very act of obeying this inner command the Student has revealed to him the true and abiding reality he seeks. He can form and act upon a definite intention, and his purpose as conceived by him (Zweckbeyriff, which might perhaps be rendered final concept, by analogy to final cause), together with the conscious power of realizing it, involves the assumption of a real and independent power quits different from the mere passive capacity for ideas. Here then is the point of contact between consciousness and reality. It is curious that l'ichte does not dwell more on this cardinal notion of the "final concept." It is by no means elementary, and seems open to much consideration. For instance, the reflection is obvious that the concept is presumably made up of materials already given in experience. But Fichte does not stop to notice the doubts that might be suggested on this or on various other grounds. In fact, he is on the peint of

overleaping dialectic procedure altogether.

What then (the Student asks himself) does the understanding. which alone he has hitherto consulted, say to this? nothing; it cannot prevent us from destroying all certainty with interminable and unanswerable questions, but it gives no proof or disproof. The whole matter is left open; what shall we do? We may disregard the voice of nature if we choose, but then life has no meaning. The Student resolves to cast away his doubts and follow the voice. Thus the balance which is left even by reason is turned by faith. The Spirit's dark hint is now understood. Not the Understanding but the Will is the true source of knowledge. The Student believes because he wills. He knows the reality of himself as an agent, and of the voice which commands him to action. Conscience, regarded not as a mere negative warning, but as an active command, is a higher form of the same impulse; and thus from the notion of pure activity the Student passes almost imperceptibly into that of action in obedience to a moral law. Further, the moral command, as we may now call it, involves the reality of the things to which the command relates. Hence the recognition the things to which the command relates. by man of the existence of his fellow-men, independent moral beings like himself, as an absolute certainty; hence also his assurance of the reality of inanimate things. "My world is the object and sphere of my duties, and nothing else." Thus we have come round to a belief which may be called Moral Realism. The process may be shortly resumed as follows: -- Pure contemplation ends in an apparently insoluble problem; the only solution is in action; man has a necessary belief in the reality of his own action, and the world is real because it is the medium of his action.

But the Student's search is not over. He feels a desire, nay a demand (absolute Forderung), for a better world. Then comes a brilliant vision of man's progress on earth. The catastrophic forces of nature will in time be exhausted, and man's conquests will be assured and extended. The anarchic forces of man's own nature will in time be exhausted also. Some day the ideal of a true State will be realized, and when it is once established the typo will spread over the world until all States are free and righteous, and was becomes impossible. But even this is not enough. Nothing more will be possible on earth, and if this finite and stationary result were all, man's destiny would not be satisfied. A still-higher vision opens to the Student. The high command which he has followed reveals to him a world of reason above the world of terms. "Reason's not for the sake of existence, but existence for the sake of reason." This sentence is the watchword of his faith; it saight be taken as the crucial sphorism of all & priori philosophy.

Whoever accepts this must accept some form of Metempirics—to use Mr. Lewes's felicitous substitute for "transcendental philosophy"—whoever rejects it must reject all. And now the intuitive reason shows a super-terrestrial world, not a future life in tuitive reason shows a super-terrestrial world, not a future life in continuation of this, but an ideal world enveloping and pervading this and all other worlds of sense. In that world Will, which we feel to be the true sovereign, but which is apparently baffled in the world of sense, has its full effect. Will is to the ideal world what motion is to the sensible world. As every motion of a particle in space has its appropriate and determinate result, so in the ideal world, in some way which we cannot understand, every right volition has its fulfilment, however fruitless it may seem to us here. And these results will be somehow laid up for us so as to constitute our starting-point for further progress in the next life to constitute our starting-point for further progress in the next life to come, under some finite laws quite different from the laws of the present material universe. This suggestion of an infinity of sensible worlds, each constituted in a way inconceivable to the finite minds related to any other, may be compared with the Attrinatice minus related to any other, may be compared with the Attributes of Spinoza's system. The super-sensual world does not itself belong to a future life more than to the present, or to one finite order of things, or to one moment of time in the same order of things more than to another; it is ever-present and eternal. It is distinctly said that its laws are not as the laws of the sensible world, and that it must not be called in to explain sensible phenomena. Thus the voluntary motion of a limb, considered as an avent in the sensible world is purely mechanical. As for as phenomena. Thus the voluntary motion of a limb, considered as an event in the sensible world, is purely mechanical. As far as the scientific view goes, a connexion of cause and effect between will and mechanical motion is absolutely unthinkable. "In this region of thought the motion of matter, even within my own organism, must be explained on purely material grounds." All discussion, therefore, of any causal connexion between mind and matter is abandoned as wholly vain.

Returning again to the intuition of a moral law, the Student departs in another direction, and finds that the law which rules the super-sensual world must be nothing else than an Infinite Will. This is the spiritual bond which unites the whole world of spiritual existence. Free agents can be aware of one another's existence, and influence one another's actions, only through the medium of their common dependence on this Infinite Will. This is Fichte's answer to the question which is equally troublesome to almost all answer to the question which is equally troublesome to almost all philosophies—namely, So far as concerns me and my world, or you and your world, your scheme may be good enough; but how do you account for the coexistence of you and me in a world somehow common to both of us? And it will be observed that this answer, though very differently expressed, and applied not in the intellectual but in the moral sphere of thought, is in truth the same as Berkeley's. The identity of general method notwithstanding great divergences in treatment and method, notwithstanding great divergences in treatment and daring constructive developments on the part of the later philosopher to which Berkeley would assuredly have had nothing to say leads to results which, if we look beneath the form to their kernel of pure speculation, are identical. The great difference is that Barkeley discretizes from himself and therefore from his reader. that Berkeley disguises from himself, and therefore from his reader, the assumption which overleaps the province of dialectic reason and forms the base of a transcendental construction; whereas Fiche, with an admirable insight and boldness, puts it forth without hesitation in its true character. The work ends in a strain of lofty exultation over the new-found life of spiritual freedom, which contains passages of a beauty hardly surpassed even in Plate. Fighte's rhibarolly is compating system of as a nursely in Plato. Fichte's philosophy is sometimes spoken of as a purely Egoistic Idealism; but the reader who has accompanied us so far will not fail to see that such a term is at least misleading. The importance of the individual Pgo becomes less and less as the Student goes higher in his speculation. Indeed, the relation of the individual to the universe—that is, not the sensible but the ideal universe-assumes towards the end an aspect which, taken alone, would be not inconsistent with a doctrine of Pantheistic Idealism such as was worked out by the Hindu schools. We have designedly abstained from any criticism on this constructive part of the Vocation of Man—not merely for want of room, or because of the difficulty of such a task, but also because Fichto is out of the range of demonstration and criticism altogether if once the fundamental assumption of the Moral Command is accepted. The question whether that assumption be valid is so bound up with the general questions which are at the root of all philosophy that it cannot be answered separately.

The translator of this volume, who is a warm admirer, if not a

disciple of Fichte, will doubtless pardon us for having almost forgotten him. So far as we have examined the translation, it appears to be accurate in substance, though it does not attempt more than is usually attempted by translations in dealing with terms which have no exact equivalent in English. It seems to us that the proper way in such cases is either to grasp the thought of the sentence as a whole, and then boldly recast it without regard to individual words, or else to fix a conventional sense on an English term for the special purposes of the translation, explaining that sense once for all in a note or preface. The common way, which is to use the nearest English word, or perhaps two in the alternative, falls between two stools; thus "conception of design or purpose"does not really translate Zweckbegriff. It also seems to induce a want of straightforwardness and decisiveness even in places where there is no difficulty. We cannot otherwise understand how the three words "Du folgerst rasch" came to be swelled into "Thon formest thy conclusions somewhat precipitately." The propriety of retaining thos in the English throughout the Student's dialogue with the Spirit is a smaller matter on which we are terms which have no exact equivalent in English. It seems to us

inclined to differ with the translator. No doubt any other form of address would under the supposed circumstances be quite impossible in German; but if an English-speaking spirit were to appear and offer to talk metaphysics with us, it is uncertain whether we should feel it necessary to say thou at all, and quite certain that we should forget to say it after the first ten minutes. Seriously, the constant repetition of a form of speech which with us is solemned unusual in a pursuly intellected discussion has a second and unusual, in a purely intellectual discussion, becomes cumbrous and tiresome. However, translations of such works as these are designed for use rather than for artistic effect; and this translation will no doubt be useful both to those who caunot command the original at all, and to those who have some acquaintance with German literature, but may be unfamiliar with the philosophical

THE HEART OF AFRICA.*

IT is impossible to read these volumes without feeling a considerable respect and liking for Dr. Schweinfurth. To many positive merits as a traveller he adds the negative meritnately not so common as could be wished—that he has no quarrel. nately not so common as could be wished—that he has no quarrel with his predecessors. On the contrary, he speaks of them all—Livingstone, Speke, Grant, Baker, and Burton, as well as his own countrymen—with uniform goodwill. We can, however, scarcely reckon amongst his positive merits the power of writing an amusing book. Many passages in his two thick volumes are interesting; some are interesting in a high degree; but there is also a great mass of information which is slightly tedious to the general reader. Few men who have gone through the weary process of long African travel can refrain from indulging in an excessive quantity of detail; and we cannot in candour call Dr. Schweinfurth an exception. The book might have been compressed and rearranged to advantage. However, Dr. Schweinfurth is a German, and brevity is not one of the conspicuous Teutonic pressed and rearranged to advantage. However, Dr. Schweinfurth is a German, and brevity is not one of the conspicuous Teutonic virtues. Of those virtues he has no inconsiderable share. He is a man of scientific training, and especially of great botanical knowledge. He is painstaking in collecting materials, if rather too chaborate in setting them forth. He is benevolent, intelligent, and persevering. The book therefore deserves to be read, and may be skimmed with advantage, by readers of less than German voracity of intellect. As a record of adventure it is not so exciting as the works of some of his predecessors. Dr. Schweinfurth had the advantage of being supported by the Egyptian authorities; and he fell in with a certain Aboo Sammat, who was of the greatest use to him in his explorations. Aboo Sammat appears to have been a man of very unusual qualities for his position. He was one of those rather ambiguous traders whose primary object is the collection of ivory ambiguous traders whose primary object is the collection of ivory from the native tribes, but who do not disdain to do a little slave-trading by the way. His commercial enterprises therefore partock of the character of military expeditions. Notwithstanding this, we are told that he "had the keenest sympathy for learning, and we are told that he "had the keenest sympathy for learning, and would travel through the remotest countries at the bidding of science to see the wonders of the world." The support of this phenix of traders was of the greatest use to Dr. Schweinfurth. The German traveller joined a caravan of one thousand men commanded by the Nubian, and penetrated far to the South from the upper course of the Bahr-el-Gazal, reaching the western slopes of the hills which rise to the east of Baker's Victoria N'yanza; and being the first European to cross the watershed of the Nile from the North. He discovered the singular cannibal tribe of Monbuttoos, and crossed the river Welle, identified by him with the Shary which flows into Lake Tand shed of the Mile from the North. He discovered the singular cannibal tribe of Monbuttoos, and crossed the river Wells, identified by him with the Shary, which flows into Lake Tsad. We shall not, however, dwell upon the geographical questions elucidated by his investigations. Returning unwillingly with his protector, when a few days' murch to the South might have his protector, when a few days' murch to the South might have joined his route with the last explorations of Livingstone, he had some fighting by the way, from which he fortunately escaped without injury to himself or his collections. Unluckily a sad catastrophe deprived him of some of the hardly earned fruits of his travels. Whilst staying at a Seriba, or native trading station, a disastrous fire broke out. He lost all his clothes, guns, and the best part of his instruments. He was left without tea or quinins. His preparations for a new expedition, his large entomological collections, his specimens of native industry, his extensive mecarological observations, his journals, his measurements of native collections, his specimens of native industry, his extensive meteorological observations, his journals, his measurements of native bodies, and the vocabularies which he had painfully collected were destroyed in an hour. He had kept the most valuable treasures by him, fearing to trust them to native conveyances. Those which he sent off escaped, and the remainder perished utterly. The blow was terrible; and we do not wonder that poor Dr. Schweinfurth was for a time painfully depressed. With praiseworthy courage he made another journey; and it is characteristic of his persevering spirit that, having lost all his instruments for measuring, he afterwards measured his distance by that pair of compasses which every pedestrian carries with him, or rather by which every pedestrian is carried. The process, as everybody knows who has tried it, is tiresome enough; but Dr. Schweinfurth heroically carried it out, and in six months had counted a million and a quarter of his steps.

Though his other adventures, which are very modestly described, were not so exciting as those of some travellers, he encountered dangers enough to try his courage. He recloses it as

The Heart of Africa. By Dr. Georg Schweinfurth. Translated by Ellen E. Frever. Leaden: Sampson Low & Co. 1873.

an advantage that he started with a disorganized spleen, and to this he attributes the fact that he escaped the attacks of fever so frequently diseastons in the malarious awamps of Central Africa. But if he was lucky emough to have a diseased spleen, he was not impervious to bullets. It is a pleasant practice of the native solders to be always letting off their guns by mistake, or, if intantionally, with a complete disregard to the direction the bullets may take. Various accidents, some of them fatal, took place amongst his companions from this cause; and Dr. Schweinfurth's escape from some ahots, not perhaps entirely random ones, caused him to be regarded as specially favoured by fortune. Thus from the nettle danger he plucked the flower safety; and the stings of infuriated bees, the assaults of all manner of vermin as numerous and spiteful as those which infested Chuzzlewit's Eden, the rushes of furious buffalces, and other little incidents of the same kind apof furious buffaloes, and other little incidents of the same kind appeared rather a pleasant excitement than otherwise. His enthusiasm indeed in the cause of science would have supported him through greater hardships. A quaint touch of humorous zeal comes out in several anecdotes. Dr. Schweinfurth always speaks of the strocities of slave-dealing and cannibalism as a thoroughly of the strocities of slave-dealing and cannibalism as a thoroughly humans man might be expected to speak. But even cannibalism and slave-dealing have a good side to them. Dr. Schweinfurth takes a great interest in ethnological observations, and consequently any practice favourable to the collection of skulls was incidentally usoful, though primarily detestable. He laments the scandalous maltreatment of a poor dying slave, whose body was finally thrown into the bush; but tells us with quiet complacency that he got the skull some days after. Some of his native allies made a raid upon their enemies, in which, as he says, the "most savage brutalities" were practised on both sides. The younger women taken were destined for the houses of their captors, the middle-aged women for work in their houses of their captors, the middle-aged women for work in their fields, the eldest for their caldrons:-

The skulls in the Anatomical Museum at Berlin [he adds] that are numbered 36, 37 and 38, might be supposed capable of unfolding a terrible tale of these depredations. Some natives brought them to me fresh beiled only a few days after the raid had been perpetrated . . . and as I was not able to bring the poor fellows to life again, I saw no reason why I should not purchase their skulls in the interests of science.

The observations which these skulls (they fortunately escaped the fire) were destined to illustrate are perhaps the most interesting part of the book. Dr. Schweinfurth gives vivid descriptions of the various tribes whom he encountered, and it is curious to remark how widely the various populations differ from each other, though, of course, with many points of resemblance. The Dinkas, for example, are as black as the alluvium upon which they live, whilst the Bongoes resemble in colour the red-brown soil of their district; a Bongoes resemble in colour the red-brown soil of their district; a fact which, as he says, suggests the theory of protective resemblances. They are equally contrasted in many of their habits. The Dinkas are a cattle-breeding race. They have enormous herds of cattle, which, for some reason which Dr. Schweinfurth cannot explain, appear to be in a state of more rapid degeneracy than the English thoroughbred is said to be. They are thin, miserable creatures, giving hardly any milk, whilst the cows rarely calve more than once. But the singular thing is that these Dinkas, though setting an absurd value upon their cattle, never alaughter them. We confess that we are a little nuzzled by the slaughter them. We confess that we are a little puzzled by the statement, because Dr. Schweinfurth, rather inconsistently, goes on to describe their mode of butchering. He declares, however, that they only eat those which have died a natural death, and that then the owner is too much afflicted to be able to taste his deceased property. He thinks that this strange custom may be a relic of an exploded cattle-worship; and we must admit that, whatever its origin, it seems to be a singularly unreasonable eccentricity. The Dinkas have also a superstitious reverence for snakes which infest their houses, and which they are said to know individually by name. Otherwise they are described as an intelligent as well as an affectionate race. The Bongoes, on the other hand, are an as an affectionate race. The Bongoes, on the other hand, are an agricultural tribe, with an extraordinary faculty for digesting the most nauseous kinds of roots and flesh in every stage of decay. They have, moreover, great skill in ironworking, and an enthusiastic love of music. Their creed, however, is limited and not very elevated. They have no belief in God, and translate the name Allah by "loma"—a word which is generally used to signify luck. They share, however, the universal belief in witchcraft, and believe in all manner of goblins and wood-demons. They are much given also to the widely-enread superstition signify fact. They share, however, the universal belief in witchcraft, and believe in all manner of goblins and wood-demons. They are much given also to the widely-spread superstition of lycanthrophy, and fully believe that their old women are in the habit of going out at night and entering the bodies of hyænas. Dr. Schweinfurth got into trouble for shooting one of these brutes, a native Sheikh saying that his mother was a hyæna woman, and that Dr. Schweinfurth might have been shooting her for anything that he could tell. This belief is, he thinks, the whole religion of the Bongoes, who, however, have many amiable qualities, though, like other inferior races, they are destined to rapid disappearance.

The most curious tribes are, in some respects, the cannibals whom he met in his furthest Southern expedition. The widely-spread Niam-Niam tribes, who are addicted to this practice, are said to bear a strong resemblance to the notorious Fans of the Western coast. But the most determined cannibals of all are the Monbattoos. Dr. Schweinfurth stayed for several days at the Geurt of their King Munsa. He describes Munsa as a specially repulsive person, though an intimate friend of his protector Aboo Sammat, and a potentate of great wealth, the splendours of his palace apparently surpassing those of Coomassie. Munza exhibited himself to the travellers dancing in a hideous costume in a large

hall before a large assemblege of his numerous wives. This interesting king of the cannibals was said to have a child killed for his dinner nearly every day, though out of respect for the sensibilities of his guests he tried to keep the practice out of sight during their stay. Twice, however, Dr. Schweinfurth came upon huts where human flesh was being prepared for culinary purposes. The Monbuttoos, he tells us, are "a noble race of men," though their customs are at first sight revolting; and the Berlin Museum has indirectly profited by the abundant supply of skulls produced by their peculiar taste in cookery. It was amongst these Monbuttoos that Dr. Schweinfurth made his most interesting discovery. He met several of the Akkas, who It was amongst these Monbuttoos that Dr. Schweinfurth made his most interesting discovery. He met several of the Akkas, who appear to be the originals of the pigmy tribes of whom we have heard since the days of Herodotus and Aristotle. Once he actually came upon a corps of these Akkas forming part of the King's army; but they departed in the night, before he had time to examine them fully. He became the proprietor of a young Akka, who unfortunately fell a victim to his inordinate gluttony during Dr. Schweinfurth's descent of the Nile. The traveller laments his loss with touching affection, though we do not quite understand in what proportions regret for a follow-traveller and regret for the loss of a curiosity were blended in his mind. The mystery thus revealed is perhaps a little disappointing. The dwarf race of Africa averages about four feet ten inches in height, and appears to be identical with the Bushmen of the Capo. They are strange beings, according to the description given of them, and may in some ways be regarded as a step towards the "missing link." Though diminutive and queer in their notions, they are exceedingly active and admirable hunters. in their notions, they are exceedingly active and admirable hunters. Their skulls are almost spherical, and are so prognathous as to exhibit facial angles of from sixty to sixty-six degrees. In their postures as in their faces they have a resemblance to the apes, and their language is singularly inarticulate. Though we regret the loss of poor Neswue—that was the name of Dr. Schweinfurth's provided the confine that was confined that we would rether any limit to a requirement. loss of poor Nsewue-protégé—we confess t -we confess that we would rather see him in a museum protégé—we confess that we would rather see him in a museum than cultivate a close personal acquaintance. One of the interesting anecdotes related of this young gentleman is his extreme delight at seeing Dr. Schweinfurth boiling the head of a slain A'Banga. He rushed about the camp shouting, "Bakinda he he koto," or "Bakinda is in the pot," with ecstasy. "Such a people," observes Dr. Schweinfurth upon this, "would naturally excel in the inventive faculty of laying traps and snares for game." This may possibly be true, though we do not quite see the force of the argument; but Neswue. however engaging, was slightly objectionable in his Neewue, however engaging, was slightly objectionable in his manners.

We have taken but a few specimens of Dr. Schweinfurth's observations; but we are glad to say, in conclusion, that his book, though rather voluminous, is full of interesting matter, especially for the botanist and the ethnologist. He deserves no small degree of the credit due to the travellers who can describe as well as encounter exciting adventures.

EWALD ON THE PUBLIC RECORDS.

WE should have liked Mr. Ewald's book better if it had been VV less palpably a collection of odds and ends. He first gives us two articles reprinted from the Times, then an alphabetical list of the different classes of public Records, then an article—we know not whether reprinted from anywhere—on the State Papers, and, lastly, a "Brief Clossary of Words to be found in the Public Records." This last, consisting of words of all manner of dates and in various languages, is too brief to be of much use, though it may sometimes help a man when he wants to know the meaning of an old word in a hurry. In the second of the two articles from the *Times* we recognize an old friend. Mr. Ewald wrote the article in the *Times* which provoked an amusing controversy rather more than a year ago. He mentioned the fact that certain shires were not entered in Domesday, and added, with somewhat of simplicity, that this was "for some reason left unexplained." Then, as some of our readers will remember, everybody who knew nothing shout the renders will remember, everybody who knew nothing about the matter, and one man, in the person of Mr. Luard, who did know something about the matter, began to write to the Times to explain the unexplained reason according to his own notions; each man, excepting of course Mr. Luard, sending in a guess more absurd than the guess sent before it. We then took upon ourselves to state the simple facts of the case, facts about which no one who knows the history of those times can have a shadow of doubt. And now Mr. Ewald, while keeping is his test his own remark as it was, does us the honour to quote as his text his own remark as it was, does us the honour to quote us at some length in a note. But it is rather funny when Mr. Ewald calls our simple statement of facts an "opinion." This phrase illustrates a state of mind. Some things of course are matters of opinion. It often happens that men of equal knowledge and equal judgment will differ as to the inferences made from Certain facts, and they will also sometimes differ as to the facts themselves.

This last is in truth the same process, as it means they come to different conclusions as to the value or the meaning of particular pieces of evidence. But there is a class of people who, when one man makes a blunder and another corrects him, think the blunderer rather persecuted, because "every man has a right to his opinion."
We saw the other day a paper in which a man asserted that the
state was only three thousand miles from the earth, and defied all
the matronomers in the world to prove that he was wrong. No-

Cher Public Besords: a Brief Honelbonk to the National Archives. By Elex. Charles Ewald, P.S.A., London: B. M. Pickering. 1872.

body would call this matter of opinion, though men often think that statements on historical matters which are just as absurd are matters of opinion. The Times, for instance, thought it was a matter of opinion whether Alfred founded University College. Some people, we believe, think it matter of opinion whether a wolf suckled Romulus and Remus. So Mr. Ewald seems to see matter of opinion in the plain facts as to the state of certain districts in the days of William the Conqueror.

One statement of Mr. Ewald's about Domesday we do not understand. The sure that the second volume.

stand. He says that the second volume

is in quarto, written upon 430 double pages of vellum, but in a single column, and in a large, but very fair character. It contains the counties of Essex, Norfolk, Suffolk, part of the county of Rutland included in that of Northampton, and part of Laneashire in the counties of York and Chester.

The second volume contains Essex, Norfolk, and Suffolk, while Northamptonshire, Yorkshire, and Cheshire, with the districts which belonged to them then but do not belong to them now, are all in the first volume; and if Mr. Ewald undertakes to talk about Domesday, he really should not leave out the important difference between the character of the two volumes. The volume which contains Essex, Norfolk, and Suffolk answers to the Exon Domesday, and is doubtless the arms original document, itself while the contains Essex, Norfolk, and Suffolk answers to the Exon Domesday, and is doubtless the very original document itself, while the first volume is really an abridgment. The shires in the first volume we have only in an abridged form; Essex and East Anglia we have only in the unabridged form. Wiltshire, Dorset, Somerset, Devonshire, and Cornwall we have in both. Then, while speaking of the origin of the name Domesday, Mr. Ewald should have mentioned that there are plenty of other Domesdays—that of St. Paul's, for instance, whether they were so called in initiation of the great Domesday, or whether they took their names from some common source. Mr. Ewald also should not say, even on the authority of the Red Book in the Exchequer, that Domesday "was begun by order of William the Conqueror, with the advice of his Parliament, in the year of our Lord 1080, and completed in the year 1086." The "deep speech" which King William had with his Witan may by those who do not like English be fairly enough turned into a "parlement," but the date of the deep speech was not 1080 but in 1085. The wonderful speed with which the Survey was made was one of the most wonderful things about it. And it is hard in quoting the Peterborough Chronicler to make him talk about a "virgate of land" when he talks in plain English about a yard; and it is harder still, when he talks in plain English about a yard; and it is harder still, if he is to be quoted, to leave out the choice bit of all:—" Hit is scenme to tellanne ac hit ne puhte him nan scenme to donne."
Again, does Mr. Ewald really believe that "there was already at that time extant a general survey of the whole kingdom made by order of King Alfred "? And what is meant by saying,

In the time of Edward the Elder, we read of the Chancery existing for the making out the royal charters and precepts, and that, as its duties expanded, it became the office of the prothonotary to write, enroll, and pass under the great scal almost every instrument which related to transactions between the king and foreign powers.

Edward the Confessor undoubtedly had a Chancellor, but is there Edward the Confessor undoubtedly had a Chancellor, but is there any mention of such an officer in the tenth century anywhere except in the false Ingulf? About the prothonotary of those days we are quite in the dark: moreover Domesday ought not to be patted on the back and called "That most perfect survey in its way, though made eight centuries ago, called the Domesday Book." All this is a kind of thing which we are used to when keepers of records and libraries—a most useful class of men in their way meddle with the proper province of the historian. So it is an odd way of talking to speak of the Chapter House of Westminster as "The Chapter House, Poet's Corner, Westminster," defining the Chapter House of a church, though now alienated from the church, by the nickname of one of its transepts. And, though the Dialogue de Sencourio was once attributed to Gervase of Tilbury, yet since Professor Stubbs set forth the history of Henry the Second and Richard the First, it should be ascribed to him no longer. And it is a Richard the First, it should be ascribed to him no longer. And it is a strange way of talking to say of those great editions and prelaces, and of those other volumes of the Chronicles and Memorials which are worthy of the company in which they appear, that "different ancient chronicles, illustrative of matters of ecclesiastical and archeological interest, have also appeared, edited by able palsographers and antiquarian scholars." The history of the first two Angevin Kings, and—as Mr. Ewald also talks of the Calendars of State Papers—we may add the reign of Henry the Eighth, are something more than matters of ecclesiastical and archeological interest, and their historians are something more than able palsographers and antiquarian scholars. palmographers and antiquarian scholars.

palseographers and antiquarian scholars.

But with all this, which is only what we should expect from "one of the senior clerks of Her Majesty's Public Records," we are glad to hear all that Mr. Ewald has to tell us as to the history of the Public Records, their evil case in past times, and how much better they are looked after now. And one thing strikes us throughout, that all through the centuries when they were left to rot, to be eaten of rats, to be piled up in sheds, or to undergo any other horrible fate that might happen, it seems never to have been the fault either of the King or of either House of Parliament. The House sent up addresses, Kings sent out orders, but the thing never seems to have been done. One reason doubtless was that there were no proper officers to look after the Records. The Records were seattered about here and there in all manner of unfit places, in the heads of underlings who cand nothing about the Records themselves, and thought only how they might serew fees out of those who wished to consult them. Mr.

made Keeper of the Records in the Tower under Charles the Second, and he also quotes a Report of a Select Committee of the House of Commons in 1836, giving an account almost as pitful, though not quite so graphic in language, of "4,136 cubic feet of National Records deposited in a most neglected condition" in sheds in the King's Mews, Charing Cross. Among the documents were various skeletons of dead rate, and the live ones had to be hunted out by a doc. Pity that pobely amilia. live ones had to be hunted out by a dog. Pity that nobody could be found with the cursing power of St. Ivor, who, according to Giraldus, cleared the land of Ferneginan of those animals without the help of a dog:—"Unde mures majores, qui vulgaritar rati-vocantur, per imprecationem sancti Yvori episcopi, cujus forte libros corroserant, prorsus expulsi, nec ibi postes maci, nec vivere libros corroserant, prorsus expulsi, nec ibi postes m valent invecti."

When attempts were really made to mend this seate or sample, they were not very successful, as long as what was done was to appoint large Commissions, consisting mainly of men who had plenty of duties of other kinds. The Records could not be properly looked after till they became more distinctly the special training of a smaller set of men. Such a staff has been organized When attempts were really made to mend this state of things, perly looked after till they became more distinctly the special business of a smaller set of men. Such a staff has been organized under the Master of the Rolls, with what good effect every one knows. But this has been largely because the Master of the Rolls has been Lord Romilly. It cannot be taken for granted that every Master of the Rolls will be full of Lord Romilly's spirit, nor does there seem any good reason for attaching the duty to that of an Equity Judge, to say nothing of what may happen when the Judicature Act comes into force. The Public Records should surely form a public department to themselves, and such a department could not start under a better chief than Sir Thomas Hardy.

Mr. Ewald has also something to tell us about the State Papers, as well as about the Records strictly so called. He describes the care with which they were so long shut up from everybody save those who could get a special permission from a Secretary of

As an instance of the strictness with which the State Papers were guarded we read that as late as 1775 Lord North, then prime minister, begged "the King's approval to have free access to all correspondence in the Paper Office"; and in 1780 it was necessary for the Ordnance Office to have the Secretary of State's permission to "search the Paper Office for any documents that regard their department."

It is worth notice that in Queen Anne's reign Jeremy Collier had leave to make use of the State Papers when writing his Ecclesias teave to make use of the State Papers when writing his Ecclesias-tical History, his outlawry doubtless being, under the orthodox Queen, looked on as practically set usede, though it never was for-mally annulled. Here again Lord Romilly has come to the help of historical students, and the State Papers, as Mr. Ewald says, may now be consulted as easily as the books in the reading-room of the Heitish Museum. of the British Museum.

Of Mr. Ewald's Glossary we have said a few words already. But it shows in several places how the researches of sound scholar-ship do bit by bit make themselves felt. We have, for instance, definitions of Fideland and Bocland which may quite pass muster, though, if we are to have a glossary at all, we want a little more, and a reference or two. In one definition we are not sure that Mr. Ewald's zeal does not carry him too far; we do not quarrel, but we are not quite sure that Professor Max Muller might not, with the following entry in his Glossary:—

Cyning, a king, a son or child of the people, manifestly a patronymic, like Uffing, son of Ufla, &c.

So it does seem manifest to a plain Englishman; still we have a kind of painful vision of a Sanskrit ganaka hanging before our eyes. But it is better to take the bright side of things, to turn our eyes away from the ganaka, and rather to rejoice that we have at any rate got rid of the canning or cunning man.

EMANUEL DEUTSCH.*

MANUEL DEUTSCHI was one of the few men who in a short life have done very much, and have done everything well, and whose greatest grief has been caused by their inability to He had toiled with indomitable energy in that vast fie of later Jewish literature which has exercised on the thought, the philosophy, and even on the legislation of Europe an influence not easily to be measured, but which remains for all but the scantiest minority of scholars an unknown, if not a repulsive, wilderness. In this wide region it had been his hope to work the rich mines of knowledge which even for the most diligent and clear-headed of workmen must be at first, and perhaps must long remain, an almost inextricable labyrinth. By incessant industry, sided by a learning which ranged over all that might illustrate and bear upon his special subjects, he had more than laid the foundations of the great fabric which he hoped to raise; and when he came for-ward to show English readers some results of his labour, and to point the way to researches promising a richer harvest, he was re-

point the way to researches promising a richer narvest, he was received at once as one who could speak with authority, and who had taken a foremost place among European scholars.

In spite of the vivacity and elequence of his language, and of illustrations from the literature both of the success and the modern would which threw life into the least inviting portions of his subject, the treatises which won for him a great name addressed themselves chiefly to men of more than ordinary culture, bearing,

^{*} Library Remains of the late Emanual Destroit; with a brief Ma. London: John Murray. 2874.

and seal for imouledge. For these every page would show that they were reading the words of a man in whom the highest mental powers were united with intense carnestness; but it was impossible for them to knew how vast a work this man had planned out, how great were the difficulties which he had surmounted, and with how mighty a fire his genius and his energy, in no mere figure of speech, were consuming themselves. Then came, a few years—it might almost be said a few months—later, the story of falling health, followed, after a short interval, by the tidings of his death. The volume which bears his name must remain perhaps the only memorial of one who, whatever verdiet might be passed on his work by others, could never be satisfied with it himself; but for those who never saw him, much more for those who were his friends, the most instructive, certainly the saddest, portion of this volume is the memoir which tells the story rather of his thoughts than of his life.

The attempt to criticise in a few sentences or paragraphs treatises chick are the fruit of a learning as wide as it is deep would be so which are the truit of a learning as wide as it is deep would be so idle a task that we may be forgiven for speaking at present about the man rather than about his work. Few probably will read the first page of this short megacir without being reminded of the earlier years of a man singularly unlike Mr. Deutsch. Apart from any opinion as to the truth or the falsehood of the teaching to which Mr. John Stuart Mill was subjected almost from his infancy, Mr. James Mill's system of education has with scarcely a discontinut voice here denounced as ingeniously and substitutely. utient voice been denounced as ingeniously and relentlessly.

That system out the child off from his fellows, put a strain on his mind which, whatever might be the result, must in itself be highly dangerous, and, by turning his thoughts into channels of attaining the hardware which we was dilimeter had before him as the one the happiness which yet was diligently held before him as the one end and aim of all human effort and all human knowledge. From quite other motives and for very different purposes, Mr. Deutsch ras subjected to a training which, if not so cruel, was even arder. James Mill, while he stuffed the brain of an infant with the most abstruse arguments of Plato, was yet not such a simpleton as to forget that mind and body alike need a due amount of relaxation. From fresh air and exercise accordingly the younger Mill was not debarred; and the keen delight which he found in botany aided not a little to prolong his life to old age with undiminished vigour. The good sense thus shown by the elder Mill seems to have been wholly lacking in the uncle who, after long and carnest entreaty, obtained from the parents of Mr. Deutsch the charge of their son. A man of great learning, who had made the Talmud his special study, he had no scruple in taking a child st eight years old and compelling him to leave his bed at five o'clock during winter and summer alike, and to study without fire or food for one or two hours, until the time for daily prayer, which took up another hour. The rest of the day until eight o'clock at night was passed, we are told, in close application to books, "one quarter of an hour being the only time allowed for recreation, and about the same for exercise and fresh air." For five years the child had to struggle on under this crushing burden; and the biographer may well add that he used to look back to those years with painful self-pity, although his attachment to his uncle was profound and tender, and his gratitude to him unbounded.'

Possessed of a remarkably robust constitution, Mr. Deutsch found himself at an early ago attacked by a disease of which neither he nor his friends suspected the nature, but which inflicted on him fearful agonies in its conflict with his great natural strength. It needs, however, no profound medical knowledge to see that the system under which he was brought up just at a time when the healthy and unrestrained action of all the, bodily organs is most of all indispensable, was amply sufficient to lay the foundation of deep-seated and insidious disease, or at the least to predispose the body to fatal disorder. He had not reached his fortieth year when this disease first began to show its effects. Up to that time he had enfoyed what seemed to him a robust health, which tempted him to disregard the ordinary precautions needed to preserve it. He had acquired the habit of almost incessant toil, and taught himself that he could scarcely afford time for dinner, certainly none for idleness. We may set down these mistakes as causes tending to hurry on any malady by which he might be attacked; but there can be no reasonable doubt that the involuntary slavery of the solitary of any must be infinitely more mischievous than the hardest toil of the grown man, who has no mean relaxation in the society of his friends, and in the mare consciousness of the purpose for which he is working. Nor can it well be matter for surprise when, by a discovery made too late, his disease was found to be cancer. The outdoor amusements of an English public school would in all likelihood have insured for him a hale old age; and learned philosophers like Mr. Dentach's uncle are unwittingly guilty of acts which can be fitly described only as alow murder.

But, in spite of this caninous beginning, his sound sense and his dasply religious life brought to Mr. Deutsch a larger share of happiness than fell to the lot of the distinguished thinker with whose childhood his own exhibits some likeness. He was able at an early age to see that circumsteness had given him special advantages for the acquisition of that knowledge which was for him most precious, and that in the great field of mental toil his lines wast east in pleasant places. He could feel that not every key of a most precious, and Virgil on his booksies standing by the side of the Mischanh and the Midrash, or could be steaped in the create and the Takanud before he was introduced to the Alasdamia of Plate and the friends. He could appreciate the living men from whom

he drank in wiedon; Bäckh, from whom he learnt to see the Athens of Pericles and Themistocles in the fulness of its 1752; Meincke, who taught him Horace by the light of Herman and Heine; Ranke, who showed him "the bright germs of those goodly trees of freedom under whose shadows the peoples of Europe now dwell"; Ritter, who "discoursed of all plants, from the coders of Lebanon to the hyssop that grows in the ruins of Vizagapatam." Lastly, he could exult in his sejawrn of twenty years "in the midst of that Pantheon called the hiritish Museum," "the treasures of which were at his beek and call all days and all hours—Alexandria, Rome, Carthage, Jerusalem, Eidon, Tyre, Athens."

The work which he crowded into these twenty years was prodigious, but the hundred and ninety essays and articles written for Chambers's Eacyclopedia, for the Dictionary of the Bible, and for Kitto's Cyclopedia of Biblical Literaturs, with the articles in the Quarterly Review on the "Talmust" and "Islam," were, as he hoped, merely preparatory to the great task of his life—a complete Treatise on the Talmud and other portions of ancient Jewish literature. He had resolved to ascend a great mountain, but the depression which overtook him on the way can scarcely be accounted for by the labour of his maturer years alone. We may mark the utterances which bespeak an overwrought apirit, even immediately after his return from the East, where he had found "all his wild yearnings fulfilled at last." His one great effort, in all his work, had been to realize the life of the men who left as their bequest to posterity the vast mass of Hebrew lore in the Talmud and other Commentaries on the Bible. For years he had toiled on in something like confidence that he should be able to do this. In the very prime of manhood this confidence deserted him, and he began to regard as a rash task the attempt to "resuscitate a time which perhaps, after all, had better remain dead":—

Who knows? [he asks] perhaps, after all, I may be only and really ln-a dream, while I fancy I see golden towers and palaces gleaning in the derk blue depths, streets, and market-places crowded with a motisy crew—Roman, Greek, Byzantine, Jewish, Indian, and the rost—hearing the vague wild hum of strange dead voices, and seeing, above all, the weird, strained look in their eyes which prays and implores unceasingly—Redeem us. . . . What will it avail anybody when I have proved to ocular demonstration that they had wisdom, and prowess, and honesty, and wit, and humour (which is more), and passions, and love in those burned days? For, after all, this is the end of all investigation into history or art; they were even as we are. Why, therefore, not be satisfied with this general result?

The light around him and within him was, in fact, being overclouded by the darkest shadows. He was utterly oppressed by a sense of the futility of his own self-sacrifice:—

It is that [he says] I might be a thousand times more useful to my immediate friends by not giving myself up thus utterly to labours which, taken all in all, will amount to but very, very little, in the long run. I may prous and bring out a few details; I may teach a few—and these generally don't need to be taught this—that man is not bad from the beginning, and certainly not because he does not happen to dress and eat quito in the approved fashion. But, after all, what is the having done this compared to a real good, active, useful life, when days mean days and nights mean nights; a life not a prey to all kinds of haunting things, and one which has a real—not a so-called ideal—aim and purpose?

These are the expressions of a mind not only overwrought, but fairly oppressed with toil; and it would be a gross injustice to put down such words to the temper which leads most men to see the benefits or advantages of other callings in strong contrast to the drawbacks of their own. We have here not the discontent to the drawbacks of their own. which, in the old phrase, makes the ox wish to be saddled and the horse to try the plough, but the exhaustion which follows an excessive application of mind in one special direction; nor is it possible to determine exactly how far this may or may set have possible to determine exactly now ar this may or may set have been the result of the fatally mistaken system to which he was subjected in his childhood. The dissatisfaction, however, arises in part, we can scarcely doubt, from the nature of the subject to which he devoted the labour of his life; his discouragement is caused by the difficulty of presenting the men who raised the "vast mounds of Chaldee literature" as really living men before the eyes of modern Europe. The difficulty is not felt by those who have to deal with the wit, humour, and jokes of Aristophanes, the genial learning of Herodotus, the wisdom and energy of Pericles and Themistocles, the consummate generalship of Hamibal, Alexander, and Caesar. It would be quite otherwise if all our knowledge of these men, nay, of all Greeks and all Ronans, were gained from books in which their biographics were jumbled up with the whole body of Greek and Roman law, proverbs, habits, customs, ritual, tradition. But this is precisely, in Mr. Deutsch's words, the luxuriant Talmudical wilderness in which the modern investigator finds himself plunged, and in which to one "schooled in the harmonizing and methodizing systems of the West" "everything seems tangled, confused, chaotic." He will see, it is true, if thing seems tangled, confused, chaotic." He will see, it is true, if he perseveres, that there is an order running through this chaos; but he will also see that of the two great currents of thought, which sometimes run parallel, and sometimes appear to meet and to cross each other, one seems to the Western mind, if not to turn fact into fiction, yet at least to make anything out of anything. If the legal portion exhibits a terrible intricacy, the Western scholar is apt to be still more repelled by the imaginative portions in which the historical as well as the prophetical and ethical parts of the Hible are "transformed into a vast series of themes almost masseal in their wonderful and capricious variations." That no profit is to be got from digging in these mines it would be rush and toolich to any; but for any one man life is not long enough for the tesk of bringing the contents of Tahmud, Targum, which sometimes run parallel, and sometimes appear to meet and

Mischash, Midrash, into shapes that would make them as readily

accessible as is the literature of Greece or of Rome.

In this great task Mr. Deutsch has done more than merely break ground; and probably even of the few who expressed their admiration of his Quarterly articles on the Talmud and on Islam not many saw fully the momentous issues involved in conclusions which to Mr. Deutsch seemed to be demonstrated. From this vast and mysterious storehouse of ancient learning, and from this alone, can we, in his belief, gain "a real notion of the mental atmosphere, of the dogmas and doctrines, the ethics and ceremonies, the prose and the poetry of the time when Christianity was born." From this alone can we determine the measure in was born." From this alone can we determine the measure in which the thought of ages long preceding the Christian era has mingled itself with beliefs which are assumed to be exclusively Christian, and the measure of the common elements in the conflicting religions of the Eastern and the Western world. We may regret that a life spent on a task from which we might look for vast results has been cut affort by excessive toil; but although it may have seemed so to himself, his work has not been in vain; and the Hebrard lines carved on his grave at Alexandric hear the and the Hebrew lines carved on his grave at Alexandria bear the true legend that his broast was burning with good things, and that his pen was the pen of a ready writer.

TWO LITTLE WOODEN SHOES.

WHEN on one occasion the Duke of Wellington wished to W IIEN on one occasion the Duke of Wellington wished to give a dinner to a thousand men, he ordered his cook to bring him a list of the dishes that would be required for a plentiful meal for fifty. Having received this, he told the man to repeat each dish twenty times, and he would then have the number he really wanted. On some such plan as this does the author who under the absurd name of "Ouida" writes novels no less absurd awell out her story to the proper size. She has in the present instance been so moderate as to content herself with one volume and with 322 pages. If however, we are not mistaken as to the and with 322 pages. If, however, we are not mistaken as to the plan she pursues, she began by writing her story, as it very well might have been written, in some twenty or thirty pages. We imagine her sitting down with a large folio before her, and writing only one sentence at the top of each page, leaving the rest of the sheet blank. When she had come to that end which she of the sheet blank. When she had come to that end which she means to be so sad, but which her critics find so pleasant, and had killed off her heroine, she then no doubt began all over again, and filled, up the blanks she had left by repeating ten times or so, though in slightly different words, the sentences that stood at the top of each page. We might also liken her to the prophet of old, who, when he had ordered a given quantity of water to be record over the sacrifice, had it nouved a second time, and again poured over the sacrifice, had it poured a second time, and again third time. Or, better still, we might liken her to the member for Peterborough, who, when he has said a foolish thing once and

whird time. Or, better still, we might liken her to the member for Peterborough, who, when he has said a foolish thing once and got into trouble for it, says it again and gets into trouble again.

We must bring our comparisons to an end however, else our readers will accuse us of repeating ourselves as much as "Ouida." The plot of Two Little Wooden Shoes is as simple in its manufacture as the shoes themselves. A child is saved from drowning in the first chapter, in order that she may in the last chapter down herself in the very same piece of water. An old man, fifteen years before the story opens, "had seen a grey bundle floating among the water-lilies in the bit of water near his hut, and had hooked it out to land, and found a year-old child in it, left to drown no doubt, but saved by the lilies, and laughing gleefully at fate." The ununknown woman who had thrown it in "had left it there to drift away to death, not reckoning for the inward ripple of the current of the toughness of the lily leaves and stems." No doubt "drift away to death" has a very pretty sound about it, though not much sense. A child thrown into a pond is not meant to drift away anywhere, but to go straight to the bottom. In "a little piece of water," too, there are not currents to be found, and even if there were any, what would the ripple of the current have to do with it? If by "inward ripple of the current "the author means to say that the wind was blowing to the bank from which the child was thrown, why does she not say so? But then, if it was the inward ripple or wind that saved the child, how about the lilies which must have stopped it from maxing and then, if it was the inward ripple or wind that saved the child, how about the lilies, which must have stopped it from moving, and which nevertheless saved it too? The author is welcome, if she likes, to let "the inward ripple of the current" of a pond bring a which novertheless saved it too? The suitor is welcome, it are likes, to let "the inward ripple of the current" of a pond bring a year-old child to the shore, as she is welcome to let the lilies uphold it, but she cannot have both at the same time. Leaves and stems of lilies will not hold a thing up and let it pass also. As for a child laughing gleefully at fate when found early in the morning floating in a pond, although we cannot pretend to have much knowledge of a year-old child's laughing at fate, we are experienced enough to feel sure that it would at the same time have been squalling at the cold water. Be this as it may, the child was brought up by the old man who found her, and helped him in his small garden and went with him to sell flowers in the great square of Brussels. They had sharp times of it in the winter, when "the country gardens were bitter, black, wind-swept desolations, where the chilly roots huddled themselves together underground like homeless children in a cellar." Black desolations as the gardens were, yet at the very same time "the pinnacles of Ste. Gudule were all frosted white with snow." But in a country

* Tree Little Wooden Shoes: a Shetch. By Quida, Author of "Chan-des," "Trioutrin," "Under Two Flags," &c. London f Chapman & Hall.

where chilly roots can huddle themselves together, and, while they where chilly roots can huddle themselves together, and, while they huddle themselves in the place where they have always grown, are like homeless children; in a country, too, where things are frested white, not with frost, but with snow, it is not surprising if the wind should leave the snow to lie on a pinnacle while it sweeps it out of the country gardens. The old man had odd notions of gardening, for, as the girl—Bébée she was called—once "said reproachfully to the great gaudy gillyflowers and the painted sweet-peas, 'He never let you know heat or cold; he never let the worm gnaw or the snail harm you; he would get up in the dark to see after your wants; and when the ice froze over you, he was there to loosen your chains." Whether worms gnaw gaudy gillyflowers or painted sweet-peas, we are not naturalists he was there to loosen your chains." Whether worms gnaw gauny gilly flowers or painted sweet-peas, we are not naturalists enough to say. Perhaps worm is used in its widest sense, and includes all creeping things. We are more puzzled about the ice that froze these summer flowers, and more, puzzled still about the manner in which the gardener loosened their chains. However, even if old gardeners are not to be found getting up in the dark to scrape the ice off gaudy gillyflowers and painted sweet peas, "Ouida's " passage rends very prettily, and to a person who never happens to have seen a garden or ice, perhaps it has a certain air of truthfulness. So, too, may another passage where we read that "the buckets hung at the bottom of the well, and the flowers hungered in vain, and the neighbours held aloof, and she shut-to the hut-door, and listened to the rain which began to fall." How the buckets hung when they were at the bottom of the well, and how the flowers hungered for water, instead of thirsted, and how they hungered in vain at the time when the rain was beginning to we cannot pretend to say.

"Ouida" is always being carried away by the inward ripple of the current of her own flood of words, and there is no one at hand to hook her out to land. She has got what she someof the current of her own flood of words, and there is no one at hand to hook her out to land. She has got what she somewhere calls "all the fantastic luxuriance of fancy," with no judgment wherewith to guide it. In one place she describes how the people years before, "in their babyhood, had run out of their huts fearful, yet fascinated, to see the beautiful Scots Greys flash by in the murky night." If the beauty of the Scots Greys was to be dwelt upon and their flashing by, the murkiness of the night need not have been dwelt upon. In another place she writes that the ships lying in the cannal at Brussels had "about them the sweet, strong smell of that strange, unknown thing, the sea." This, when translated into the language of common sense, doubtless only means that the ships smelt rather strongly of bilondoubtless only means that the ships smelt rather strongly of bilgewater. A cabin-boy of one of these ships was almost as good at words as "Ouida" himself, for "he would try and make Bebee understand what the wonderful wild water was like—now black as that thunder-cloud, now white as the snow that the winter wind had that thunder-cloud, now white as the snow that the winter wind had tossed, now pearl-hued and opaline as the convolvulus that blew in her own garden." Brussels must rival even Wapping in marine curiosities if it has ships that have smells which, though strong are yet sweet, and cabin-boys who use such fine words as pearl-hued and opaline. A ship we notice, by the way, which was to go from the wharf at Brussels to Norway, "was to be back in port in eight months, bringing timber." "Ouida" would be far safer if she were to keep as indefinite as possible. Even one of her ordinary readers must see the absurdity of a ship taking eight ordinary readers must see the absurdity of a ship taking eight months to go from Belgium to Norway and back. A few pages later on she tells of a girl eating red and white currants on the very day when the man she was in love with gave her a branch of white pear-blossom. "Ouida" makes almost an estentatious display of her betanical knowledge in this story, and yet she has the pear-tree in blossom and the current-tree in fruit at the same time. However, the pear-blossom gives her, what she always wants, a senti-mental ending to the chapter:—

Bebee had only one sorrow that night. The pear-blossoms were all dead and no care could call them back even for an hour's blooming.

"He did not think when he struck them down," she said to herself

We have a scarcely less wonderful phenomenon than this in those "salt sea-fed rapids" in which the wicked hero had been described as "swimming all his life." "Ouida" would hold, it seems, "sait sea-ted rapids" in which the wicked here had been described as "swimming all his life." "Ouida" would hold, it seems, that all the rivers do not run into the sea, but that some run out of it. But the country about which she writes is every way remarkable. "The May days," she tells us, "are short in the north lands of the Scheldt." Does she really think that the further south you go in summer the longer are the days? and has she ever been in Belgium—we might say in England—in May, that she says that in these latitudes the May days are short? There is no nonsense that she will not write if only she can get a fine sound out of it. In Belgium" bees boom," for instance, and, when a child pulls open a rosebud, get "into its tender bosom." How fine is the following description of a train:—"A great iron beast rushed by hex, snorting flame and bellowing smoke" (why not bellowing and booming smoke?); "there was a roll like thunder, and all was dark; the night express had passed on its way to Paris." As, however, the station through which it passed at full speed, without stopping, was Brussels, the author has consulted "fantastic fancy" rather than bradshaw. Perhaps we can give no better notion of the luxuriance of this fancy of hers than by quoting the passege in which she paraphrames the vulgar fable of the cock scratching up the jewel on the dunghill:—

It is of no-use to simpt the little chaffineh of the woods with a rulti in the little chaffineh of the woods with a rulti in the little on the leavest better. The bird is made to feed on the brown better, on the country that the scarlet hips of roses, and the blossoms of the wind-ball the little had gon, though it be a material's, will only strike had

The snake plays a great part in "Oulda's" curiosities of natural history. The wicked here on one occasion was stroking the heroins's hand, "es a man may stroke the soft fur of a young cat," when "Bébés looked up with a sudden and delicious terror that ran through her as the charm of the anake's gase runs through the be-wildered bird." The comparisons indeed are somewhat confusing wildered bird." The comparisons indeed are somewhat containing officen the heroine is first a young cat and then a bird, and the hero a man and a snake; and we doubt whether, as the author would seem to imply, there is anything delicious in the terror that a bird feels when bewildered by a snake. In another passage we have a woman described as "a beautiful brown wicked-looking thing like some velvet enake who leaned over him as he threw down the painted cards upon the lace, and who had cast about his throat her curved bare arm with the great coils of dead gold all a-glitter on it." In the old Christmas ballad we remember how Dives was described as "sitting on the serpent's knee." "Ouida" would seem to give the creature arms also. The birds that figure in the story not quite so remarkable as the anakes, though, when the heroine are not quite so remarkable as the snakes, though, when the heroine had drowned herself, "the starling poised above to watch her as she slept." The swallows, however, were not so attentive to her, for "they would never tell her snything of what they saw in winter over the sees. That was her only quarrel with them. Swallows do not tell their secrets. They have the weird of Procne on them." We wish some of our authors could get any kind of weird on them, so long as it would keep them from writing nonsense. "The Sun also held his peace;" but here we will let "Onida" greak for herself:— "Ouida" speak for herself:-

1 30 July 18 1

But the Sun shone on and held his peace. He sees all things ripen and fall. He can wait. He knows the end. It is always the same.

He brings the fruit out of the peach-flower, and rounds it and touches it into ruddiest rose and softest gold; but the sun knows well that the peach must drop—whether into the basket to be eaten by kings, or on to the turf to be eaten by ants. What matter which very much after all?

The Sun is not a cynic; he is only wise because he is Life and he is Death, the creator and the corrupter of all things.

It would have been well if "Ouida" had contented herself with all the luxuriance of silliness. She has chosen however to write in a way which a very few years ago would have been thought offensive even in a man. The taste of the novel-reading world is corrupt indeed. While such miserable works as those which corrupt indeed. While such miserable works as those which "Ouida" writes find a ready sale, there has for years been no reprint of Miss Edgeworth's novels. There is no great wonder that in an age when such a silly and disagreeable story as Two Little Wooden Shoes is in great demand there is not to be had a copy of Helen or Patronage.

BARON AMBERT'S HISTORY OF THE LATE WAR.

ONOGRAPHS on various parts of the War of 1870-71 have appeared, do appear, and will undoubtedly continue to appear, with a profusion never before heard of. Our table is even now loaded with a new set of such volumes. But until recently there has been no serious attempt to compile a trustworthy history of the whole conflict up to its close; for Rüstow's work, one of the series which that prolific writer has put forth avowedly to meet the immediate market demand, before even the newspapor reports of the war were concluded, can hardly aspire to be counted as history at all. Indeed to us it seemed, when viewed as a first narrative only, a remarkably incomplete one, the viewed as a first narrative only, a remarkably incomplete one, the author having sent his parts one after another from the press without having acquired any sufficient information from that side whose doings are always the most obscure—the one that was defeated in the struggle. This was in some sense excussable, for partial cortain of the Exercise groundly undertook to tall their own feated in the struggle. This was in some sense excusable, for until certain of the French generals undertook to tell their own stories, and M. Freycinet's bulky volume was opportunely issued as though expressly to confirm their complaints of the shortsighted and meddlesome character of the Tours War Office, there was no possibility of framing an account of the campaigns on the Loire and Somme that would satisfy any impartial person. The French generals, by the way, have been severely censured in Germany, and spoken unfavourably of among ourselves, for committing to print their narratives, of which a necessary element was an exposure of their countrymen's follies and mismanagement. But those who this seem to us to take an overstrained view of what patriotism ramuires from the soldier. The French commanders have not been requires from the soldier. The French commanders have not been more prolific than the German staff in works on the various sections of the war; and if there is more that is unpleasant for them to tell, such could hardly fail to be the case with the party that suffered so severe a succession of defeats. Be the reader's judgment on this point what it may, he will at any rate hardly be unthankful to them when he finds that their fragmentary stories have enabled Baron Ambert to weave together the threads which connect the various portions of the war, and to present us with a single volume in which we may trace the whole course of events. even months which ended in leaving g the momentous se country once so proud of her military prestige prostrate at the querors' feet.

conquerors feet.

Haron Ambert became very favourably known among ourselves some ten years since by his studies in Tactics, the most complete work of its kind that was then to be procured. It embodied the results of the Napoleonic era, and carried them on down to the data when they were slightly modified by the appearance of the Ministrial the rifled gun in the Italian fields of 1859. The wast tactical

revolution since introduced by the breechloader has made lessons drawn from that era of little more value than a study of the battles of Gustavus or Frederick. But in his day Baron Ambert did good practical service, especially by his expectate of the fallacy of a notion very current at the time of Solferino, that armies were about to be changed into parks of long-range camon, and that infantry and cavalry would cease to be the principal factors in war, and take the humbler part of mere escerts to the guns that were to fight the actions. Absurd as this theory seems now, when all the military world is straining after the technical improvement of foot and horse, it was popular enough fourteen years since, and Baron Ambert was the writer to whom we in England, as well as his own countrymen, were most indebted for its successful refutshis own countrymen, were most indebted for its successful refuta-tion. He writes in the present work in the same agreeable style that he then used, one more gossiping perhaps than accentific— a fault which increasing years have rather developed, but which will not be unpleasant to the general reader. He has used carefully the best authorities available on either side, and speaks as far as pos-sible from the best sources of history, eyewitnesses of the facts recorded, though he gives, as is natural, rather too much was the

recorded, though he gives, as is natural, rather too much weight to the views of his own countrymen and comrades where they are opposed to those of the Germans they encountered.

The main drawback of his work, beyond a certain want of scientific construction, is the strong bias of the author in favour of that Imperial system of which he is one of the avowed and honest supporters. But it is useful just now, when it has become the habit to paint the Second Empire entirely in the darkest colours, to meet an author whose character for rectitude is undeniable, and his nurrows professional rather than pulitical, who creatly understant the second control of the con his purpose professional rather than political, who openly undertakes the defence of Napoleon III.'s system, not from any hope of future advantage in some fresh upsetting of the existing order of things in France, but from sincere gratitude to the ruler under whom he himself enjoyed consideration, and his country a long period of undeniable material prosperity. There is not the least fear for the present that the modern Ossarism now everywhere secuted will find too many defenders; and it is interesting to learn what may really be said on the side of its upholders, and in excuse of its rich and prosperous, and apparently, as a whole, contonted with it. But this strong bias of Baron Ambert's in favour of his deceased master leads naturally to his not less strong aversion to those who built up a fleeting rule of their own on the ruins of the Empire. To understand his aversion to the Government of the 4th September it is necessary to think what the sentiments would be of an old officer of our own Guards if he with Crown and Parliament upset by the rush of some overwhelming national calamity, the responsibility for which was charged on them by the mob, and found power seized, under pretence of restoring its position to the country, by a set of Radical journalists. and unscrupulous lawyers who were sharp enough to thrust them-selves into office before the lower class of demagogues could anticipate them. As to his views of the National Guards of Paris, and of the Communists who were framed out of them during the German investment by the process of natural selection which Trochu's weakness left at work, Baron Ambert was arrested and maltreated, like poor old Marshal Vaillant, by some of the horoes whose exploits in defending the capital never carried them out of sight of the wine-shops at the barriers; and he may be excused therefore if he forgets his office as historian when he has to speak of those in excuse of whom no writer at present, unless indeed we recken General Cluseret, has anything to utter worth repeating. With these exceptions against the Baron's impartiality of judgment, we have little to say but what is favourable of his work; and to those who cannot afford to gather a library on the war, himsy aspecially be commended as giving a conventions and regulable especially be commended as giving a compendious and readable account of those very parts of it which were least noted at the time. Thus, for instance, the admirably conducted retreat of General Vinoy from Mezières to Paris after the disaster of Sedan is well told in a single chapter from Vinoy's own work, and is very properly characterized at the close as "one of the finest operations of the war." Baron Ambert adds to this narrative that he was himself present at the reception of Vinoy on his arrival from Mezières; for he had loyally placed his own military services, in view of the threatened danger, at the disposal of the Governor of Paris, despite his detestation of his politics. And he was much struck at the coldness of the reception which Trochu gave to the only French officer of rank who at that time had done his duty successfully in the field. Possibly the ambitious captain who had pushed himself into the presidency of the new Government had, at that early period of his power, a pressage of the day when the mob which had conferred it on him should shout for his own déchéance as loudly as they had for that of his late Imperial master, and when the honest soldier who stood before him should be named by universal onsent the successor in the command in which he had utterly

Such questions as these, with the more important events which Baron Ambert chronicles, we shall leave the reader to study in the work itself. To attempt to review it in detail would of course be to write a commentary on the whole way. We shall confine our further notice to that preliminary portion in which he discusses the responsibility of Napoleon III. for the disasters of 1870; for here, it is be possible, some fair excuse should be found to the Imperial shortcomings. Baron Ambert's second chapter is wholly devoted to this theme, and it is hardly likely that the case as he present it here in defence of his dead master will be more ably and the chapter. "Those who saw the Emperor," the chapter

Histoire de la guerra de 1870-72. Par le général Basse de Parie: Pica.

begins, "at the moment of the declaration of war will never forget what affliction seized him in presence of the ardent demonstrations which preceded his departure for the army." As Napoleon thus evidently foresaw coming disaster, the question arises all the more forcibly, why had he done so little to ward it off? We fear that few readers will find the answer given at all satisfactory who do not share Baron Ambert's admiration for the Imperial Constitution of 1852, which, he assures us, "suited the temperament of France, as it contained sufficient liberty and maintained the principle of authority;" an opinion the first part of which events hardly justify, since they forced on that attempt to crown the edifice which appears in the author's view to be the one single mistake in Napoleon's life. From the time of thus departing from the path of order, by relaxing the authority of its chief, the true Empire ceased to be. Obscure pamphleteers attacked authority; public meetings became saturnalia; and the Emperor would have at last become weary of a part which was unworthy his name and his heart. But the evil had aready committed serious ravages, more obvious, it is said, to the true Imperialists than to the Emperor. And this was the state of affairs when war was declared, and the national awaking which Napoleon hoped for did not take place begins, "at the moment of the declaration of war will never forget national awaking which Napoleon hoped for did not take place because "revolutionary intrigues had weakened the public conscience."
We fear, by the way, that such a defence as this for his hurrying into war will not gratify those friends of the Emperor who had pitted him as one forced into it by others, though they blamed his want of foresight as to its military conditions.

Nor is Baron Ambert more happy when he goes on to apologize for the Emperor. He shows indeed clearly enough that Sadowa had the natural effect of setting Napoleon to think seriously of the coming struggle. His conclusions were that it would be necessary, in order to preserve to France her rank in Europe, to give her muster-rolls a larger number of soldiers, and her army a better organization. Commissions were appointed, and proposals framed; but his will "was shattered against the unforeseen obstacles he but his will "was shattered against the unforeseen obstacles ne encountered, and what he did obtain corresponded in no degree to the military and political necessities of France." His Ministers themselves opposed the plan of reorganization; and so the Emperor "saw his hopes of regeneration fall to the ground." As a sort of compromise the Garde Nationale Mobile was created; but the means needed for its organization were withheld as being too expensive, and it consequently received no training at all. When the pensive, and it consequently received no training at all. When the war broke out those enrolled on its lists might indeed have been war broke out those enrolled on its lists might indeed have been of some use if transferred into the regular army; but there was probably a just fear of their want of discipline, and as this measure was not attempted, "the army had gained nothing by the efforts of the Emperor." Just the same sort of story is repeated as to other needs. The Emperor saw the defects of the French field-gun; his "Artillery Committee would not for an instant admit that there could be a cannon in Europe superior to it." The Emperor are received the receiver of studying beforehead, the statement that there could be a cannon in Europe superior to it." The Emperor perceived the necessity of studying beforehand the strategy of the coming war; but his projects "were based on alliances which seemed assured"—but were not. The Emperor took care that there was plenty of material; but it did not prove readily available at the crisis, because "the system of detachments and dissemination had created difficulties in the way of prompt mobilization." In this matter indeed, as the author justly puts it, Prussia had learned to combine two things formerly distinct—preparation and formation. France was surprised in the campaign

preparation and formation. France was surprised in the campaign bacause, although her forces were prepared, they were not formed.

We need not follow the worthy Baron through the rest of his elaborate defence of the sovereign to whose memory he is devoted. At the best it is but the merest palliation of that dreamy weakness of the Third Napoleon on which we very recently commented in revisiting his own Posthumous Papers. The truthfulness of this revisiving his our Posthumous Papers. The truthfulness of this exculpatory chapter is fully confirmed by its unconscious similarity to the Emperor's own apology for his mistakes. But the value of the narrative that follows will excuse to most students of the history of the war the needless prolixity of this introduction, which only gives fresh proofs that the Imperial machinery which had been revived by the Napoleon of our day in imitation of his greater predecessor's statecraft had got entirely beyond his powers of management at the very time when the rash plobiscite of 1870 country his right to project to confirm his right to project in

seemed to confirm his right to maintain it.

SKETCHES OF ETON.

TIHIS good-looking volume contains fourteen etchings of Eton and its neighbourhood, with about the same number of minor sketches printed along with the text; and the text itself consists of fifty-eight pages of letterpress. Mr. Chattock is already known as a skilful landscape-artist, who, like many other painters in the present day, has given a part of his time to etching. There is always, or nearly always, a time of probation during which an artist, however skilful he may be in one art, attempts the acquisition of another; the water-colour-painter who tries his hand in oil, the oil-painter who makes experiments in freeco, has to struggle with difficulties which are often quite as much created by the work that the artist has done previously as inherent in that which he is endeavouring to do now. He will be especially liable to failure from the old habit of struggling with something which it would be better to forget, or to consider of secondary importance. It is each that one great reason why carriags-horses are not good

Bletcher of Eton. Etchings and Vignettes by Richard S. Chattock, and Descriptive Notes by W. Wightman Wood, of the Lines Temple, an expense of the Chatton. London: Sealey & Co.

for the saddle is because they cannot forget the es upon it in imagination, and so, being no longer sustained by it, are liable to stumble and fall. Just so the painter who first begins to etch is liable to fall from a reliance upon certain qualities of sipainting that cannot be got in etching without qualities of sipainting that cannot be got in etching without qualities of sipainting that cannot be got in etching without great labour and the charm of that stabed work which is perfect in its own paraller. the charm of that etched work which is perfect in its own peculiar kind. Mr. Chattock deserves the praise of having wisely avoided this danger. His etchings are genuine etchings, and the deserts which a severe criticism might point out in some of them are never defects of method.

It is curious that the authors of this work should have thought of them, what the art of etching consists in; but perhaps for the general reader such an explanation can hardly as yet be considered altogether superfluous. They very properly correct the error common amongst amateurs by which pen-drawings are called etchings:-

And first let us notice, in order to dissipate it, an impression which is sometimes found to prevail that "stching" is the same thing as drawing with pen and ink. One frequently hearp of "stchings" being done by amateurs which turn out on inspection to be simply drawings, more or less elaborate, executed with a fine-pointed pen upon paper. But whatever this it may be allowable to apply to such a drawing, it is clearly incorrect to style it an "stching," for the art of stching (so-called from the German cases, to cat) consists essentially in the crosion of lines upon a metal or other surface by means of uquafortis.

The writer goes on to explain how the plate is protected where the acid is not intended to act, and also what Dry Point is. Most of our readers who care about the fine arts will already be familiar of our readers who care about the fine arts will already be familiar with the process, at least in theory; for, though somewhat modified in points of detail by modern practitioners, the principles of it are exactly what they have been for centuries. We pass on therefore at once to a technical subject of more novel interest, Mr. Alfred Dawson's process, called "Typographic Etching," which has been employed for all the minor illustrations in this volume. Mr. Dawson (who is a son of the well-known in this volume. The process of the process of the son of the well-known in this volume. tried once more what has been tried already by so many inventors tried once more what has been tried already by so many inventors—namely, to discover a process by which a draughtsman's own line might be printed, as woodcuts are printed, along with letterpress. Any one who was partially acquainted with recent art history, but not accurately critical, would say at once that this desideratum had been found several years ago. There have been a dozen "substitutes for wood-engraving," such as Mr. Palmer's glyphography, M. Bellay's process, M. Comte's process, the graphotype, dallastype, &c., all of them ingenious, but all imperfect in one way or another, either because the lines were thinner or thicker than the lines the artist drew, or else because they were often broken and disconnected. Mr. Dawson's process they were often broken and disconnected. Mr. Dawson's process appears to be quite sound, and artists who have tried it inform us that the lines are neither thinner nor thicker than they ought to be. If on further trial it is found to be satisfactory in these respects, it will be a decided acquisition to the fine arts, and Mr. Alfred Dawson will have a claim upon our gratitude. Processes of this kind will never supplant wood engraving, but they may be of great use for cheap and rapid illustration in which the artist wishes to communicate directly with his mublic

wishes to communicate directly with his public.

The subjects of Mr. Chattock's etchings are of the kind which attach themselves to our memory of any well-known place. They could not have been more happily chosen, for they combine two kinds of interest which it is not always easy to reconcile—the interest that would engage the attention of an old Etonian with that which would attract an artist, or anybody taking pleasure in art for its own sake. Illustrations of locality usually fall into one of two pitfalls which await the unwary designer. Either he preserves local fidelity at the cost of art and so wastless accurations. of two pitfalls which await the unwary designer. Either he preserves local fidelity at the cost of art, and so produces something which may suit people who know the place but cannot have the least value for others, or else he is so very artistic and imaginative that no one can recognize the places that he represents. It is partly, perhaps, a consequence of Mr. Chattock's good luck in choosing such a locality as Eton that there appears to have been no incompatibility between artistic purposes and a great degree of topographic truth. The place is admirably suited for artistic illustration. The old College itself is worthy to be drawn because of its aspects; and there are in the immediate neighbourhood a fine river, a magnificent castle in a noble situation, and an illustration. The old College itself is worthy to be drawn in several of its aspects; and there are in the immediate neighbourhood a fine river, a magnificent castle in a noble situation, and an abundance of beautiful trees. Windsor belongs to Eten from the artist had an excellent excuse for paying attention to the river in the aquatic instincts of Etonians. Altogether the scenes at and about Eton are so well worth aketching that an etcher of tasts and ability could hardly go wrong in his netections, and would never feel compelled to abandon the aims of an artist energy which serves as a frontispiece, we find ourselves quite chose to the rather rough and very substantial old building, and we have abit of that flat-topped wall on which there has been such a woulderful amount of trading in fruit, sweets, cysters, bats, build, flowers, birds, dormice, and other unnecessaries. "The Callege from the River" gives a fine imposing view of the edities are which, which its turners and battlements confusedly reflected in the walls. This plate scenes to up very cloverly managed throughout, and its artistic expression of height variety and restlements to the spectator. In "Romans health the artistic conveyed to the spectator. In "Romans health that in this case the walls might allowship have lifted the Castle higher in

the air, since this view (though no doubt correct enough as a literal representation) fails to convey the idea that the Castle has a grantily also atta. In the "Sixth Form Beach" we have a rather limited but undeniably fine bit of "intimate" English landscape, two or three very fine and lofty trees, and efforground of dark water with some palings and a house just indicated beyond it. Mr. Chattock has made the most of this material, treating it in the genuine spirit of an etcher, and the plate is one of the most satisfactory in the volume. The "Chapel Seaps" sadly want a few figures to enliven them; there the plate is one of the most satisfactory in the volume.

"Chapel Steps" sadly want a few figures to enliven them; there is far too much dead wall here, which would have done well as a background to something more interesting, but is very insufficient in itself; happily the gas-lamp, the window, the stair-wall, and a bit of crocketting on a buttrees save the plate from absolute vacuity. The "Chapel from the Clump" is a good subject well managed, but it is rather a pity that the building leans so much. Hardly any artist draws a vertical line naturally, but he ought always to find out by experiment which way his lines have a tendency to lean, and then correct the tendency. The tree trunks are very good in this plate; indeed we may observe that Mr. Chattock is strong in trunks, which he appears to have studied with especial care, but he is not so strong in foliage, which is generally touched rather. he is not so strong in foliage, which is generally touched rather heavily. That in "Sheep's Bridge" expresses mass very effectively, and in the "Upper Club" the masses are well rounded, yet for some reason there seems to be a deficiency of the quality which we will venture to call leafiness. "The Brocas" is an evening seem on the views under a postingle offset with a more algebrate, sky, than My river under a poetical effect, with a more elaborate sky than Mr. Chattock usually attempts. "Boveney Lock" is the pretiest plate in the volume, full of freshness, and air, and light, with a sky so happily treated that it is quite a model for etchers, and a grand central mass of trees perfectly successful in their light and " Surly Hall" seems rather unfortunate in being so much blacked up; an issue of some kind would have been desirable. In "The Thames at Oakley" it is a pity that Mr. Chattock has introduced a sail near the left-hand corner, which makes a triangular patch of crude white cutting against the trees disagreeably, and the trees themselves are very heavy and black. The plate called "Monkey Island" is much more harmonious; indeed, so far as harmony is concerned, it is one of the best in the volume, but still there is some heavings in the treatment of the deeply-bitten poplars. "Maidan beat is a presented with year vigorous realism and it a head Bridge is presented with very vigorous realism, and is a successful study, but not a composition. We have purposely given the titles of all the plates, that our readers who know Eton given the titles of all the plattes, that our readers who know Eton may see what Mr. Chattock has done for the College and the river; but we have not given the subjects of the typographic etchings in the text, which illustrate such things as "Windsor Bridge," the "Clock Tower," "Upper School Stairs," "Lower School Passage," the "College Pump," and so on; in a word, all sorts of interesting bits that would not have afforded subjects important enough for the more serious etchings out of the text. The two sets together de the great wavely may be a subject.

do the work vary thoroughly.

The text by Mr. Wightman Wood is a lively and straightforward account of the customs and history of the place, written with full knowledge as well as experience and affection. It is

wonderful how the school increases:

From 1812 to 1852 the school fluctuated considerably; during that period the minimum, including collegers, was 444 in 1836, and the maximum was 777 in 1846. In 1853 the sum total was 600, and since then there has been a continuous increase. Ten years ago the school numbered 830, and now it contains 930, and "the cry is still "they come." If the time the higher the place will be destroyed, and yet it is a difficult metter for the authorities to stam it, especially as the increase is not disproportionate to that of the wealth and population of the country.

Mr. Wood gives rather a favourable account of one great instrument of culture, the birch:—

Mr. Wood gives rather a favourable account of one great instrument of culture, the birch:—

We have said, that the Head-Master's room is commonly called the Byshking Room? and no visitor will fail to observe the "block" upon which the executions take place—not but that the two steps of which it consists form a very harmless-looking piece of furniture. Flogging with a birch has from time immensorial been the regular constitutional punishment at Rica; it is administured by the Head-Master only, and no other kind of corporal punishment is permitted; the corrective power of the Assistant-Masters being limited to imposing tasks of extra work (too frequently of a melies instead of an improving character) and to maining offenders present themselves at unusual hours. If an Assistant wants to go beyond this, he must send the bey to the Head-Master. The consequence is that there is messessily much show flogging than at those schools where the Assistant-Masters have the right of caning; and it is far better that it should be so, as the Ricar system ensures deliberation and uniformity, in both of which the other is defective. There are many, no doubt, to whom the mere mention of this subject is like a red cloth to a buil, but we veature to assert that if corporal punishment is not an absolute meacessity in a great public achool, at any rate it is the mode of punishment least open to objection. If a boy has to write out lines, he is compelled to waste time which he might be spending poolitably, besides ruining his handwriting, and acquiring disgust for the entjets-master of his punishment; and, on the other hand, it is impossible to give him extra profitable work without unsuly working the Master, who, heating him up, or breaking up his play-time, keeps him them healthy examenes, and is isjurious to his physical development. But a moderate flogging has none of them disadvantages; it is found to be very determine these who arrestly regards the birch with respect, in which medit upon it would be the most unprofitable supercre

fir. Wood evidently regards the binch with respect, in which subset there is even a slight minters of effection; such is the materially sweetening power of the far-past resistingment of youth; philipping as may be the senciations of the "Swishing Room,"

those of the Playing Fields are likely to be still more delightful. Mr. Wood writes of this Elysium in the glowing language that we should expect from an old Etonian:—

We should expect from an old Extension:—

Premising the possibility that our tasts is warped by an excessive sensitive in favour of our Alma Mater, weekeg to record our unfattering comment in favour of our Alma Mater, weekeg to record our unfattering comment in favour of our Alma Mater, weekeg to record our unfattering conviction that there is not on earth a place and ignition as the Exos. Flaying-Fields." The spot so called is, in truth, a perfect little "park," with water, timber, and greensward charmingly blended. The silventy Thomas, as yet triumphant over his ensumes the sewers, glides rapidly along the front, while the enclosed space is bleated by a humble but friendly triinstary during the last reach of its independent existence. The trace are for the most part clus of the largest size, many of which, we griseve to say, having existed beyond the usual three hundred years of elm-life, are no longer able to withstand the altacks of wintry gales, and are becoming more and more dismembered in each succeeding year. The grass throughout is sheep-the, and large plots dedicated to cruket are kept as trim and even as large.

As Me Wood lower Eton as yours and amuseoistes its largests.

As Mr. Wood loves Eton so much, and appreciates its beauty so completely, it is unnecessary to observe that he regards the long low visduct of the Great Western Railway with anything but favour :-

Formerly the view all round from the Brocas was extremely plotureaque, specially of St. Leonard's hill across the river, but it is now entirely specific by the Great Western Railway, which, in order to keep out of the floods that visit the Thames valley in winter, comes into Windsor for two miles upon arches. He must be a Philistine indeed who can look with patience on this hidsons screen of brick and mortar; nevertheless, as far as the "Great Western" is concerned, it is doubtless a necessity, and as regards the Etom anthorities, it is a just retribution for their constant opposition to all the former schemes of the railway company. When the main line of the Great Western was planned, though railways had then bean in existence ten years, ktom College, like Oxford University and other good old Tories, was horrited at the idea of so revolutionary a change in the conditions of focumotion, and joined with the Crown tooth and nail in driving the main line away from Windsies, through which place it would have been taken but for these adverse infinithe idea of so revolutionary a change in section the crown tooth and nail in driving the main line away from Wandson, through which place it would have been taken but for these adverse inflacences. They were not oven satisfied with the proposal that the line should come no nearer than Slough; and Serjeant Manuscher, in opposing the Bill of x825 before the Committee of the Lords, used language of which the following is a specimen:—He said that if the railway were made "the following is a specimen:—He said that if the railway were made "the following is a specimen:—He said that if the railway were made "the following is a specimen:—He said that if the railway even made "the College, it would be choked up for want of traffic, the drainage of the country destroyed, and Windson Castle left unsupplied with water. As for litter College, it would be absolutely and entirely rained; London would pear forth the most abandoned of its inhabitants to come down by the railway and realints the minds of the scholars, whilst the beys themselves would norm the most abandoned of its inhabitants to come down by the railway and pollute the minds of the scholars, whilst the beys themselves well take advantage of the short interval of their play-hours to run up to town, mix in all the dissipation of London life, and return before their absence could be discovered."

THE COSTER LEGEND.

THIS treatise, written by a Dutchman, and placed within the reach of English readers by the translation of Mr. Hemels, has for its object to expose the Coster Legend, or, as the author prefers to call it, the Coster Villany, by which his countrymen have so long suffered thomselves to be duped. The way in which this object has been carried out is best explained by Dr. Van der Linde himself in the preface:-

Linde himself in the preface:—

If I had written for any other public but that of Holland, much of what I have said about futenberg could have been omitted, that being better known elsowhere; but the bad faith of the Costerlans has obscured and distorted all this for the Netherland public. It ought to be enabled to compare history and fuble. The so-called arguments for Hasrlan, placed by the side of the historical documents for Mentz, would be already a condemnation of the Costerian misleading demagogues. All documents are here together for the first time. Whoever has no leisure to make a study of the subject, let him read the book without the notes; by a simple reading he will be convinced that the Haarlem statues are crumbled down before criticism, like Dagon before the ark of the coverant. Let us watch how long the Haarlem prople will remain deaf to the truth!

If there is any truth in the old saying about the incurable deafness of people who do not wish to hear, we should think that Dr. Van der Linde will have to watch a very long time. There is no task more hopeless than the attempt to overthrow a popular legend. People fancy that what they and their fathers and grandfathers have heard and believed from their cradles must be true, whatever reasoning may be used against it. And as in this case the legend is supported by such tangible evidence as wine-pots made from Coster's type, books printed at Coster's press, a house in which Coster lived, a pedigree of Coster's descendants, and a statue of Coster himself lately set up in the market-place at Haarlem, Dr. Van der Linde will, we should fear, find it doubly hard to prove that this legend is after all a mere myth. There is no part of a Dutch-man's creed to which he clings so closely as to his belief in the wonderful invention of his countryman Lourens Coster. Even in our own country popular feeling favours the claim of Coster. whole story is just one of those pretty, sentimental, improbable tales which people like to receive as true. A worthy old Dutchman whole story is just one of those piecy, as true. A worthy old Intehman who, while walking in a wood, shapes letters out of beech bark for the good of his grandchildren, who finds out by accidentally treading on them that he can take off impressions of them on paper, and then follows up this discovery till it ends in a printing press, is a very lovable character. The virtue of this excellent old man shines out still more brightly from the contrast of the exceeding wickedness of the villain of the piece, the deceitful assistant who worms himof the villain of the piece, the deceifful assistant who worms numself into the old man's confidence only to rob him of the fruit of his invention—his wonderful types. Even the time of the theft adds interest to the tale. Who but a very accomplished villain would have chosen Christmas-Eve and the hour when his pious manufactures at church to carry out his evil plan? Then, mastir was at church to carry out his evil plan? Then,

The Macrican Layend of the Inscettin of Printing. By matter Chaire. Orthogry Stramined by Dr. A. Van der Linde, until by J. H. Hanels. London : Blades, Eest, & Hieden. 1871. By Louis mouth to mouth by a string of old and respectable men, who shed tears over the inventor's wrongs, and point to the wine-pots made from the very types which they somewhat illogically declared to have been stolen, helps to lend to the story just that spice of the marvellous and sentimental which was needed to win a popular verdict in its favour. Few of those who hear it have the time or the patience to sift the evidence on which it rests. Most people have some faith in the truth of the proverb which says that there must be water where the ox was drowned, and hold to it that no such story is got up without at least some shadow of truth.

For the benefit of those who have neither time nor inclination to go into the subject for themselves, Dr. Van der Linde has now brought together for the first time all the documents that throw light upon it. He traces the story back to the tiny germ from which it first sprang. This was the testimony of Coornhert, who, in 1561, on the evidence of "very old, dignified, and grey heads," ascribes the honour of the first invention of the art of printing to Haarlem and not to Mainz. From these ancient worthies he had heard, it would seem, the name and family history of the inventor, but he does not reveal them. It was left for Hadrianus Junius, some twenty years later, to prove that this first inventor was none other than Lourens Janszoon, called the Coster, or Sacristan, from the office which was hereditary in his family. As for the testimony of Guicciardini, on which the Dutch have hitherto laid great stress as coming from a foreigner who could not be prejudiced in their favour, it does not amount to much. It is true that he tells us that the people of Haarlem in his day believed that printing had been first discovered in their city, and had writings and other memorials to prove it. Of the truth of their pretensions he says he does not wish to judge. But as these same citizens of Haarlem told him at the same time another story of a tame merman that had been caught in the Frisian Sea, and had lived many years at Haarlem, and as he in all good faith and simplicity relates this story, it is clear that either Guicciardini or the men of Haarlem from time to time allowed their love of the marvellous to get the better of their love of truth.

To Hadrianus Junius, then, we must, it would seem, give the whole credit of coining a fiction so flattering to the national vanity that it was received at once without questioning as a part of the national history. He gives to the inventor not only a local habitation and a name, but also a date; for he tells us that some one hundred and twenty-eight years before he wrote his "Batavia," Lourens Janzzoon the Coster lived at Haarlem in a respectable house, still to be seen in the market-place. As the "Batavia," did not appear till some time after the death of the author, the date at which the part of it where he treats of Coster's invention was written, and therefore the date of the invention itself, is somewhat doubtful. The destruction of the Haarlem wood in 1426 made it needful to fix some year earlier than that date for the walk in the wood which led to such wonderful results; and therefore the Dutch have agreed to accept 1423 as the time of this first discovery, though the alleged theft of the type did not take place till 1440. Dr. Van der Linde points out how, to make the chronology of these several events fit in to one another, a great deal of juggling has been needed. This is most evident in the pedigree of Gerrit Thomasz, who gave himself out as the grandson of the inventor, and of whom Junius could been possessor of a tavern of good repute in the market-place. In this tavern were still to be seen the noted wine-pots.

this tavern were still to be seen the noted wine-pots.

A copy of this pedigree is given to the public by Dr. Van der Linde. The original is preserved among the other relics in the Museum at Haarlem as a very great treasure. In it is traced the descent of Gerrit Thomasz from Lucy Coster, the daughter of the supposed inventor. This Lucy, it would seem, became the second wife of Thomasz Pieterssoen, and is thus described in the ancient document:—

Zyn tweede wyff was Louris Janssoens Cos--ters dochter die deerste print in die werlt br--ocht Anno 1446.

After pointing out that the date here has been tampered with, the 6 having been turned into an o to make it tally with the 1440 of Junius, and after explaining the very suspicious nature of the word print, at that time only applied to a woodcut, or drawing, Dr. Van der Linde further adds:—

Dr. Van der Linde lurther auus:—
We see here a fable arise before our very eyes. A Haarlem citizen has a pedigree made for him, probably to put it up in his ian; at least he occupies the house in the Market-place, which seems to have always been an inn. But the frame wants lustre, and so the pedigree is linked by the probably totally fictitious Lucye (the second wife, "tweeds wyff") to a Haarlemer; to a Haarlemer who (she awkwardness and naïveté of the expression may not surprise us at all in such a product of family vanity) "deerste print in die werit brocht." Such fabricators of pedigrees exist in multitude to this very day.

With a real and patience worthy of a better cause and of a better reward, this painstaking inquirer has made diligent search in the archives of Haarlem in hopes of finding something more certain about this mysterious author of "deerste print," who according to some authorities was an imherent, according to others a sheriff, and according to his generally according to these a sheriff, and according to his generally according to name a sacristan. By these researches one Louwerije Jansszoen, and one only, has been brought to light as living at Haarlem in the afternation than Jansszoen in the account-book of the church the Haarlem, Dr. Van der Linde decides that he must have been a

tallow-chandler in the town somewhere between the years 1441 and 1451. After this date he set up an inn, and finally in 1453 he must have left Haarlem, as the sum of eight guilders is entered in the treasury accounts as paid by him in that year for "ferry toll"—that is, duty of departure on his goods when he left the town. The descendants of this same Louwerijs or Lourens are easily traced, for at Haarlem there still exists a "heiling Karstgilde," or Holy Christmas Guild, set up in order that its mambers might lend each other mutual aid in the lofty aim of over-eating and over-drinking themselves at that holy season. To this jovial body Louwerijs belonged, and as the stalls of its members are hereditary, the names of his descendants are found in the entries of the chair register of the guild. In this register "deerste print" is not brought forward either linked with the name of Lourijs Coster himself or with that of his grandson, Gerrit Thomasz. It seems then more than likely that its insertion in the pedigree was a politic fiction of the innkeeper intended to increase his custum. No doubt it acted much as a striking advertissment might act in the present day, and lured the wily Gerrit's fellow-citizens into draining more than their wonted number of draughts as deep as the traditional Dutchman's draught should be, to the memory of their host's illustrious grandfather. If we inquire further into the nature of the respectable old men who made such an impression on Junius, we find that the aged Cornelis, who represented himself as a fellow-worker of the thief who stole the types, and who wasted so many tears over his fellow-workman's villany, could not have been more than ten years old at the time of the theft. As for the other old man, Junius's tutor, Galius, according to the calculation of Mr. Chatto he could not have been more than thirty-six when he repeated the story which he had heard from the lips of Cornelis to his hopeful pupil. At that age, as Mr. Ohatto observes, it is not usual for persons to have grey

Though we cannot but admire the thoroughness with which Dr. Van der Linde has sifted and exposed the shadowy grounds on which has been built up the claim of Haarlem to the glory of the greatest invention of modern times, we cannot agree with his interpretation of the mysterious words "getté en molle" of the Cambray MS. This "getté en molle" of Abbot Robert seems to us utterly meaningless as applied to any other than cast type, and can by no stretch of imagination be made descriptive of block books. Nor do we think that this stout advocate of the claims of Mainz has succeeded in robbing his country of its claim to the credit of first excelling in xylography at all events. This claim rests on the famous passage from the Cologne Chronicle of 1449, which runs thus:—" Wiewail die kunst ist vonden tzo Mentz, als vurez vp die wyse, als dan nu gemeynlich gebruicht wirt, so is doch die eyrste vurbyldung vonden in Hollant vyss den Donaten, die dae selfist vur der tzyt gedruckt syn." That is, although the art was found out at Mainz in the manner now commonly used, yet the first forecast was found in Holland in the Donatuses printed there before that time.

there before that time.

The writer of this first account of the rise and progress of the art of printing quotes Ulrich Zell as his authority, and states very plainly that, though actual typography was first perfected in Mainz, yet the forecast of the invention was known before in Milland. Dr. Van der Linde sweeps this testimony away by explaining that the Cologne chronicler was weak in his geography, and that he used Holland as a term for all the Netherlands, and that in this case he must have meant Flanders or some of the North-German States. If this be granted the whole passage loses its value. It might just as well be said that the writer meant some other town when he wrote Mainz. In his chapter on the several editions of the Speculum Dr. Van der Linde pulls down ruthlessly all the theories that bibliographers have built up as to their great age. This theory has hitherto had the seemingly unanswerable evidence of the paper marks as its foundation. This foundation is here shown to be very shifting sand, as the same paper marks are found in books printed in the latter part of the infleenth century at Mainz, Cologne, Nürnberg, and Strasburg, On examination of these marks and of the type Dr. Van der Linde is of opinion

that the pure North-Notherland, common Low-German sharacter of the xylography of the Speculum, places the book ideforically in the second half of the xill century, and—in combine with the whole current of the Notherland-German development of wood-engagening, with the positive dates

of all the discovered typegraphic and mylagraphic illustrated works (mostly from a 1740 till the rith emitury) for in the third quanter of that century, and so as all 1750. I may edd to this that Holtrop, the best judge of Netherland incumabals, during a long discussion on the Specula, made the following confusion to me: "When you sak me on my conscience, I must say: these books are not so old."

After having pessed in review and denounced all the other treasures of the "municipal show-booth," Dr. Van der Linde concludes with the following extortation to his countrymen, which is a fair sample of the strong language in which his feelings find vent when dealing with those who are opposed to him:—

Indeed, the Coster-question is "national." And that it is so, is a sad

aign.

Notimal! One of those miserable words which corrupt the minds of the people! Anthropophagy, lepra, impurity, laxineas, thievishness, all these may be national, if we only know of what "nation," Battaka, Icelanders, Arabs, Laxinaroni, or Caffres, we speak. National by itself means nothing; the question is whether we mean national vices or virtues. Our "moderation" (suphemism for lukewarmness and apathy) is very national, but on that account no less detestable. And our national gin is a national plague. On the other hand—for our national perseverance (although it is too slow), spirit of independence (although it is somewhat prevential), language (although it is too meagre for song), for our national vegetables and cows—all respect! But not, for instance.

Not, for instance, for our national Canada and cows—all respect!

instance
Not, for instance, for our national Coster, for "our" Coster. He exprour ridiculous self-adoration, and it is a national interest to destroy him.

BALTET'S ART OF GRAFTING.

OF all the arts connected with horticulture none is superior to that of grafting, either in the interest of the operation or the importance of its results. So marked and various are the latter that can afford to part with the fiction and romance which ancient writers have woven round this art, and to rely on ascertained facts to prove that, in partnership with nature, it achieves triumphs de-nied to nature working alone, and performs miracles of transformation, development, reproduction, union, and multiplication. But in the cultivation as well as in the intelligent exposition of this art British horticulture has to look up to the successful ex-periments of our Gallic neighbours, and to learn from them many niceties of manipulation and system which are alien to our rougher and readier treatment. It may be, indeed, that our rougher and readier treatment. It may be, indeed, that of the forty-three various modes of grafting which M. Thouin enumerates in his Monographic des greffes, a good many might fairly be deemed rather curious than useful. Nevertheless the refairly be deemed rather curious than useful. Nevertheless the residuum, after eliminating these, would contain improvements upon our more rudimentary modes in each division of the methods of grafting. Hence the especial usefulness of the handy treatise just put forth from the Garden Office, and translated from the French of the most successful Continental professor of the grafting art. Systematically arranged, intelligently illustrated, almost exhaustively handled, the whole topic is laid open to the systematic or professional as well as simplified for the use of the amateur or professional, as well as simplified for the use of the tiro in the pages before us. It is only to be regretted that a reviewer, who cannot reproduce the drawings and diagrams with the letters that denote points of section or details of operation, finds a difficulty in doing this very useful manual the justice it

"Grafting" is defined to be the union of one plant with another for support and nutriment, passed through the roots and stem of that other to the grafted plant. This latter is the scion, which must have at least one shoot or eye, whilst that on which it is engrafted is the stock. The objects of such a union, which does not interfere with the character or constitution of either of the parties concerned, are to modify the wood, foliage, or fruit which results from it, to develop these in parts of a tree where they are defective, to reinvigorate an exhausted tree by fresh sap, to bring the two excess of monoscious plants into union, for reproduction, on one stem; or, lastly, to multiply woody or herbaceous plants for use or ornament with a rapidity and a success not uniformly

accorded to propagation by cuttings :-

eccorded to propagation by cuttings:—

Without grafting [writes M. Baltet] our orchards would not contain such rich collections of fruits for all seasons; our forests would be without a large number of important kinds of trees; and we should not experience the pleasure of seeing in our parks such a brilliant array of native and exotic abrubs. There remains one observation more to be made in favour of grafting—namely, that the plant, or fragment of plant, grafted on another preserves its original qualities and characteristic properties. It will produce branches close or spreading, leaves purple or silvery, flowers white or rose-coloured, fruit large or small, early or late, exactly resembling the variety from which it was taken, and without being influenced by the neighbourhood of, or contact with, several similar kinds grouped on the same stock.

To ensure success, however, there must be both manipulative skill in the operator and an observance of certain essential conditions. One of these is that there must be affinity between the species. Experiments in grafting must be confined to the same botanic family, at all events within the same natural order. Peach or agricet may be grafted on each other, or on their bardier congeners, the almond or the plum; the mediar and quince will flourish on the bawthorn, though the blossoms of the tree which furnishes the stock are dissimilar from those of the scion. Chinese tender roses will graft on our wild hedge-rose, and there is no end to the vagaries which may be wrought by grafting fruking branches of pear, mediar, servise, mountain-ash, as well as double and red thorns, cotonesster, and pyracantha, on the same

thorn stock. Akin to this law is the teaching of observation in reference to propagating varieties of the pine by grafting. The stocks must be analogous to the grafts or axions. Pines with five leaves units best with the Pinus excelse and the Norwegian pine; those with two or three leaves do best with P. Sylvestris, Austriaca, and Laricle (though these in general suit the greatest number of varieties); and Pinus Pyrenaica, in the South of France, makes a good stock for some forms of the two-leaved group (see p. 195). On the other hand, you cannot graft a sweet chestnut on the alien horse-chestnut any more than vines on walnuts or roses on black currents. Other essentials are analogous vigour, though, if there be a difference, the graft should be of later vegetation, as well as greater vigour and hardihood, than the stock. This is shown by the results of grafting the pear on the quince, the apple on the paradise stock, and the cherry on the Mahaleb. And while it is of importance that the stock should not be so weakly as to communicate its tenderness to the graft, it is of prime consequence thorn stock. Akin to this law is the teaching of ob ance that the stock should not be so weakly as to communicate its tenderness to the graft, it is of prime consequence to see that the latter be pure-sourced and hardy. "The degeneration, more apparent than real, of species and varieties is especially due to the selection of bad subjects for propagation." Intimate union, also, between the two parts is a size gust sus, and this not through the epidermis or pith, but the "alburnum," or new wood, between the inner bark and the heart-wood, which represents the new and living extension of the medullary rays. Another rule is to graft while the sap is in motion, and in the same condition in scion and stock; either at the flow in spring or the ebb in autumn. The aim should be to choose a warmish atmosphere that will not chill the nutritious fluid, and though in some cases open-air grafting may extend to November, all winter

mosphere that will not chill the nutritious fluid, and though in some cases open-air grafting may extend to November, all winter grafting belongs to the propagating house or the cloche. That grafts made at the new moon possess special vigour is an old-world fable, which we scarcely need M. Baltet's authority to relegate to the limbo of delusions about grafting.

As concerns skill in the operator, the pages devoted to his tools show the advantage of our French neighbours over ourselves in instruments of precision. There is much to be learnt from their budding-knife with its ivory spatula to raise the bark without risk of rust, in the "combined grafter" (p. 14), and the métro-graffe, which is the grafter's pair of compasses, with which he measures the back of the bevel of the graft, and then traces on the stock the same sized groove for its reception. And when we come to the essentials of ligatures and grafting clay, it becomes a marvel how any gardener, professional or other, can be content to deal with grafting clay, a nasty and literally "mucky" compound, when he can procure at Covent Garden Market a cleanly French substitute, a cold mastic manufactured by M. L'homme Lefort of Paris, and sold in tin boxes in which it preserves its pliability of Paris, and sold in tin boxes in which it preserves its pliability even after the box is opened. The merits of this preparation consist in its being always ready for use, as easy to spread about a graft as butter on bread, and more certain of keeping in position when so spread than the old and objectionable materials. cheapest ligatures, which serve the purpose of cotton and wool at a less cost, and with some advantages over them, are cut lengths of the leaf of the reed-mace and the bur-weed, two members of

of the test of the recentification the bur-weed, two members of the natural family of Typhacom.

Of the methods of grafting, that "by approach" is the most ancient, primitive, and natural. It consists in uniting two trees by their stems or branches, the leaves of the scion not being removed as in other modes, because it remains attached to the parent plant while being joined to the stock, an exactly corresponding portion of wood and bark being removed from each at the point of grafting. After the graft is a year old, it may be detached from the parent stem. This method is adopted in two fashions: (1), the ordinary mode of retaining the upper part of the scion after its juncture with the stock; (2), the mode called "inarching," where the cut top of the scion is inserted under the bark of the stock. This latter may be done with an eye or with park of the stock. Instatuer may be done with an eye or with a branch, during the sap-flow in spring or summer; its object is the restoration of defective parts of trees, and in some cases multiplication; and its differentia from ordinary grafting by approach, which is done by veneering and inlaying, lies in cutting off the top of the scion, and inoculating it under the bark of the stock. No one who has this manual to refer to will find either method a failure if he lays to heart its careful directions as to stock. No one who has this manual to refer to will find either method a failure if he lays to heart its careful directions as to treatment after such grafting, and as to the detachment in due course of the scion from the parent stem. The romance, so to speak, of this part of the subject is illustrated, verbally and by drawings (pp. 49-56) in such a way as to show the various modes of "grafting by approach" from a common parent tree, which may be elevated in a pot, and yet unite with half-a-dozen circumjacent standards. By the "approach" method you may renew a defective stem, inarching branches upon it above the diseased part, re-establishing the healthy flow of the sap which it has impeded, and eventually cutting away the cankered base. Not less neat is the way in which the restoration of a main branch in a fruit-tree trained to the form called "chandelier palmette" is effected by planting as a stock a young tree into which to graft, by approach or inarching, the defective branch. Approach-grafting is also extremely successful in the figure-training wherein French fruit-growers excel, and the resort to it in grafting the trees which compose a "single cordon" one on another by lengthening or joining short branches with an inserted supplement, is an ingenious series which reflects credit on its inventor, M. Ricaud of Heaune.

A much larger division is that of grafting with detached scions, the resort being branches, or parts of branches, with one eye at

The Art of Grafting and Budding. By Charles Baltet.

least, and from two to six inches at length. With these may be undertaken the various sectional methods of side grafting, crown grafting, grafting, "de précision," cleft grafting. English method, and mixed grafting. Of these, side-grafting is in this handbook limited to cases where the scion is insurted in the side of the stem, or on a branch of the stock, either between the bark and the alburnum, or in the latter itself, the bark in no case being removed; and this side-grafting may be either, performed with a simple branch, or a based branch, i.e., one cut from the parent with a heal or strip attached to the base. As odd and uncommon mode, which comes under the head of side-grafting, and is applicable to hael or strip attached to the base. An odd and uncommon mode, which comes under the head of side-grafting, and is applicable to gumless old stocks and bare stems, is to drill bark and alburnum, without touching the pith, with an oblique hole from above downwards, and into this, properly smoothed, to fit the rounded and pointed end of the graft. Perhaps there is a greater attraction in crown grafting, which is suitable to a large number of trees and shrubs, and is an operation practised in spring. It is indispensable in the case of large trees, of which a number of scions may sable in the case of large trees, of which a number of scions may be grafted so as to enjoy the ample nourishment of their roots. The principle of this mode is to insert the thin, pointed end of the seion between the bark and wood of the stock in an opening made by a small implement of wood or ivory. The thicker the stock, which must have been headed down a month before grafting, the more scieds it will find room for; only a distance of two inches should be left between each. A bandage is necessary after the insertion of the scions, and the application of grafting-wax to the cuts and covering-bark will provide against the danger of rents. An improved mode of crown grafting owes its invention to Professor du Breutl, who has written much upon this and kindred subjects. Broul, who has written much upon this and kindred subjects. Its merits are the multiplication of points of contact in order to accelerate the cohesion of the graft, and the sloping direction in which the stock is cut to prevent the cozing sap from obstructing such cohesion. This has been found very successful in the department of Isère, where the walnut is very largely grafted. We must pass by the interesting sections on grafting "do précision" to give a hare glauce at cleft grafting, which is performed by splitting the stock (which is first cut obliquely, and then smoothed horizontally across the top) diametrically, and afterto give a bare glauce at cleft grafting, which is performed by splitting the stock (which is first cut obliquely, and then smoothed horizontally across the top) diametrically, and afterwards inserting, in a vertical cleft made by a point of the pruning-knife, a wedge-shaped scion. If the cleft grafting be with a single scion, the skill of the grafter is displayed in not splitting the stock right across; but if with two scions, he is called terminal cleft grafting, which is another process, inasmuch as here the grafts are not applied to the top of a stock headed down previously, but inserted at a cleft in the middle of the terminal bud. It is applied to the walnut and the fir; and the success of this method with the varieties of the genus Pinus may be conceived when we learn (p. 105) that M. Jules Barotte of Brachay (Haute-Marne) has by it, in open ground or forest, without protecting his grafts with paper caps, as some do, converted for twenty years past thousands of Pinus sylvestris into Pinus Austriaca and P. Laricio. In come respects what is called "saddle grafting" is the converse process to cleft grafting, for in it the stock is fashioned into a wedge shape, the end of the scion lapping over it, so as to suggest the mane. Where the stocks are of moderate size, this method is very successful, and it is applied by French horticulturies to the multiplication is petto of rhododendrums and camellias. What the author of this treatise calls "English grafting" includes ordinary splice grafting (i.s., the exact fitting and binding together of stock and scion are cut with corresponding notches in addition at the ordinary splice; and whip grafting, the old plan of

In some respects what is called "saddle grafting" is the converse process to cleft grafting, for in it the stock is fashioned into a wedge shape, the end of the scion lapping over it, so as to suggest the name. Where the stocks are of moderate size, this method is very successful, and it is applied by French hortical turists to the multiplication is netto of rhododendrans and camellias. What the author of this treatise calls "English grafting" includes codinary splice grafting (i.e., the exact fitting and binding together of stock and scion are cut with corresponding notches in addition to the ordinary splice; and whip grafting, the old plan of heading down the stock and cutting it on one side only to receive the scion, which has a long splice cut, and is partially cleft or notched. Tongue grafting is the most common of these, and we can conserve that the form of it figured in p. 113 is an improvement, in point of solidity and extra security. Why it should merit the name of the "Thunderbolt" method we are at a loss to conjecture. It would be interesting to compare on this point the original with the translation. Our limits proclude our going into the mysteries of root grafting and bud grafting, though both are fraught with interest. The latter is sufficiently popular with our amateur gardeners to induce them to seek hints and assurances from the book itself.

The last quarter of this useful volume consists of an annotated list of plants and trees suited for grafting, with the methods proper to, and the results to be expected from, each. This will be found valuable as well as curious. We gather, e.g., from the account of the "Aucuba" how, by cleft grafting, e.g., from the account of the "Aucuba" how, by cleft grafting being discipus, all the branches of the male stocks, but one, might be grafted with male scions, and on female shrubs one male branch might be similarly introduced." The Garrys, too, may be cleft-grafted on the Aucuba. In like manner, as the Salisburia is a discious conifer, cleft grafting can bring about its fruit-bearing by the union of both saxes on the same stem. Apropos of cleft grafting, by thus uniting scious of the European upon the American varieties of the walnut in the forkings of the branches, a twofold profit, we are assured, may be made of the timber of the stem and the fruit produced by the graft. We might also commod instantous is which the curiosities of grafting vapuhed by experience amply make up for the untenableness of manner middle water whom the material disease of the material is made manufacture in the curiosities of grafting vapuhed by experience amply make up for the untenableness of manner middle water incommend the material disease of manner middle water in the new material materials and the new materials and the new materials are the new materials.

will soon yield its sorn fruit untainted by a single back quality:

It is easy to change a citier apple-tree into one which will have fines. It is easy to change a citier apple-tree into one which will have fines. It is easy to change a citier apple-tree, a wild plant after his an apple of partier in a second with a fruitful one, and to gather in actions: making quinces, and even pears from the hawthord that is planted for the white cheking will thus be conseed with fines the making the paramidal poplar will become an undurelle, and the second of the will be easy to be presented for any yield masts for shape I It is dually seen that this system of shape in the city of the presented in the consequence of the presented in the consequence of the presented in the consequence of the present of the prese

Need more be said to recommend a volume which theory from practical knowledge all the latest discoveries in the art of grafting, and places the whole process within the read of the methodical amateur? An art can never have been meant to languish in neglect or descende, which method means observation taught and suggested to old world materialist. The this was so may be fitly shown from Mr. Blackmer's recommendation of the Georgics, where (see Book II. 90, and mentioning some curious results of grafting, the post authors the modern art of grafting in the following pertinent lines:

Nor is the mode to bud and graft the same.

For where the buds (like emerads in their frame).

Pushed forth the bark, their filmy jarkins split.

A narrow eyelet through the crown is allt;

Herein the germ, a stranger, they compress,

And teach with juley rind to coalesce.

To graft—the knotless trunks are hoped amain,

And cloft with wedges deep into the grain.

Then fruitful scions are enclosed; nor long

Till a great tree with langhing boughs leaps out,

And looks up with astonishment and doubt

At stranger leaves and fruit that must be wrong.

The S whom the majority are Liberals, will decide thall be approved by Parliament. The thall be approved by Parliament. The that," which has at first an ominous probably a testinical Scotch meaning, ct, has probably a testinical section invaling, floridand it is generally used in a rhetorical or many stage. The practical ingracity of the Scotch bindered them the advantages of Home Rule, M. Many Spinish Control of the Rule.

who had been previously Equity lawyers. The experiment of a single process for all civil litigation may be tried in both countries with at least equal facility. More difference of opinion is likely to arise on the provisions which may be made for appellate jurisdiction. There is much reason to doubt whether Lord Selbonne was well advised in abolishing intermediate appeals in England; and there will be greater inconvenience in any measure which compels Irish suitors to resort to the Courts of Appeal at Westminster, except in cases of importance. The Lord Chancellon and his advisers will not fail to consider with due attention the suggestions which Lord Justice Christian has made in his recent pamphlet. There can be no doubt that the House of Lords and the English and Scotch snembers of the House of Commons will do their numest to render an Irish Judicature Bill efficient for its purpose; but the large body of Home Rule members will, if they think fit, be able to interfere seriously with any project of Irish legislation. It is impossible to deny that they have a right to be heard on all questions, or that they represent important constituencies; nor can it Selborne was well advised in abolishing intermediate or that they represent important constituencies; nor can it be ostonsibly assumed that they are influenced by any but the most respectable motives. Whenever an Irish Bill is proposed, they may object to it either as bad in itself, or because he effecting a weeful motive it meahant the respectable. is proposed, they may object to it either as had in itself, or because, by effecting a useful reform, it weakens the argument for a domestic Legislature. It is also prebable that they may refuse to concur in the establishment of any new Imperial tribunal, although they acquiesce in the appellate jurisdiction of the House of Lords, which theoretically includes a number of representatives of Iroland.

When Mr. Claratony's doubts as to the meaning of Homestics. When Mr. GLADSTONE'S doubts as to the meaning of Home Rule are hereafter solved, it will probably appear that the repeal of the Union implies the repudiation of all enternal jurisdiction. If Mr. Burr and his friends desire to have the designs of an alien Government and Legislature for the good of Ireland, they may probably succeed in defeating the Indicature Bill.

It was already known that the Government had resolved to refer to a new Commission some of the disputed questions between artisans and employers. Some of the workmen have expressed their disapproval of further inquiries on the ground that the issue is ripe for decision; but as Mr. MACDONALD has accepted an appointment as Commissioner, it is evident that the dissatisfaction expressed by Mr. Harrison and by others is not un nimously fult. The appointment of the Commission may pe haps be justified by the value of its recommendations; nor is these any urgent need of immediate legislation; but the workmen urge that all the facts and arguments are already known, and that the Government will in any case be responsible and that the Government will in any case he responsible for the measures which it may ultimately propose. Mr. DISBAELI will probably be disappointed in his expectation that it will be possible to legislate on the subject during the present year. The Cabinot has not yet had that it deliberate on the difficult questions in dispute; and the simplest plat would have been to amagnize and vinding the expediency of adjourning the dispussion to a light seem of the investigation that their interested in the subject of the investigation that their may enterly by less public and less elaborate modes of investigation that their may remember of the investigation that their may remember the proposed changes in the lay subjecting the only and Provident Bogieties may also affect the interests of the members of Trade Unions; but it is the finite easts of the members of Trade Unions; but it is the finite easts of the members of Trade Unions; but it is the finite easts of the members of Trade Unions; but it is the finite easts of the members of Trade Unions; but it is the finite easts of the members of Trade Unions; but it is the finite easts of the members of Trade Unions; but it is the finite easts of the members of Trade Unions; but it is the finite easts of the members of Trade Unions; but it is the finite easts of the members of Trade Unions; but it is the finite east of the members of Trade Unions. framers of the Speech referred to mere matters ery and detail.

The dovernment was in the pleasant position of feeling itself for the moment secure from sarcasm, which was more fikely, if any members of either House were in a satirical to be directed against the losing party. The Ministers had therefore no scruple in announcing a measure for the relief of the licensed victuallers, which an Opposition enjoying better spirits would have plausibly described as a landable proof of gratitude for services recently rendered. At a later period of the evening Sir WILFEID LAWSON, with the courage of a good man struggling with adversity, gave notice of the reintroduction of the Permissive Bill, which the timidest of publicans no longer contemplates with alarm. It must be intolerable to the few votaries of total abstinence who are still found in the House that the victorious victuallers should receive a public testimonial from the hands of the Government. When the measure is introduced it will probably be found to be of the most innocuous kind. Sir H. Selwyn-Ibbetson will, as Under-Secretary at the Home Office, probably be charged with the duty of introducing the remedial Bill; and it is too much to be feared that the original author of one of Mr. BRUCE'S Bills is still lukewarm in his devotion to the interests of beer. The licensed victuallers have some real grievances to complain of; and probably, if the late Government had remained in office they would have obtained redress. The task imposed on the justices of regulating the hours of closing is invidious; and it will be desirable to effect the same object by legislation, applicable with a certain elasticity to towns and rural districts. With the exception of the Land Transfer Bill, all the measures noticed in the Queen's Speech are of so modest a kind that they would in an ordinary Session not have been honoured with formal mention. The country is well satisfied that no ambitious legislation is proposed.

THE MAJORITY OF THE

occasion of a

THE majority of the PRINCE IMPERIAL.

PRINCE IMPERIAL has been made the a much greater great Bonapartist demonstration, and success has attended this demonstration, importance is unquestionably larger, than and its politic time ago could have seemed possible. All the ago could have seemed possible. All the ago could have seemed possible. All the personages of the party came over, numerous deputies and senators, and crowds of dismissed Imperialist prefects. There were, too, a sufficient number of humbler adherents to show that Imperialism has a large hold on the affections to show that Imperialism has a large hold on the affections of some who do not expect to get any personal gain out of a restored Empire. That it was a sham demonstration, or a demonstration of mere fortune-hunters, is quite inconsistent with the facts. The Bonapartists came there partly because they must be Bonapartists or nothing, but in a much greater degree because they liked and regret the system of the Empire. Even outside the Imperial clique there is a growing feeling that the late Emperor was in some measure hardly judged, and that he was unjustly condemned as solely responsible for mistakes which others, and it may as solely responsible for mistakes which others, and it may be said France itself, shared with him. Royalty, too, has in itself abiding attractions, and those who wish in France to worship royalty are driven to Chislehurst to find a vent for their feelings. They cannot take any sincere interest in the antiquarian fanatic of Frohsdorf, and it would be as easy to love a respectable bronze statue as to love the Count of Paris. At Chislehurst they find an heir to a Crown who is at least amiable, who is intelligent enough to scho the pet phrases of his set, who behaves with commendable moderation and self-respect, and is in every way as creditable a lad of eighteen as admirers could hope to discover. The EMPRESS, too, has attractions which once charmed a Court, and a character which is fitted to secure the respect and admiration of well-wishers, if not to command the sympathies of a nation. Royalty at Chielehurst mand the sympathies of a nation. Royalty at Chialchurst is royalty in an imposing and winning shape, and the Bonapartists may justifiably claim that this is an advantage on their side which it is something to be able to offer to France. There are many persons in France, and very many in Paris, who want a Monarchy for other than political reasons, who think that trade will languish without a Court, who like having great people to see and talk about, and who comfort themselves with believing that things are more likely to keep quiet for a year or two if there is some one. Feelings such as the commonly left out of the rackoning when poli-

tical calculations are made; but public epinion on political questions is really the fruit of many other things than political theories. *To say that France withes for a Monarchy is probably quite untrue of France at present. France takes every possible occasion to protest against having a Monarchy farced on it. But it is also true that there are very many persons in France who is not exactly Legitimists, or Orleanists, or Bonapartists, but who exactly Legitimists, or Orleanists, or Bonapartists, but who feel that a Monarchy might possibly help to fill their empty pockets and would certainly give them a good deal of temporary amusement. To such persons the Bonaparte family has, it must in fairness be acknowledged, very considerable attractions. The Empress and her son are fitted to be the centre of a Court, they have had enough of misfortune to make them interesting, and yet have not been fortune to make them interesting, and yet have not been far or long enough removed from the sphere of French life to stamp them with that old-fashioned impracticable character by which Royal exiles are generally marked.

The Duke of Papua made a speech to the Panca, and the Princemade areply, of which all that need be said is that they were very well suited to the occasion. When an Imperialist talks to the son of his late master about the Pance's father and the Prince has to speak of his father and mother in return, it was impossible that any but the best features of the character and the happiest incidents of the career of Napoleon III. should be brought into prominence. That the late Emperon began his reign by corrupting the troops, shooting down hundreds of innocent people, and gorging with plunder a set of needy adventurers, may be historically true, but the Imperial family and its friends cannot be expected to refer to these things. It is also historically true that there was a much brighter side to the reign and character of the Prince's father, and on this side it was equally pleasant and justifiable to dwell exclusively. The late EMPEROR was a singularly kind-hearted man, a faithful control and a salitification. friend, and a politician who anxiously tried to avoid commonplace and routine administration, and to grasp such ideas as seemed to him statesmanlike. In the same way the stock Napoleonic traditions and ideas are capable of being exhibited in attractive colours we do not inquire being exhibited in attractive are practically managed, the too curiously how plebiscites are practically managed, the Napoleon dynasty has had plenty of popular approval in its time. It really is democratic, if by that is meant that it is not the pet and plaything of an aristocratic caste, and that it became align a stoody contamp. For Declination

that it keeps alive a steady contempt for Parliamentary government. It also did for a considerable period manage to identify itself with the interests of three great powers in France—the army, the priests, and the peasantry; and even now the officers, if not the private soldiers, of the army look with affection on its memory, and the priests take good care to let it be known that, even if they would have preferred to see HENRY V. on the throne, they will be very well content if they see NAPOLEON IV. reigning instead. Whether the peasants can be coazed or frightened back into wishing for an Imperial restoration remains to be seen. Those who settled what was to be said to the PRINCE IMPERIAL and what the PRINCE should say in return showed tact as much in what was not said as in what was said. There was nothing to inspire an alarm lest France should be hurried by an Imperial Government into a funnous grusade for the restoration of the Temporal Power. There was no hittorness towards approximate the same that if for the restoration of the Temporal Power. There was no bitterness towards enemies, nor any sign that if his party triumphed the Prince then would have recourse to that bloody sword of justice which the rival Pretender expressed last autumn so much anticipatory delight in the prospect of using. Nor was there any hurry in grasping at the prize before it is ready. The Paince has full confidence that his father's old friend and communicate has full confidence that his father's old friend and companion, the Duke of MAGENTA will give him as good a chance as any one else. The Prince offers himself merely as an amiable and willing young person, who will any day under-take to govern France if he is asked, and who meanwhile will go on pursuing his studies with laudable assiduity.

There is nething to quarrel with in this. He will go or
stay away as he is wanted, and the only question is whether

stay away as he is wanted, and the only question is whether the studies are likely to be arriently surfailed. If it had not been for the Duke of Hacoura, the natural answer would have been that, in spite of this great dame stration, and the specthes, and the violet and gold of the regrets of dismissed officials, he would never have had sime to go on studying antil he had become very learned man. But with the Duke working hard him night and day, making a Republic impossible, and a Robert successible Assembly impossible, and a Roberts.

impossible above really is no saying but that the Prince may be Emperor before long. M. Traine semarked to the Duke of Buogarz and his alies, when the vote of the 24th of The was impending that they were displacing him to make room by the Empire. This was exactly what they thought they were wrong. While the PRINCE IMPERIAL has been enictly doing his lessons, and never dreaming of the kind friends he had in an unexpected quarter, they have been clearing one obstacle after another out of his path. We must bowever, add in fairness that the path. We must, however, add in fairness that the Prince has also lately received much assistance from another set of his adversaries. The Assembly has occupied itself for more than two years in collecting and publishing Reports about the Government of September, and the mode in which it conducted the war, and these Reports have been, if not palpably unfair, so drawn up as to create as unfavourable an impression as possible of the Republican beroes. The numberless errors, follies, and faults of the young Dictator and his friends have been brought into a blaze of daylight. M. GAMBETTA himself has been very discreet; he has held his tongue, striven to avoid offence and accepted so far as he possibly could the leadership of M. THIERS. But he cannot get the French world to forget his past altogether, and the memory of adverse critics is being continually refreshed by the publications of the Assembly. The amount of respect paid to the once powerful members of the Government of the 4th of September is now very small, and the blunders they made are the prevailing topic of public conversation. These tales of Republican misdeeds have been exceedingly useful to the Imperialists. Any one who looks down the list of those who made part of the Chislehurst demonstration will see many names which would lately have provoked utterances of indignation or contemptuous pity. But now there will be many Frenchmon who will merely shrug their shoulders and say that after all the other lot were as bad. To be the last but one sot of people found out is a great element of success in French politics, and the Imperialists seem entitled to claim this element as their own. There are indeed many Frenchmen who will judge the Chislehurst demonstration from a higher point of view, who will ask why France should be deceived once more by the platitudes of crowned democracy, or why honest men should not do the best they can for their country without troubling themselves whether M. their country without troubling themselves whether M. ROUBER or M. GARBETTA made the most mistakes some time ago. But then these are precisely the Frenchmen whom the Duke of Broglis is trying so hard to snub, enfeeble, and exclude from public life; and if he succession holding on in his course much longer, they may lament the restoration of the Empire without being able to prevent it.

THE DEBATE ON THE ADDRESS.

THE debate on the Address would have been a very tame affair had it not been for the speeches of Mr. Graderons and the Duke of Somerser. Sir William Stirling-Maxwell, in proposing the motion for the Address, made some inoffensive remarks on the catastrophe which has befallen the Liberal party; and this gave Mr. Graderons an opportunity of referring to the recent dissolution, to the causes that had led to it, and to the results that have flowed from it. He had, however, nothing new to reveal as to the history of the dissolution. He could but say that the clottons of the autumn made them feel still more uncomfortable. As soon as the Revenue returns made it clear that there would be a large surplus, Mr. Graderous determined to de something splendid in the way of finance. But for this purpose he needed, as he says, increased Parliamentary strength, and a renewal of the confidence of the country. He did not notice the main objection to the course he took, which is that he did not really ask for Parliamentary strength to help him to spend his surplus as he pleased, but used his satisfiated must be get him Parliamentary strength. It was the first way to maintain silence on this head. Mr. Graderous made a great mixture, and he is probably as fully sware as any one clear that the made it. Lord Suspense and in the other House that this war not the first time a lifetime had gener to the country on a flamentary question. No one complains

that Mr. GLADSTONS went to the country on a question. What is alleged against him is that it makes capital out of a particular financial position, and, without raising any distinct financial question, promised to perform a financial feat which he fancied would be specially wolcome to the constituencies by means which he did not explain. What he did was to come before the electors without any political programme or any distinct financial programme, but with the offer that, if they would give him a new lease of power, he would put more money in their pockets than they could have hoped was possible. However, all this is an old story now, and the warning given has been sufficiently clear and strong to make it very un-likely that any other Prime Minister will repeat Mr. GLADSTONE'S dangerous experiment. When Mr. GLADSTONE passed from the causes to the results of the dissolution passed from the causes to the results of the dissolution he got on much safer ground. Sir William Struing-Maxwell had expressed a natural regret that six weeks of the Session had been lost. Mr. Gladstone replied that it was quite worth while to lose six weeks of a Session in order to get a Parliament and a Ministry in harmony with the real wishes of the country. This is manswerable. As a Liberal and a Minister, Mr. Gladstone of course regretted the decision at which the constituencies arrived but as a friend of the at which the constituencies arrived, but as a friend of the Constitution he was delighted to think that England did constitution ne was designed to think that England did not, like a neighbouring country, exhibit the spectacle of a popular assembly sitting on and legislating with the feelings of the people arrayed against it. At any rate Mr. Gladstone has escaped the humiliation of being a second Duke of Broques. As Mr. Gladstone did not expect the elections to turn out as they did, he does not intake his disconting at the and of transmission. justify his dissolution at the end of January by pointing out that a national benefit which he never contemplated has resulted from the course he took. But this does not prevent it from being true that the dissolution has produced this national benefit; and no one can deay that the time had come for a new Parliament and a new Ministry, when it has been so conclusively shown that the old Parliament and the old Ministry had lost the confidence of the country.

The Duke of Somerser was as ill-natured as it was possible even for the Duke of Somerser to be, and the expressions of his ill-nature were so coarse and over-charged that his purpose was defeated and he did harm to no one but himself. The Duke calls himself a Liberal, and there are no doubt questions as to which his Liberalism is indisputable. But he is one of that disagreeable class of Liberals whose main delight and occupation consists in finding fault with whatever Liberals do, vituperating Liberal statesmen, and exaggerating the errors and blunders of his party. If any Conservative had said what he said, every one would have exclaimed that a manifestation of such virulent feeling from the lips of an opponent was in the worst con-ceivable taste. But because the Duke chooses to call himself a Liberal, he imagines himself to be above all the rules of taste and decorum. He first took occasion to bespatter the new Peers whom Mr. GLADSTONE has sent to the House of Lords, and ironically observed that some of them would be of great use to their Lordships, as, if they wanted to understand how the Post Office could be mismanaged, they would have Lord EMLY at hand to explain the secret to them, and Lord ABREDARE would be equally available if they had any difficulty in comprehending what was the best means of getting up a serious quarrel with the licensed victuallers. No doubt Lord Emr. did make a shocking mess of his administration of the Post Office, and Lord ABERDARE blandered and shifted till he made the publicans as mad as bulls. But there is a time for abuse and a time for refraining from abuse, and the first night of the meeting of a new Parliament was certainly not the time for a Liberal to decide two humble members of a fallen Liberal Ministry. When the Duke passed to speaking of Mr. GLADSTONE, his violence went beyond all bounds. He described Mr. GLADSTONE as coquetting with those who wish to dismember the Empire, and as licking the very dust off the feet of democracy. There was, no doubt, a basis for these excessively strong phrases. Mr. GLADSTONE'S letter to Lord FERMOY about Home Rule was not what it should have been. He professed that be could say nothing for or against Home Rule until he understood what was meant by the term. Lord SELBONNE replying to the Duke of Somensur, said that there could be no doubt about Mr. Gladsroug's real opinion of Home Rule, because he had stated some time ago at Aberdeen

that no statesman could entertain any proposal for dis-membering the Empire. This would have been very membering the Empire. This would have been very satisfactory if only he had repeated it on the eve of the Irish elections. The impression produced by his letter to Lord Fermor was not that he would consent to the dismemberment of the Empire, but that, in order to catch Irish votes, he affected not to understand what he understood so well some months before when speaking at Aberdeen, that Home Rule did mean the dismemberment of the Empire. By thus striving, and striving in vain, to win Irish votes at the cost of some want of straightforwardness, Mr. Gladstone lost many English votes, and deserved to lose them. It is equally true that Mr. GLADSTONE has sometimes seemed to look with injudicious favour on schemes of change which may be called in the bad sense of the word democratic. But that he licked the dust off the shoes of democracy is a statement absurdly untrue. What is much more true is that his term of power came to an end because, among other reasons, he would not fall in with the extreme section of his party. Even, however, if the Duke of Somenser had been as guarded and accurate in his language as he was wild and inaccurate, he would have been choosing the wrong time and place to make his remarks. The Ministerial leaders showed themselves far above taunting and abusing opponents who have just been decisively beaten, and an isolated and unimportant laboral might have had the decency to follow their example.

There was no topic in the Address to call forth much comment or any excitement. Every one united in praising the conduct of the troops and their officers in the Ashantee war, and the time had not come when any one could pretend to say what use England is to make of its victory. Whether Parliament should have been summoned at the outset of the war was a nice point of constitutional law, which was languidly and indecisively debated by the leaders of the two parties in the Commons, much in the spirit in which the Curer Justice seems to have debated with himself the mysterious point whether it was his duty to report the arrest of Mr. WHALLEY to a House elected after the arrest was at an end. The Indian famine was a subject of discussion that could not fail to excite interest, and Mr. M'Cullage Torrens went so far as to propose in regard to it. One of those amendments to an Address which are made to be withdrawn, but sure to give their maker an opportunity of speaking at greater length on a subject than he would otherwise venture to do. The Government has done all it can do by promising to afford at the carliest possible moment all the information it can command as to the extent of the famine, and the means taken or to be taken to alleviate it; and the announcement of the inten-tion of Ministers to bring in a Bill to supply India with funds is the best indication they could have given of their sense of the magnitude of the calamity, and of the exertions that must be made to meet it. It is not impossible that the famine may have the effect of directing the attention of the present House to India in a degree unknown to its predecessor; and for this, as for other reasons, men of all parties may join in the wish that Professor FAWOTT, who was the one man out of official circles who cared for India, may soon take his seat again in Parliament. Every one either acquiesced in the small legislative programme which the Ministry offers, or congratulated them on its smallness. Mr. GLADSTONE had no fault to find, nor any doubts to suggest, except as to the appointment of a Royal Commission to report on the laws relating to masters and servants. Whether the step taken by the Ministry is a good or a bad one will depend on its practical The first thing a Government has to do which appoints a Commission under such circumstances is to get persons to take part in its labours whose decision will command confidence and respect; and in this respect tho Government has been so successful as to fill with vexation those leaders of the Unionists who resent that there should be a Commission appointed. The next thing is to see that, if possible, the Commission shall work hard enough to presont a Report so early as to preclude the suspicion that the real use of the Commission is to get the whole question shelved. Mr. DISRAELI expressed his entire confidence in this second kind of success being achieved, and we can only trust he may be right.

THE FAMINE IN BENGAL.

L ORD SALISBURY'S promised statement as to the position of affairs in Bengal and the measures which it is proposed to take in consequence will not come too soon. In the absence of such information, it is hard to determine how far a newspaper Correspondent, new to India, can be trusted to distinguish between avoidable and unavoidable obstacles to the prompt and regular distribu-tion of food supplies. But Mr. Fornes's letters in the Daily News tell of delays and confusion which to all appearance might have been prevented if the work had been taken in hand a little earlier. The Indian Civil Service has been often credited with military as well as with civil virtues, and considering that the famine was foreseen early in the autumn, and that the transport difficulty was singled out from the beginning as that which would give singled out from the beginning as that which would give most trouble, it seems strange that we should now be hearing for the first time of measures of organization. It is intelligible that the means of carrying food to the remoter villages can only be devised as the necessity arises, but the difficulties now spoken of are what may be called main-line difficulties—difficulties about ferries, difficulties about transshipment, difficulties about cradients difficulties about transports of the second secon gradients, difficulties about tramways and new lines of railroad. It is intelligible again that many of these obstacles should not yet be got out of the way, because the labour of surmounting them has proved greater than expected, and consequently that the original calculation of the time required has been found too short. But it is not so easy to understand why in the middle of February many of these elementary works should be at most only just taken in hand. In November last Bengal was in the position of a territory threatened with invasion, and it might have been expected that in the interval between that date and the appearance of the enemy inside the frontier all the obvious obstacles to the passage of supplies would have been removed. Or, if this expectation involves too low an estimate of the amount of work to be done, it might still have been expected that the operations necessary for removing conspicuous obstacles would long ago have been begun. Lord Derry said on Thursday that the machi-nery for taking food to the people cannot be extemporized with effect. That is, no doubt, true of the machinery token as a whole; but when we hear of machinery now just beginning to be constructed which, when finished two months hence, will make this or that part of the work go smoothly, we are tempted to ask why the process was not started two months earlier, so that its completion and not its commencement should have synchronized with the first stress of the famine. It is quite possible that there may be a good answer to the charge of procrastination implied in Mr. FORRES'S letters. It may be that the Government of India has been working its hardest ever since the autumn; and that what to persons at a distance, or even to persons on the spot who are new to the work, seems like needless delay, is really the inevitable delay which arises from being short-handed. The papers about to be laid before Parlament, and the explanations from the SECRETARY of STATE by which they will be accompanied, will probably clear up all doubts upon this head.

The Bill introduced by the Under-Secretary of State for India will give ample opportunities for examining the financial side of the famine. What Mr. TORRENS proposed to effect by the amendment he moved to the Address is not very clear. The House of Commons may be trusted to give proper attention to the subject without a formal assurance of the interest and anxiety which it intends to bestow upon Lord GEORGE HAMILION'S Bill. To commit Parliament to an undertaking not only to alleviate the existing distress, but also to prevent as far as possible its recurrence in the future, would have been an act of impredence which it is startling to find suggested even by an amateur Indian legislator. It is one thing to say that in meeting this sudden demand on its treasury the Government of India shall be assisted from Imperial resources, and another thing to say that the cost of an resources, and another thing to say that the cost of an adequate system of irrigation is to be thrown upon the English taxpayer. Probably Mr. Torrans did not into pledge the House of Commons to anything so printing as this, but this is certainly the sense in which the last clause of his amendment would have been accounted as Indian.

The want of logic which so often characteristics.

sectings. There are two views as g the calamity in Bengal between asonably be divided. One is that at some recent relief meetings. to the means of meeting the which opinions may reasonably be divided. One is that the cost of feeding this vast population for a great part of a year should be borne by the Government of India. The other is that the burden should be shared by the Imperial Government. There are cogent arguments alleged in behalf of each of these views; but for a third view which just now seems popular with the English public there is simply nothing to be said. We are well aware that in questioning the action of the Relief Committees in London and elsewhere we run counter to no less eminent an authority than Lord LAWRENCE. And if Lord LAWRENCE had given no reasons for his opinion in favour of raising money by private subscriptions, we should have hesitated before opposing it. But by resorting to argument he has descended to the level of common men, and his reasons are those of the philanthropist, not of the ex-Viceroy. The letter of the Bishop of Man-CHESTEE in the Times of Thursday proved this beyond dispute. Lord LAWRENCE's case amounts to this, that the Clovernment of India will want every farthing it can get, and that there are a large number of sufferers whom Government aid cannot reach. The first plea, literally interpreted, would mean that the subscriptions which Lord LAWRENCE calls for are to go to aid the Indian revenue, and we do not deny that, in itself, this would be a very proper form for private benevolence to take. But the question is, whether the Indian revenue will, in the long run, be really benefited by aid of this kind. Charity can at best provide for but a fraction of the expense which the Government of India will have to incur, and yet the fact that it has been helped in this way may make the notion of a direct grant from the Imperial Exchequer more unpalatable to the English taxpayers than it otherwise would be. It is pretty clear, too, that if the theory that the subscriptions go directly to aid the Indian revenue, and only indirectly to relieve the sufferers from the famine, were made public, the flow of liberality would very soon be checked. An impoverished exchequer is too impersonal an object to excite general sympathy. It may be taken for granted, therefore, that when Lord LAWRENCE says that the Indian Government wants English money, he only means that the subscribers need not fear that there will be no use for their money when it gets to India. Lest, however, this general assurance should not be sufficient, Lord LAWHENCE dwells on the impossibility of reaching all the sufferers by machine the impossibility of the control of the nery so systematic and unclastic as Government aid. argument is completely disposed of by the Bishop of Man-CHESTER. It would be perfectly applicable to distress in England, or in any country where a private charitable organization might be set up in every parish. But over the greater part of Bengal there will be no one to distribute relief except the officers of the Government; and it is not easy to see how the mere fact that he is administering a private fund can give an official power to deal with particular forms of distress which he would not possess if he were administering Government funds. Apparently a "famine wallah" is, after spending twelve hours or so every day in superintending public works and the distribution of food at relief centres, to spend an hour or two in the evening in searching out sufferers "of gentle birth," and relieving them from the private purse made up for them in England. While engaged in this inquiry his whole demeanour and aspect is to undergo a mysterious change. At six o'clock, while giving relief on behalf of the Government, he will be the hard, determined official. At seven o'clock, the consciousness that he is administering charitable, not State, relief will have softened his voice and smoothed his brow, and converted him into a ministering angel. This is the fond belief of the Mansion House Committee. We think it more probable that the same man will distribute what will practically be the same fund in the same manner and on the same principles. He will have no time to pursue fine distinctions, or to keep in mind that one bag of rice out of every hundred has been paid for by private subscription, and must therefore be distributed differently from the ninetynine which have been supplied by the Government. What the few hundred thousands which will be contributed by the few hundred thousands which will be contributed by private charity will do for the relief of a calamity on which the Government will certainly have to spend millions, and is bound to spend all that is required, it is needless to calculate. It is satisfactory, however, to remember that, considering the uses to which money nominally spent in charity is called applied at home, it may be a

real advantage to get a certain proportion of it sent out of the country. From this point of view, at all events, we wish success to the Relief Committees.

ENGLISH POLICY ON THE GOLD COAST.

THE successful close of the Ashantee war is regarded with universal and unqualified satisfaction. It matters comparatively little whether the King holds himself bound by the treaty which has been tendered for his acceptance. He will probably not discontinue the practice of human sacrifices, and his payment of the remaining instalments of the compensation demanded by Sir Gabner Wolselley will, if it is made, produce surprise as well as satisfaction. It seems not improbable that the foreign invasion may be followed by civil war. The relations of the great feudatories to the Kino are imperfectly understood, but it may be conjectured that, like ambitious chiefs in all parts of the world, they will renounce their allegiance if they are no longer held in subjection by fear. Whether a revolt of some or of all of the outlying tribes would destroy the Ashantee power is at present uncertain. The chief of Adausi retains so much respect for his former sovereign as to think it prudent to retire from the Ashantee territory as seen as he seconded from the Empire or Confederacy. The more powerful chief of Beequah, who also meditated the recovery of his own independence, may perhaps think himself strong enough to retain his dominions while he repudiates Ashantee supremacy. There has to the present time been no rumour of a rebellion in the Ashantee country itself; nor is it known that the people of Coomassic and the neighbouring country are discontented with their sanguinary ruler. The effect of the late defeat on the relations of the Ashantee kingdom with the population of the interior is uttorly unknown. Recent events have sufficiently proved that the warlike reputation of the Ashantees was well founded; and they are still more than a match for enemies who are not superior to them in weapons and discipline. Fortunately the interest of Englishmen in the politics of Western Africa is now once more of the faintest and most purely philanthropic character. The Ashantees have been temporarily disabled; and perhaps they have been permanently intimidated. They have no means of knowing the extent of trouble which they have occasioned, and probably they are not at present inclined to undervalue the resources of England. It is indeed suggested that they would be formidable enemies if they possessed arms of precision with suitable ammunition; but cartridges adapted to Snider rifles cannot be procured in unlimited quantities; and probably some check will be placed on the importation of weapons. The money which has been spent in the campaign may fairly be credited to a capital account. The country south of the Prah has been practically secured against invasion for several years. If he confidence of the Ashantees hereafter revives, it may perhaps be necessary for those who then administer colonial affairs to repeat the lesson of the recent war. task of government and protection will in the meantime have been greatly simplified. The loss of life which has been incurred is greatly to be regretted, but it has happily not been excessive.

The full accounts which have at last been published confirm the impression that the campaign has been couducted with laudable vigour and prudence. Sir GARNET Wolseley had already promised the evacuation of the districts which are more or less under an English protectorate before the arrival of his troops from home. His original attempts to secure the aid of the Fantce chiefs proved utterly abortive. It was found useless to assure them that the quarrel was their own, and that the sovereign Power only proposed to supply their deficiencies. They have perhaps since been confirmed in their opinion that the English Government had objects of its own, and that it was strong enough to defeat the Ashantees without native assistance. As soon as the troops from home were ready to disembark the General marched without delay through a now friendly country to the Prah; but, as he moved away from the coast, he naturally felt more and more the embarragement arising from an insufficient supply of carriage. It is said that some desponding officers of Control declared that the expedition had failed, and that it would be necessary to return with all speed to the const. Fortunately the General was not inclined to yield to the first appearance of difficulty; and it happened that

the enemy, by making overtures of negotiation, provided an excuse for a halt which would in any case have been unavoidable. By this time Sir Garrer Wolseley has probably reconsidered his hasty charges of treachery. While the invading troops were waiting for the collection of native carriers, and while the Ashantce army was gathering in front of the capital, both parties amused their opponents with discussions of the terms of peace. The hostile intentions of the King were discovered about the time at which the English general was again ready to move. Then came the four days of fighting which ended in the capture of Coomassie; and the continuing difficulty of obtaining supplies compelled Sir Garner Wolseley to burn and evacuate Coomassie, and to commence his return march without delay. The exploits of Captain GLOVER deserve the fullest recognition. With the aid of a few English officers he contrived to create an army on the Volta; and although he was deserted by a large portion of his troops, he ultimately marched on Coomassie with a force of between four and five thousand men. His advance must have been known to the Ashantees when they were engaged with the main body of the English; and there can be little doubt that Captain Grover effected a diversion of the highest importance. It is highly satisfactory that his line of retreat to the coast took him through the ruined town of Comassie. Any returning confidence which the Ashantees may have derived from Sir Garner Wolfeley's rapid retreat must have been destroyed by the arrival of another English force on the ground which had been evacuated a few days before. In the distribution of honours and rewards, Captain GLOVER and his assistants will certainly not be forgotten. The art of training and commanding barbarous auxiliaries is essentially Imperial and characteristically English.

The Cabinet will perhaps entrust to Lord CARNARVON the preparation of a policy to be permanently adopted on the West Coast of Africa. Lord DERBY's intimation that former errors will be avoided requires further explanation; but some modification of Lord GREY's proposal will probably be adopted. After the experience which has been acquired of the unfitness of the Fantees for military operations, all plans for organizing a native army must be abandoned. Lord GREY would limit the linglish possessions to the ground which is covered by the guns of the forts, and he distinctly disclaims all intention of founding or maintaining a protectorate. During his official career Lord GREV was perhaps too much inclined to establish constitutions in all English dependencies; but he Astly declares that a representative Government in the Fantes country would be a mere absurdity. The chiefs should, in his opinion, be encouraged or compelled to form among themselves a Confederacy, which nevertheless should not be allowed either to exercise power or independence. It would be the duty of the Governor to determine on all important measures, and it would be the humble function of the native Council to execute his orders. Although it is at first sight difficult to distinguish between sovereignty and the exercise of absolute authority, Lord Gazy suggests possible reasons for the institution of the double government which he proposes to construct. The laws and customs of the country cannot be conveniently abolished; and yet it is impossible that they should be directly administered by English functionaries. The system of slavery which prevails not only in Western Africa, but in all sountries which have not reached a certain level of civilization, must be tolerated, and cannot in accordance with English habits of thought be openly acknowledged. The native chiefs will be exclusively responsible for the faults of their domestic institutions, while the Government as an external authority will control their commercial and political relations. Lord GRET refers with merited praise to the success of Governor Maclean, who forty years ago contrived both to govern the country almost without support from home, and to maintain friendly intorcourse with the Ashantees, who had shortly before defeated and slain an English general officer. It is perfectly true that some uncivilized tribes, and some more perfectly true that some uncivilized tribes, and some more advanced communities, can only be efficiently managed by a ruler who possesses the peculiar gift of making himself oboyed. When society in Jamaica had been completely disorganized eight or nine years ago, an Indian civilian entracted with the necessary powers rapidly restored order and prosperity. His successor has been judiciously milected them the same incomparable nursery of administration and statement. It might perhaps be difficult to socure for the Gold Coast the services of an Indian of great official experience; but there is reason to hope that a post not generally attractive will be hestowed with exclusive regard to personal fitness.

CHISLEHURST AND VERSAILLES.

IF the English Liberal party, when at the height of its power, had repealed the Septennial Act, and entrusted the right of dissolving Parliament to the House of Commons, we might still have been governed by a Liberal majority of sixty-six. If it be further supposed that Mr. GLADSTONE had just introduced a Bill to restrict the franchise on the avowed ground that, with the suffrage as it is, the Conservatives are certain to carry all the partial elections, the parallel with the existing order of things in France will be complete. The Assembly cannot be dissolved except by its own act, and the majority of the deputies are so well assured that their constituents are tired of them that they are ready to support any Government which will put off a general election. Their last hope is placed in the new They know that they do not represent the Electoral Law. constituencies as they are, so they are going to try whether they cannot so remodel the constituencies as to convert they cannot so remodel the constituences as a conven-them into something which they can represent. The first election which is held after the new Electoral Law has been passed will perhaps convince them that this hope has no foundation in fact, and when this becomes clear they will doubtless dread dissolution as much as they do now. A Parliamentary Government which dares not go to the country, and knows no other attitude than that of simply clinging to life, is so ridiculous an anomaly that any moderately consistent form of government looks respectable compared with it. A pure despotism is preferable, because the despot has at least force on his side, whereas the Duke of Broglin and his creatures have only the reflected strength which is derived from Marshal Mac-MAHON. A despotism resting on a plébiscite is preferable, because, though a popular vote taken without discussion, and without the filtration that comes by election, is the worst possible way in which a nation can express its mind, it at least proves that the nation acquiesces in the rule imposed on it, though it may do so carelessly and ignorantly. The Government which the Duke of Brogers has undertaken to administer has the form without the power of representation. It is professedly based on popular consent, but as popular consent is not forthcoming, it is quite pre-pared to dispense with it. The Bonspartists who arranged pared to dispense with it. The Bonapartists who arranges the little festivity at Chielehurst are well aware of the opportunity which the Duke of Buoglin's policy gives them. Government by plébisoits cannot hold up its head against real Parliamentary government, but it has an immense superiority over a sham Parliamentary government. If the French people were really represented at Versailles, the address of the Preson Imperial has Monday would be a many traditional equalities of a fakehood which. would be a mere traditional repetition of a falsehood which, in ceasing to deceive, has ceased to be hurtful. But, by the side of a mock Legislature sitting by the grace of the army and willing to submit to any usurpation, even an Imperialist Restoration may have attractions. Government by plébisoite is not what the Passon describes it; it is neither safety, nor right, nor extrength restored to authority, nor an era of prolonged accurity reopened for France. But it is a more colourable imitation of all this than the existing Government. If the Duke of Brocker, instead of introducing a new Electoral Law, had appealed to the country, and an Assembly had just been returned which expressed the unmistakable desire of the French nation to live under a moderate Republic, there would have been something ludicrous in the assertion that public opinion is irresistibly attracted towards a direct appeal to the nation as the necessary foundation of a legitimate Government. If every French constituency had just been choosing its representatives in the Legislature, the assumption which underlies the Phinar's words would have been obviously untrue. As things stand, it is not obviously untrue. On the contrary, public opinion is convinced that without an appeal to the nation of some kind a definitive Government is impossible, while it is at a loss how to bring about this appeal so long as the Duke of Brooks and his

In such a conjuncture as this in Boundaries, have one great and standing about their own principles flow

plebionite afterwards. Parliamentary statemen have a spect even for the dead forms of Parliamentary government, and though the deputies now sitting at Versailles for the most part deputies only in name since who returned them have long ago made it those who returned them evident that they have withdrawn their confidence, there is a technical sanctity about them which it would be well, if possible, not to violate. Though they be but Scribes and Pharisees, they sit in Mosse's seat; and in a country where legal Gevernments have so often been overthrown, there is a natural and proper unwillingness on the part of those who hope that France has learnt something from her late misfortunes to repeat the process even when circumstances might seem to justify it. thing of this feeling was probably at the bottom of M. THISRS'S prompt submission to a vote which he knew would not be confirmed if the issue could be transferred from the Assembly to the country. A Bonapartist has no soruples on this head. A plébisoite is to him an all-sanctifying and all-absolving process; and as for Parliamentary government, he would gladly see it discredited as the only dangerous rival of his darling fetish. Consequently, no neurping Government can afford to despise the Bonapartists. There is a power in their mock appeal to the people which can only be overthrown by the greater power of a real appeal to the people. The accident of a Bonapartist general finding himself in command of the army, or of any important fraction of the army, might be enough to give the party the momentary control of affairs, and even a momentary control would enable them to bring a plébiscite into play. Addressed to a nation which had the power of giving complete expression to its wishes in a freely elected Assembly, the Bonapartist trick would be harmless. But, addressed to a nation which is governed by the Dake of BrogLie without a plébiscite, it may be more successful. It is estimated that the new Electoral Law will disfranchise three millions of Frenchmen. A certain number of voters will be struck off by the postponement of the political majority until twenty-five; a large number more by the provision requiring three years residence from every voter not born in the Commune, unless he is qualified under the tax-paying franchise. Under such a law as this the mouths of the Bonapartists can never be completely closed. They can always challenge the decisions of the Assembly as coming from a body which has deliberately forfeited its claim to represent the country. When they appeal to a plébiseite it will be no longer an appeal from the shrewder and more intelligent representatives to a less shrowd and less intelligent populace; it will be an appeal from a maimed to an numaimed electorate, from the electorate as it has been doctored by the Duke of BROGLIS to the electorate as it was left by Napoleon III. So long as the same men for whom the Bonapartists claim the right to vote Yes or No as regards a particular form of government have the right to vote by their representatives on every question of public concern, the offer of a plébiscite can have no charms. But if among those to whom the Bonapartists'appeal there are three millions whom the Duke of Brogus has deprived of their votes, it is impossible to say what charms there may not be in the thought of regaining them.

The suthors of the Electoral Law would have something to say in their own defence if it were probable that the measure would have the result they expect from it. The majority in the Assembly are disgusted with the course which the elections have uniformly taken. For various reasons they have the thought of a Republic, and they see that in the present temper of the constituencies a dissolu-tion will inevitably establish the Republic. They next assume that by excluding Radical voters the evil may be averted, and that by postponing the age at which a man ted, and that by postponing the age at which a man mes an elector to five-and-twenty, and insisting on mars' residence in the case of electors born out of manuae, this exclusion of Radical voters will be. They must have studied the partial elections to the purpose not to see that the first of these assumpectors born out of groundless. It is not the Radical frightened the Duke of Bacquin groundless. open repudiation of the principles which he he d all his life. His terrors are due to those runs of his new evocation of mint in eing is a moderate Repub. term of Roy

and material progress under the Septements them there would be under a Republic. The assumption that this changes proposed by the Committee of Thirty would get rid of Radical voters is not much measure the truth. In whatever aspect the Electoral Law is regarded, it constitutes a conspicuous monument of the short-sighted fally of its authors.

MR. SUMNER.

MR. CHARLES SUMNER'S name will be long remembered by his countrymen, though to foreigners he scarcely appears to have strained the rank of a statesman. The process of political degeneracy which has affected the United States without interruption since the days of colonial dependence consists, not in the intellectual or moral decline of the American people, but in the constantly growing indifference of the constituencies to the qualifiertions of their elected representatives and rulers. manipulation of enormous numbers of votors naturally falls into the hands of professional managers, who for many easons discountenance eminent or scrupulous candidates. The most flourishing community in the world can happily afford to dispense with the ordinary securities for good government and prosperity. In no other country could the management of the finances be entrusted without ruinous consequences to functionaries ignorant of the rudiments of economic science. The Americans are so rich that they can afford mismanagement of the Treasury; and their habitual independence of government renders them tolerant of official incapacity and corruption. Mr. Summe was of a higher type than the majority of modern American politicians. Representing in the Senate the most highly educated State in the Union, he had himself the advantage of educated State in the Union, he had himself the advantage of literary culture; and at an early age he acquired the reputation of a sound lawyer. When he engaged in politics he attached himself to a cause which was not recommended by vulgar or selfish motives. At that time the agitation against slavery was thoroughly unpopular, except in some parts of New England; and the alliance between the slave-halding interest and the Democratic restriction. holding interest and the Democratic party might well have been deemed irresistible. Of the philanthropists who exerted themselves against the extension of slavery with an ultimate view to the overthrow of the system, Mr. Summer almost alone attained a high political position. As an orator, although his style would not have suited European tastes, he was copious and impressive, and throughout his whole career he was exempt from all suspicion of the corrupt proclivities which were indeed less characteristic of his contemporaries than of a younger generation.

When the violence and rashness of the Southern leaders resulted in political suicide, Mr. Sunner scarcely enjoyed the share which he might have expected in the unforessent triumph of the principles which he had consistently supported. It is uncertain whether he was influenced by resentment for a brutal assault on his person by a member of the slave-holding body, or whether his long-oberished sympathy for the oppressed negroes had biassed his political judgment. He never appreciated the difficulty of the transition from slavery to freedom, or the expediency of reconciling as far as possible the defeated Confederates to the new order of society. In the earlier part of the contest he would willingly have promoted a servile insurrection, and he was probably disappointed by the acquiescence of the negroes in their accustomed condition after the Rapublican party opposed more pertinaciously the policy of closing as soon as possible after the termination of the war the chasm which had been opened between the Northern and Southern States. Mr. Sunner might be possible to pay almost exclusive regard to the interests of the negroes. A stateman ought to have remembered that the superior race also had its rights, although it had not been for the time favoured by fortune. Mr. Sunner's miscalculations in domestic policy were less mischievons than his perverse efforts to create animosity between the United States and England. As the most canner than the perverse efforts to create animosity between the them his perverse efforts to create animosity between the suppointed to the highest post in the Sente, as Chair-land the Committee of Foreign Relations. It might have been supposed that a Englasor, who divided with

the Secretary of State the functions which elsewhere belong exclusively to the Foreign Minister would have understood that the first of diplomatic duties was to prevent the possibility of foreign intervention in favour of the South. It was not unknown to Mr. Summer or to Mr. Seward that the Emperor of the French was anxious to facilitate his Mexican enterprise by combining with England in a recognition of the Southern Confederacy, which might have easily grown into an alliance. A courteous demeanour, and even an exaggerated profession of confidence in the friendly relations of England, would have tended to ensure the maintenance of neutrality if there had been any risk of a rupture. The misapprehension which prevailed in the United States as to the intentions of the English Government and the feelings of the nation might have excused an irritated feeling; but it ought at the same time to have recommended the observance of the utmost caution. Instead of controlling his temper in the interest of his country, Mr. Sumner at a critical moment gratified his own feelings and courted popularity by an extraor-dinary burst of vituperation which would have been undignified if it had followed an actual rupture. At the time when the English Government strained the law by detaining the Confederate cruisers at Liverpool, the Chairman of Foreign Relations denounced its conduct in language which was evidently intended to stimulate feelings of bitterness between the two countries.

The same unreasonable batred of England found expression after the conclusion of the war in the notorious speech by which Mr. Sumner induced the Senate to disallow Mr. REVERDY JOHNSON'S Treaty. To Mr. Sumner belongs the discredit, affecting his character both as a lawyer and as a statesman, of having invented the monstrous claim for some hundreds of millions of indirect damages on the pretext that the English nation was responsible for the acts of two or three Confederate cruisers. It would be a waste of time to revive a one-sided controversy which was afterwards summarily settled in favour of England by an unfriendly tribunal. The passionate antipathy which was exhibited in Mr. Summer's proposterous claim was explained by the defects which prevented him from attaining great-ness as a statesman. He was probably incapable by nature of seeing two sides of a question, and his angry misappre-hension of English policy was aggravated by personal disappointment. Many years ago Mr. Sunner had received in English society even a more cordial welcome than that which is naturally extended to eminent. American visitors which is naturally extended to eminent American visitors. His character, his accomplishments, and more especially his well-known antagonism to slavery, had procured him many admirers, some of whom considered themselves his friends. On the question between slavery and emancipation no subsequent difference could have arisen; but there was a not less material issue on which after the secession English opinion was seriously divided. Mr. Summer had either originated or adopted the wnich was in his judgment amount even to the Constitution of the United States. Few Englishmen ever wavered in the belief that slavery was intrinsically wrong; but the authority of almost every American politician and lawyer might have been cited in support of the right of discontented States to secede from the Union. No judicial decision except the fortune of war has at any time impugned the soundness of the opinion which English politicians shared with Mr. Lincoln and Mr. Seward. A loss vehement partisan than Mr. Sumner would have understood that bystanders may claim to determine for themselves the issue involved in a quarrel as well as the merits of the dispute.

In his later years Mr. Sumner's power and popularity visibly declined. It is not for foreigners to decide how far he was justified in his political hostility to General Grant. There is no doubt that many Republicans of the highest character distrust either the President himself or the advisers by whom he is surrounded; and Mr. Sumner cannot be accused of political puritanism because he was opposed to a combination of which General Butler is reported to be the principal manager. It was perhaps not his fault that the dissatisfaction of the more respectable members of the party was used by election managers to promote the ridiculous nomination of Mr. Greuler in opposition to General Grant. Mr. Sumner before the election addressed an appeal to the coloured voters whom he had so consistently served in favour of the Reform candidate; but he found that his authority no

The coloured voters perhaps judged rightly that their safety lay in the predominance of the orthodox Republican party; nor could they understand how Mr. Summer found himself in alliance with their ancient Democratic enemies. After his re-election General Grant succeeded in pregaring the removal of Mr. Summer from the Chairmanship of Foreign Relations; and probably he would have found, if he had lived, that his political career was virtually at an end. When his weaknesses and errors have been forgotten, Mr. Summer's reputation will probably survive in the memory of his fellow-citizens.

THE BILLS OF THE FUTURE.

A LTHOUGH the present Parliament is likely to be less restless and fussy than the last, there is no reason to suppose that it will not have plenty of subjects to occupy its attention. As soon as the House of Commons met on Thursday, the pent-up energy of a number of eager legislators found vent in a shower of notices of motion. Many of them are of course old friends. A Session without a Bill for the abolition of the Game Laws or a Permissive Bill would come upon us almost as strangely as the Speaker without his wig. They are part of the familiar furniture of the House; and when Mr. P. TAYLOR and Sir W. LAWSON made their respective announcements, old members who had been spared to return to their seats must have felt themselves once more quietly settling into the jog-trot routine of many Sessions. A considerable part of the business of each Session is simply a repetition of what is done every year. The old motions are brought up by the same people, the old speeches are made over again, and the old ceremony in come through of a formal division on a foregone conclusion. is gone through of a formal division on a foregone conclusion. As Mr. Newdegate was returned at the election, it follows as a matter of course that we are to have a motion for an inquiry into monastic and conventual institutions. Mr. TREVELYAN'S Bill to extend the household franchise to counties dogs him like his shadow; Mr. Plinsoll's Bill for the survey of merchant ships is also a part of himself; and Ireland would certainly not be Ireland if some Irish member did not turn up with a motion about that tre-mendous question, the drainage of the Shannon. The Bill for conferring the franchise on women is this year, in the absence of Mr. Jacob Bright, to be brought forward by a Conservative, Mr. FORSYTH; and it is supposed that Mr. DISRAELI may be disposed to smile on it. When the time comes, it is not improbable that the astute Premier may discover that his conviction of the justice of the summer belongs to that purely sentimental order of deas which was represented on another occasion had the famous "his torical conscience." Mr. Right. The reserving International Arbitration for a later 25th Clause, and Mr. Dixon is at hand time in attentory School Roards and computers attended. time in attendance Boards and compulsory attendance as indispensable conditions of political freedom. Mr. Bass is to renew his attempt to enable all debts not exceeding 51. to be repudiated with impunity, without reference to the debtor's capacity to pay what he owes. Sir J. LUBBOCK's modest Bill for the better protection of public monuments will perhaps obtain in a comparatively quiet Session the attention which it deserves. Motions about the Income tax, the Ballot, the Ironclad Navy, the Dockyards, and other matters are also in prospect.

It is evident that, whatever may be the measures of the Government, the House of Commons may be trusted to keep itself furnished with abundant materials for discussion. Tiresome as many of these old subjects are in their monotonous iteration, it would be a very short-sighted view to assume that time is altogether wasted in discussing them. There are in some of them germs of sound ideas which require development; and it is often the best way to expose a troublesome folly to get it thoroughly talked out. It must not be forgotten that statesmanship includes not merely the getting hold of the right policy on all sorts of subjects, but the education of the public mind, so that it may appreciate and go along with what is proposed. In such a country as ours it is scarcely possible that a measure could be passed without the general assent of the public; but it is necessary that the people should not merely assent to, but should thoroughly understand, what is going to be done. Any one who looks back over the career of the late Government can hardly fail to discover that one times of their early successes and of their subsequent distribute was simply that in the first instance, they cannot a ripe public

cpinion along with them, whereas in the next stage they were dealing with subjects which few people had had time to think about and to comprehend in all their bearings. Even if the Ministry knew their own mind on these subjects, which may perhaps be doubted, it is quite certain that the country did not. The scoret of the Irish University Bill, for example, was guarded so jealously and closely up to the moment of Mr. Gladstone's speech that it fell upon minds for the most part quite unprepared to receive it, and the favourable impression which was produced by a plausible statement disappeared the instant the hard clauses of the Bill were seen. It is possible that, if Mr. Gladstone and his colleagues had taken a little pains to instruct opinion as to the actual conditions of the problem, their proposal would have obtained more careful consideration. Under the government of a beneficent despot, all that is required is that the despot should decree the right thing to be done, and see that it is done without delay. In a free country, where the people are associated with their rulers in determining the course to be pursued, and where, even after an Act is passed, its satisfactory operation depends very greatly on the temper in which it is received, it is necessary to make sure in the case of any important legislation that there is a sufficient body of matured opinion to give new measures a fair chance.

It was probably on this ground that the Government stermined to refer the questions relating to the Master and Servant Act, the Criminal Law Amendment Act, and the Law of Conspiracy to a Royal Commission. mistake has perhaps been committed, but, as it is a generous one, it may be forgiven. The Government has perhaps been indiscreet, according to the calculations of worldly prudence, in proposing this concession without waiting to be asked for it. Human nature is for the most part so constituted that what is easily obtained is compressively little relucal and is according a constituted that comparatively little valued, and is sometimes even received with ungrateful suspicion. The so-called loaders of the working classes have reasons of their own for being alarmed at the prospect of an inquiry into the truth of their assertions and the extent to which they can be regarded as really representing the opinions of those for whom they assume to speak. It may be hoped, how-ever, that the great body of working-men, who have lately shown a disposition to think for themselves and to set aside the dictation of the self-appointed spokesmen, will, on reflection, be satisfied with the inquiry which is about to take place. The names of the Commissioners, including Chief Justice COCKBURN, Mr. Justice SMITH, and Mr. RUSSELL GUENEY, to supply the judicial element; Mr. T. HUGHES and Mr. MACDONALD, the President of the Miners' Association, representing the labouring class; and Lord WINMARLEIGH (Mr. WILSON-PATTEN), Mr. BOUVERIE, Mr. ROBBUCK, and Mr. GOLDNEY, as a sort of general jury, are a sufficient guarantee of the thoroughness and impartiality with which the inquiry will be conducted; and there can be no doubt that the subjects which they are to take in hand will receive careful investigation. been urged that everything that can be said about the matter has been said over and over again, and that what is wanted is not information, but legislation. No doubt there are some persons to whom the whole subject is perfectly clear, and who would be prepared to legislate upon it at once; but this is not the state of mind of the country generally. If it were only a question of general principles, there would be no reason for appointing a Commission: but it is mainly a question not of principles. ing a Commission; but it is mainly a question not of principles, but of facts, as, for instance, whether the present state of the law is really required by a tendency to commit the offences against which it is directed, and whether it operates in any respects harshly or aggressively. It is said that, if the Home Secretary wants to ascertain the opinion of workingmen, Mr. HENEY CROMPTON can tell him all he need care to know, and that the Federation of Employers may be consalted on the other which it is not the mere opinions of one side or the other which it is needfal to get at, but the broad facts as to the actual operation of the law; and this broad facts as to the actual operation of the law; and this can only be ascertained, not by consulting prejudiced advocates on either side, but by sifting cases, taking the evidence of persons who have had experience of the working of the laws, and so getting at the facts of the matter. It is very easy to argue in a broad, general way about such questions, but there are, we anspect, very few people who know at this moment how the law which has been attacked really operates. It will be time enough to legislate when this has been ascertained in an analysis and the state of the laws are assertanced.

W ...

thentic and authoritative manner, and a few months for this object can well be spared. There is nothing surprising in the disinclination of the Trade Unionist leaders to have their system examined. Nething could be more significant than the fact that the part of the Trade-Union Act of 1871 which provides for the publication of the rules and accounts of each Society has remained almost a dead letter. The Unions would obtain certain advantages through registration, but this would involve the publication of their rules, and, whatever may be their reasons, they prefer that their rules should not be known.

CONSERVATISM AND SCEPTICISM.

TT is generally assumed, and with good enough reason so far as The generally assumed, and with good enough reason so far as the actual condition of politics is concerned, that conservation and scepticism are antagonistic forces. The belief is doubtless well founded that the existing social and political order is intimately connected with the established faith, and that to attack one is therefore more or less directly to attack the other. We generally find that a religious aceptic is inclined to be a political Radical; and though we may occasionally find such hybrids as a Conservative infidel or an orthodox revolutionist, we regard them as acceptional and presume that such a combination of them as exceptional, and presume that such a combination of opinions implies a logical infirmity in the mind where it exists. Not many persons, it may be, have framed a perfectly cohorent system of opinions, and deduce all their political and religious theories from a few deep-laid first principles common to both spheres of speculation. But there is an instinctive intellectual system. spheres of speculation. But there is an instinctive intellectual sympathy which outruns the logical process. There is an affinity between dogmas which is felt even where its ground is not consciously recognized. It may, however, be displited whether the antipathy between conservation and scepticism is really so irreconcilable as we sometimes assume. The old English Free-thinkers were generally Whigs, as the French materialists at the end of the last century were naturally revolutionists. But they had a superficial reason for this connexion of opinions which was sufficient by itself. So long as the State professed to interfere, however mildly, with the free expression of thought, people who attacked the accepted dogmas were forced also to attack the State. When disbelief in the doctrine of the Trinity was punishable by law, Unitarians were forced to resist a power to which they might perhaps not object on principle. Meanwhile a good many thinkers, for whom the danger of persecution was practically imperceptible, were at once conservatives in politics and destructives in religion. The most conspicuous of all the English sceptics belonged to this class. Bolingbroke's hatred of theologians did not prevent him Bolingbroke's hatred of theologians did not prevent him from leading the Tories; Hume, the most thoroughgoing of sceptics, was as conservative in his politics as Johnson; and Gibbon, the most elaborate assailant of Christianity upon historical Gibbon, the most elaborate assailant of Christianity upon historical grounds, gave a steady vote to the Tory Government, and was one of the few men of intelligence who thoroughly approved the measures against America. Such men, in spite of their ability, were doubtless short-sighted; and they were quite wrong in supposing that they could attack the established religion which they hated without injuring the political order to which they were attached. Everybody can now see plainly enough the natural consequences of such a policy. And yet there was nothing directly inconsistent in the view which they took. We use the word scepticism very loosely; and frequently call a man sceptical not only when he is in a state of doubt, but when he holds a set of opinions irreconcilable with our own. Scepticism in the stricter sense may be naturally connected with one variety of conservatism. Horace Walpole, who was a Voltairian so far as he had any opinions, gives the theory very clearly. If, he says, he had been in the place of Luther—a tolerably wild hypothesis—he would have required a very clear revolation from Heaven before he had preached Luther's doctrines. And his reason is, in its way, a very good one. It was not quite clear, he says, that the doctrines were true, whereas it was perfectly clear that to preach them would involve the loss of innumerable lives. If, indeed, Lather could have distinctly foreseen all the massacres, persecutions, and all income a supplied of the property of the says, that the doctrines were true, whereas it was perfectly clear that to preach them would involve the loss of innumerable lives. If, indeed, Lather could have distinctly foreseen all the massacres, persecutions, and and all income and a supplied from the Medoward time to must be would involve the loss of innumerable lives. If, indeed, Lather could have distinctly foreseen all the massacres, persecutions, and religious wars which resulted from the Reformation, it must be granted that a very strong conviction of duty or a very feeble sympathy with human suffering would have been required to make him pronounce the signal for strife. A Walpole-Luther—a man, that is, who disbelieved in the Pope but did not believe very much more in anybody else—would naturally, perhaps we may say rightly, have held his tongue. The conviction, in fact, that truth is unattainable, or is not canable of communication may say rightly, have held his tongue. The convection, in lact, that truth is unattainable, or is not capable of communication to the bulk of mankind, is not calculated to make reformers. It must generate a conservatism, not of the highest kind indeed, but of that kind which consists in letting sleeping dogs lie as long and as quietly as possible. If the world is enveloped in impenetrable mist, and the ablest man differs from the fools only in seeing that what they take for firm land is nothing but an unsubstantial fog-bank, his best wisdom must clearly be inaction. If any institubank, his best wisdom must elerry be maction. It any institution is standing, that is a reason for not upsetting it; at least, it keeps pickpockets at bay, and enables philosophers to drew their sents and keep their studies unburnt. The prejudices which support it may be more prejudices, but there is no chance that in this world, where everything is a puzzle and the puzzle become; more kepsless the longer it is studied, we shall ever get any better apport. If truth is unattainable, one groundless prejudies is pretty nearly as good as another, and all attempts at revolution are merely so much trouble thrown away. When you are in such a quick-sand, it is best to be quiet. At the cost of a great effort you may possibly make a plunge to what you take for the bank; but the philosopher knows that you will be in the same quicksand still. The inconsistency of such men as Hume was not that they were conservatives by propensity, but that they could not hold their peace when they held that nothing was to be got by speaking; or rather, their error lay in the opinion that any institution could permanently survive the open admission that it has no real meaning. Systematic acepticism is not a state in which the ordinary human mind can maintain itself; and therefore the ideal of the Humes and Walpoles, a state of things in which everybody should agree to do nothing, because admitting that they could know nothing, was simply unattainable. port. If truth is unattainable, one groundless prejudice is pretty

was simply unattainable.

What is generally meant by scepticism is something very different from this; and, as is frequently pointed out, it is quite consistent with, if it does not necessarily imply, dogmatism. It is not an assertion that a man should be in a state of permanent incapacity to make up his mind about certain subjects, but a percuptory on that he ought to come to very definite conclusions about The convictions which it favours may indeed be of the assertion that he ought to come to very definite conclusions about them. The convictions which it favours may indeed be of the negative kind; but they are not the less imperative. The sceptic of this variety warns the human intellect off certain provinces of speculation, and declares that a sufficient rule of life may be constructed without reference to them. Whether wrong or right, his doctrines are intended to lead to action as distinctly as the doctrines which he attacks, and are as capable of dogmatic assertion. The two statements, "I have no opinion whatever upon such or such subjects," and "I positively assert that nobody has any right to any opinion upon them," coincide, so far as the latter implies the former; but one may stimulate while the other necessarily paralyses. Scepticism of this last variety passes into fanaticism just as easily as the dogmatism of which it is the antithesis. The conviction that the Pope is an impostor may produce energetic action as easily as the conviction that he is infallible. The true sceptic would be unable to say whether the Pope was or was not an impostor, and would infer that his power had better be maintained within its existing limits and not introduced outside of them. Which state of mind is right must, of course, depend on the particular opinion in question.

There are matters on which overybody must be sceptical, because they are admitted to lie beyond the limits of human thought; there are others on which people ought to be degnatic, so far as that word merely implies a clear conviction, because the truth has been established on evidence sufficient to satisfy any external inquirer. In the ordinary sense of the word, however, a sceptic is a man who takes the negative of the doctrines generally accepted in a given time and place, and is therefore presumably inclined to a revolutionary view of things in general.

The vagueness with which such words are used, especially for

purposes of mutual recrimination, has led to some very random purposes of mutual recrimination, has led to some very random criticians upon many subjects. It is, for example, not unconfunnly said that scepticism is destructive in art as in politics. In third sense, there is probably much truth in the doctrine, though there are some obvious exceptions. The poetry of scepticism, it is suggested, must necessarily be feeble. The doctrine will generally hold good for the kind of scepticism which allies itself with conservatism. A man who holds with Gibbon's philosophy that all religions are equally fulse must generally be a man of frigid temperament. No man of strong sympathies and passions—that is to say, nobody who has the first qualification for susceptibility to poetical impulses—will easily reconcile himself to look upon all opinions with impartial contempt. A mind so delicately balanced that it can permanently remain in the state of doubt from which that it can permanently remain in the state of doubt from which Descartes professed to start must have a singular capacity for taking things quietly. There is, indeed, a poetry of pure scepticism, but it implies that rare combination of qualities which is typitled by Hamlet. A man may have strong feelings about the world, and yet have a constitutional incapacity for making up his mind to accept any decided theory. His scepticism is the result, not of a frigid temperament, but of an over-refining intellect; and, in such a case, his doubts may become a terture and express themselves in poetry which certainly need not be shallow, though we may not approve its tendency. It expresses the emotions of a thinker who is unlucky onough to symmathize in turn with all sides of overy question, not onough to sympathize in turn with all sides of every question, not of one who is equally indifferent to all. Hamlets, however, are an exceedingly rare commodity in the world, and their rarity is hardly to be regretted from the moralist's point of view. One can have being conceive a man who shared Hume's philosophical views being conceive a man who shared Hume's philosophical views being capable of genuine poetry. Such a man guards himself instinctively against the poetical emotions because he feels that they are dangerous in the highest degree to the preservation of a complete neutrality. But, on the other hand, a poet like Shelley was a capite in a very different sense, and, it may be said, a sceptic by accident. He had thrown everboard all the religious dogmas of his time; but his emancipation had not the least tendency to make him distrustful of his own infallibility. He rejected creeds as emphatically as the most crabbdox could affirm them; and though the number of acticles in his own creed was very limited, he was quite as ready formated. His poetry, therefore, might suffer from the colourless themselved his destripes—as, in first, one always feels after reading him the kind of giddiness caused by a stay in a highly rarefied

atmosphere; but his doubts did not tend to paralyze his sympathies, and to encourage intellectual or moral indifference. And therefore, though we seel that there is semething manufactuatial and even radically unpoetical about the abstract theories which supply in him the place of a creed, his fervid imagination finds sufficient scope for the production of exquisite poetry. However flinsy and unsatisfactory the temple in which he worshipped, the hymns which he raises are not chilled by any doubts so to the worthiness of the object. We feel that if Shelley had been brought up under different conditions, he might have become an obedient follower of Southey, and have denounced the ferocity and materialism of the worst class of revolutionists quite as vigorously as he fell upon kings and priests. upon kings and pricets.

Dogmatism, in short, in the sense of resolute adherence to one set of opinions, may be as easily on the conservative as on the destructive side; and it is often a mere accident whether it puts on the external form of revolt against established doctrines or of destructive side; and it is often a more accident whether it puts on the external form of revolt against established doctrines or adherence to them; and whether, therefore, it goes by the name of scepticism or obstructiveness. Pure scepticism ought properly to be conservative, although it is a very dangerous ally. It might be a curious, but it would be rather a dangerous, question to ask how often it is to be found passing itself off for sound faith in the most respectable clothing. In this queer masquerade of life it is perhaps better not always to look too closely into things, or to inquire how often we might find a would-be Popo in the guise of a red-hot Radical, or the reverse and perhaps less respectable phenomenon. It is dangerous to lay down any confident rules, in a world so little governed by logic, as to the camps in which people may accidentally find themselves. Nobody, it is probable, would be more surprised than the persons themselves, if the trustendencies of every man's opinions were suddenly revealed to him. Our supposed allies would often prove to be ensmies in diaguise, and our enemies to be unconsciously playing into our hands. Mr. Mill pointed out to the Conservatives in the most epigrammatic of his speeches that they should not consider it an insult if the great force of human stupidity were reckoned as on their side of the question. Perhaps he himself was not entirely without support from the same element; and, in the same way, dogmatism and scepticism play strange pranks, and are often to be discovered where they would be least welcome if openly avowed.

SEAMEN AND OTHERS ON THEIR TRAVELS.

WHEN a boy of adventurous tastes and an inquiring turn of mind takes it into his head that he must see the world, he is pretty safe to decide upon going to sea. If his parents and guardiens are amenable to reason, and dutifully consent to the gratification of his wishes, so much the better; if not, and if he has the makings of a man in him, he runs away. Such at least used to be the regular course of things in the nautical romances and dramas of an earlier school, when the author was in want of a dushing hero-privateersman, buccaneer, or seamen in Her Majesty's service. Such we believe to be still not unfrequently the course of things in actual life, and we fancy that the flower of the men in the Royal and mercantile marine, the pick of the English engineers and stokers who are looking after engine free from the Poles to the Tropics, have been moved by their restless the men in the Royal and mercantile marine, the pick of the English enrineers and stokers who are looking after engine fires from the Poles to the Tropics, have been moved by their restless spirits to betake themselves to the professions they adorn. How far they find their hopes realized must always be matter of individual opinion; and whether or not their choice really repays them must be very much a question of temperament and intelligence. In one sense sailors certainly see a very great deal; in another sense they see next to nothing at all. It is true that they have constant change of scene and climate, if that is enough to content them. On one voyage they are running over troubled and turbid waters into masses of dense grey fog, while a rapidly falling thermometer indicates the close propinquity of icebergs. On the next they may be becaused on a transparent sea of glittering steel under a sky of staring blue, in which the sun is glowing like a fire-ball. They may even enjoy the excitement of a shifting panorama of distant coast-lines, or be gratified by a faint series of dissolving views at each successive headland which they pass in the day-time. Now and again, after long weeks or months at sea, they are brought to an anchor or moored to a quay in front of some strangling anylomeration of buildings. Occasionally they disembark among such a cosmopolitan population as you may see everywhere from Livaspool to Hong Kong; and perhaps they may be congratulated on having iulfilled their dectiny very much to their own satisfaction. But if they held, is spite of experience, to their early idea of "seeing the world," we can exceed in agine a more exasperating existence than theirs. For they are continually skirting the fringes of life; coasting a land of promise on which they are seldom suffared to set foot; while they are perpetually having their curiosity piqued by tantalizing glimpace of the masses are quite sufficient to extend the representation of the self-th masses are quite sufficient to extend the readers

sterns prisoners who issuested the familiar is while the people of Peris demolished the east of twenty the ancient mariners who navigated the world by instalments might the torquis estille. In mines we repeatedly discumnavigated the world by instalments might part the information they have accumulated almost as terrely the old Indian General immortalized in the memoir prefixed to the Ingelsky Legends, who condensed his impressions of every-thing—econory, suttee, the caves of Elephanta, &c.—into the curt monosyllable "hot," prefaced by qualifying adjectives of various of intensity.

in the most out-of-the-way of seaports that make any pretensions to a speciality in the way of export trade you are as likely as not to come across a British seaman. You may be wandering at the back of the world, possibly in South America, like the

lost heir of the Tichbornes, and in the course of your perambula-tions somewhere between the Cordilleras and the sea you arrive at

tions somewhere between the Cordilleras and the sea you arrive at a resting-place considerable enough to figure in capital letters in the school maps. Seen in the reality, it seems a heaven-abandoned spot emough, and the last place in the world likely to be visited by Englishmen. There is a curving line of storm-tessed breakers which must often swell into an impracticable hearier of surf; a strip of shelving beach to correspond, and a confused jumble of whitewashed, flat-roofed hovels which collapse periodically under earthquakes and tornadoes; while, towering behind the whole, there smoulders a burning mountain. But on making some causal inquiries of your impreparation.

towering behind the whole, there amoulders a burning mountain. But on making some casual inquiries of your innkeeper, you learn to your surprise that the British Government has subsidized a Vice-Consul, for the town does a considerable trade. It appears that there are mines in the mountains and some guano islands in the offing, while tons upon tons of rails and railway plant are being landed for a line in course of construction. So, if your necessities, pecuniary or other, should take you to the Vice-Consul's you are pretty sure to run up against some broad-shouldered countryman, whose fresh-coloured face contrasts agreeably with

countryman, whose fresh-coloured face contrasts agreeably with the sallow features of the mongrol official who bows and scrapes to you. There is no mistaking either the Englishman's nationality or his occupation. He has brought his sturdy sea legs ashore with him, and rolls cheerily across the bleak white-washed little den when it is a question of a comparison of documents or setting his hand to a register. According to his social standing as wearned to a register. According to his social standing, as measured roughly by the tonnage and cargo of his vessel, he may be attired in a frock-coat and flowered satin waiscoat, or may be made all snug in a fur cap and a close-reefed pea-jacket. In any case his

snug in a fur cap and a close-reefed pea-jacket. In any case his dress infallibly shows his supreme contempt for the climate, for the chances of a sunstroke, and for the fashions adopted by the natives. He eschews ginghams and flimsy cottons, although the thermometer may be standing at anything you please, while the rarified air is like the breath of a blast furnace. He scorns to avail himself of those scanty strips of shade in which the seasoned inhabitants delight. His business despatched with Her Majesty's representative, he is sorely put to it to kill the time; but, as the speculative citizen is sure to have provided him with a house of call. Thirsty of course he is, and small blame to him: and "par-

call. Thirsty of course he is, and small blame to him; and "partaking of refreshments" is at all times an unfailing resource. But he has no opinion of the drinks of the tropics, although he may have

been persuaded to try them from motives of curiosity. He did once taste sangaree in the West Indies and pulque at Vera Cruz. Here he gulps down his rum and water, although his blood is simmering already, and abominably fiery the mixture is. No doubt many of his countrymen, in very different spheres of society and far more liberally educated, would carry their English likings about with them, just as he does. Do we not know how Indian officers swear by brandy as a wholesome stimulant, and do but the garrisons on the blazing Rock of Gibraltar swallow butts of ourning sheary in midsummer?

sherry in midsummer?

anwhile the opportunities which our bored mariner is missing would stir the envy of many a member of the Scientific Societies. To say nothing of the botanizing to be done in the depths of some of the valleys, and the geology and rich mineralogy of the neighbouring sierra, hard by is one of the most famous Auacas in all South America, teening with the secrets of Prus-Inca civilization, and many of them to be got at by merely disturbing the soil. It is an extravagant supposition, of course, that our friend under any circumstances should go in for the archeological or physical researches which would have tempted a Prescott or a Humboldt to take a forecastle passage tempted a Prescott or a Humboldt to take a forecastle passage in his ship. But even in the greater cities with numerous attractions which are much more in his way, he leads the same self-contained life. He prolongs his stay ashore in them because he finds more pretentious establishments arranged expressly for his accommodation, where there is an agreeable society of gentlemen of his own class. In the little town under the Cordillaras the entertainment provided began and ended with the spirit-bottle. He had to pass the time in solitary drinking, unless he brought his first officer with him for company, nor was there a pipe or a screw of tobasco to be had for love or for money. In cities like Rio de Jameiro, Calho, or Vera Oren, there are marine boundings. of tobases to be had for love or for money. In cities like Rio de Janeiro, Callas, or Vera Oran, there are marine bourding houses that are patronized absent emiriely by merchant captains and arganizations and the shipping clashes of the houses with which they some into contact. You can not only have "nest spirits," but bitter ale and Guinness's stout, caused bear and pungent packles, churchwarden pipes, and the chickent of Reistol birdseys. These boarding-houses are the last plains in the city that the ordinary transfer is likely to be recommended to, for, if you have not come off a long sen-veyage, you less your liking for these likelish.

luxuries in the enervating atmosphers of the terre calcate. But to the hearty, healthy, sociable miles for whom they are intended they offer all that is most dealrable. The guests strip to their shirts and pantalooms, and dine, drink, and smoke in their shirt-sleeves. They exchange the old familiar talk that passes current like well-used coin without losing perceptibly in the process, and they have little inducement to quit such good company. For of course they know nothing of the language, and next to nothing of the country or people. The scenery may be benutiful, and indeed they have surmined as much after taking a good stare at the beach through their telescopes; but they have never thought of getting a nearer view of it. So they sit on in the clouds of tobacco smoke in stifting hilliardrooms, instead of refreshing themselves in the balmy breeze of the rooms, instead of refreshing themselves in the balmy breeze of the rooms, instead of refreshing themselves in the balmy breeze of the evening with the beauties of the tropical gardens that girdle the city. As for brightening themselves and their ideas by mixing with the crowd of pleasure-scekers, they may go once in a way into the fashionable streats to have a good stars at the shop-windows, and to make some purchases to carry home for souvening. But the streets are very little to their taste; the inhabitants return their staring with interest; they strongly suspect that the shopkeopers swindle them first and mock them afterwards. Consequently they have fellen hash on the same religenity of Consequently they have fallen back on the sage philosophy of making the most of antheoments which they know are congenial to them. So it comes about that the class cultivate a habit of apathy which has become a tradition with them. Exceptions there are; but, as a rule, it is a point of honour with them to show a polite indifference to all objects and considerations that are a panel indifference to an objects and consideration that it foreign to scafaring matters, and many a man has coasted the grandest scenery and the most interesting historical sights on the scaboard of the globe, without having acquired a single definite idea except as to the precise localities of lighthouses.

It is all very natural. If boys is a comparatively humble condition of life are caught early and shipped for sea, they can hardly be expected to develop any enthusiastic appreciation of the sublime and beautiful, or to have cultivated any regard for the sanctity of the hallowed associations in the world's history. When weathering the Horn, you think rather of the storms of wind when weathering the Horn, you think rather of the storms of which and hail that come sweeping down upon you than of the platureque mountain-tops round which they gather. Or, to come nearer home, a skipper navigating among the Isles of Greece, or working up "the Arches" past the plains of Humer. But do the ordinary run of our English tourists behave very differently, although next of them have been educated at arcaliant schools and many most of them have been educated at excellent schools, and many of them have finished at the Universities? If they start on a summer tour up the Rhine and round by Switzerland, they herd with cockneys in British caravassersis, shuaning all foreigners as if they were plague-stricken. They sit down to mean easif they were plague-stricken. They sit down to mean each the cliffs and the castles. Or, if they go south for a winter in Rome, how much time do they devote to its history, art, and archaeology? We are no advocates for cramming so many churches down against the grain in the course of a busy and missepent day; or for recling off coloured canvasses by the ell because they are labelled with the names of distinguished paintars. But we think it is noting to the opposite extreme when grathemen live in most of them have been educated at excellent schools, and many think it is going to the opposite extreme when gentlemen live in the Eternal City precisely as they might do at Brighton ov Houlogne; when they devote their mornings to exercise back and a run with the hounds in the midst of a plurality of foxes; when they sit down of an afternoon to a rubber, if they do not feel equal to a stroll round the billiard-table; finishing with a dance that sends them to bed at the small hours of the mora-ing. We can forgive a man a good deal of idling if he only shows ing. We can forgive a man a good deal of idling it he only shows from time to time a refined consciousness of his privileges, and exhibits a graceful sense of contrition, occasionally rising to remorse. But we confess we have no kind of toleration for the man who takes a pride in closing his eyes, and makes a blind dash after the phantom he calls pleasure through the thousand attractions for which less favoured mortals are sighing.

THE ANGELIC DOCTOR.

A N obscure paragraph in some of the daily papers, which may easily have escaped the notice of our readers, announced the other day that the sexcentenary of St. Thomas Aquinas had been observed, with a "triduo" of services and sermons, at the Roman Catholic monastery of Woodchester, in Gloucestershire. It is in Catholic monastery of Woodchester, in Cloucesterabile. It is in fact just six bundred years since, at the early age of forty-eight, the "Angelic Doctor" rested from his life-long toils; and, little as his name may be familiar to the general public, it recalls an example and a period of intellectual energy which deserve, for many reasons, not to be forgotten or ignored. The time has passed by—thanks in great measure to the labours of German scholars of various schools of thought—when it was the fashion to scholars of various schools of thought—when it was the fashion to pooh-pooh the schoolmen as a more tribe of bigots or triflers. Nor will any competent critic be found at the present day to endorse the less extreme judgment of the brilliant, but not always exact, historian of Latin Christianity, who tells us that amazing as are the monuments of scholastic learning, "the sole seminant to posterity is that barren amazement." A writer so little than to any policylus or accludantical avenual bias as the late Mr. Mill open to any seligious or ecclesiastical sympathies as the late Mr. Mill hampronounced a far juster verdict, and a hotter judge of the question than either Dean Milman or Mr. Mill, the lamented Professor

Shirley of Oxford, is more ungradging and outspoken in his praise. He notes, indeed, what is obvious on the face of it, the scenningly impassable barrier, which separates the school lastic from all other literature; but he addadist the vast tenses of the schoolmen, not only bespeak an amount of literary toil rare in the most cultivased times, but also show a precision of thought and ability of logical analysis which may challenge comparison with the best works of the best ages of philosophy. And this is especially true of the second and greatest period of scholasticism to which Aquinas belongs. The volume by M. Haurfau, reviewed the other day in our columns, deals only with the earlier, and indeed mainly with what may be called the pre-scientific, period of mediaval theology intervening between the close of the patrictic and the opening of the scholasticism. It is true that three authors belonging to that earlier period, Peter Lombard, Gratian, and Peter Commetor, were long considered to form a complete theological library, and that it includes the lifetime of the acute but sophistical Abelard. But the thirteenth century is beyond all comparison the golden age of Scholasticism, though in the fourteenth it still had some conspicuous names to show, as, for instance, that of Duns Scotus. And of all the celebrities of that age, there is not one to compete—with St. Thomas Aquinas, "the angel of the schools." That thirteenth century was marked, not only in literature, but in every sphere of active or artistic development, by a surprising efflorescence of intellectual and moral energy throughout Europe. The age of St. Thomas, as Bareille has observed, was also the age of Innocent III., of St. Louis, of Albert the Grat, of Roger Hacon, Giotto, and Dante. It witnessed the birth, not only of the Summa Theologie, but of the Divina Commedia and Imitatio Christi, and in architecture of the cathedrals of Cologne and Amiens, and the Sainte Chapelle. In that century the Universities of Oxford and Paris and the two great Orders

commanding genius in the most opposite quarters.

Thomas was born in 1227, according to the most generally received reckoning, but whether at Aquino, Belcastro, or Rocca Secca, is still disputed. He was of noble blood on the side of both parents, nephew disputed. He was of noble blood on the side of both parents, nephew of Frederick Barbarossa and Henry IV., and cousin of Frederick II., and connected with the Royal Houses of Aragon, Sicily, and France. As with other men who afterwards became illustrious, various traditions surround the childhood of the future Saint. Before his birth a Dominican friar is said to have appeared to his mother Theodora, and told her that, though her child would be sent to Monte Cassino, in the hope of his obtaining the abbacy of that wealthy establishment, he would in fact become a brother and shining light of the Order of Preachers. What is more certain is that, when one of his infant sisters was sleeping by his side, she was struck dead by lightning while the boy remained uninjured in his nurse's arms. At five years old he was placed at Monte Cassino, then the most famous school of letters in Italy, and it is recorded that even then his constant question to his teachers was "What is God?" Later on he was sent to the University of Naples, where both the new Orders of Franciscans and Dominicans Naples, where both the new Orders of Franciscans and Dominicans held theological chairs. Thomas attached himself to the latter, and at the age of sixteen asked to receive the habit of St. Dominic. Ilis mother was furious. She followed him first to Naples, and then to Rome, and when the Dominicans sent him to Paris, she had him waylaid on the road, and for more than two years his relations kept him in continement, and sought by years his relations kept him in confinement, and sought by every device of violence and seduction to withdraw him from his purpose. At last the Pope (Innocent IV.), and, at his instance, the Emperor, interfered, and the young novice was eventually allowed to return to his convent. The General of the Dominicans then took him first to Paris, and thence to Cologne, to study under Albert the Great. His biographers relate how, when approaching Paris, his companion asked him what he would give to be the king of that fair city, to which Thomas replied, "I had rather have St. Chrysostom's treatise on St. Matthew than be king of all France." Albert, who was some thirty years older than Thomas, stands perhaps next to him among contemporary writers, though at a long interval. Like others, he at first thought his pupil dull and deficient, and at Cologne the future theologian got the sobriquet of Bos Siculus, but on better acquaintance his master exclaimed, "The youth Cologne the future theologian got the sobriquet of Bos Siculus, but on better acquaintance his master exclaimed, "The youth whom we call Dumb Ox will one day make the world resound with his bellowing." And accordingly at twenty-two he was appointed Second Professor and Master of Students under Albert, and at that early age he composed his two first works, De Ente et Essentid and De Frincipies Natura. Nor was he a mere student and recluse. We are told that, when he was preaching on the Passion in Lent, the whole congregation burst into a passion of tears, and at a later period, when Urban IV. sent him to preach in the cities of Italy, the churches could not hold the modifications who flowed to hear him. And from all parts of Essentials, professors, months—asking his advice or solution of their biddicies. Some likes of the axisant of his literary behous may

be formed from the fact that his Commentary on Greec alone fills over 1,250 pages of the large quitte adition printed in double columns. And the lucid style and arisagement of his works contrast remarkably with those of the tarties schoolmen. At the age of thirty he had attained the senith of his ignorer and fame. In 1257 her took his doctor's degree at Paris, and in the same year composed his Summa Contra Gentiles, discussing the principles of natural and revealed religion, the digin and nature of evil, the salsehood of pantheism, the relations of reason and faith, and the existence of God. The philosophical form of the dogma of Transubstantiation, which had been defined shortly before his birth at the Fourth Lateran Council, was by general consent referred to him for decision and determined, in a Realistic sense, by his writings. It was at his suggestion that Urban IV. in 1254 instituted the festival of Corpus Christi, and the office for the feast, still preserved in the Roman Breviary, including the well known sacramental hymns Pange lingua and Verbum Supernum prodiens, is his composition, as also the Landa Sion, familiarized by Mendelssohn's music to modern ears. Urban was less fortunate in employing the services of the great theologian for the reconciliation of the Greek and Latin Churches, for his treatise Contra Errores Gracorum was entirely based on forged authorities, by which he as well as the Pope was deceived.

It was in 1265, at the ripe age of thirty-eight, that Thomas began his principal work, the Summa Theologia, which was left unfinished at his death. This is not the place to enter on a criticism of the great masterpiece of scholastic genius, nor can we do more than briefly indicate its contents. It comprises a complete aystem of natural and revealed theology, regarded both in its divine and human aspects. In the first part the author treats of God and the Creation. In the second part, which may be compared with the *Ethics* of Aristotle, and which is perhaps the most valuable as it is certainly the most original portion of the work, the whole theory of human nature and action is discussed, the passions the behirs of ristnessed and their relations to the passions the behirs of ristnessed and their relations to the second part. sions, the habits of virtue and vice, and their relation to happiness as the final end of life, as also the theological virtues and moral law. The third part expounds the plan of redemption both on its objective and subjective side. Under this last head we are brought eventually to the doctrine of the seven sacraments, as the application of redeeming grace to the soul; and here, in the treatment of the fourth sacrament, of penance, the work was interrupted by the author's premature death. It was while writing this last article that he is said to have heard the approving voice from the crucifix, Bene de Me scripsisti, Thoma, quam ergo mercedem accipies? to which he replied, Non aliam, Domine, nisi Teipsum. At the Council of Trent the Summa was placed on a table in the midst by the side of the Scriptures and the decrees of Councils and Popes. In 1274 Gregory X. convoked the Second Council of Lyons with the view of reuniting the Greek and Latin Churches, and issued a special Bull directing Thomas to attend it. He prepared to obey the summons, but although he was still in the He prepared to obey the summons, but although he was still in the prime of manhood, his earthly work was done. Incessant mental toil had worn out what was never a robust frame, and at the Bonedictine Abbey of Fossa Nuova his journey was stayed. There, after a few days' illness, he died on the 7th of March, 1274, and was buried in the conventual church. Nearly a century afterwards his body was carried to Toulouse, where it still rests. John XXII. had already canonized him. Titles of courtesy or honour, albeit endorsed by the sanction of a Papal Bull, do not always commend themselves to the indement of the outer world, but no one who is themselves to the judgment of the outer world, but no one who is even moderately acquainted with his unselfish character, blameless life, and splendid intellectual achievements, will grudge the Angelic Doctor the distinction awarded him by the reverence of six centuries. On the value of his philosophical and theological speculawas accepted on all sides as axiomatic has been superseded by the wider knowledge and more searching criticism of a later age. The same might of course be said of Aristotle or Plato, and the name of Aquinas is not unworthy to be placed beside theirs. Of all the lover line of Spints and doctors who forms in the Roman Calendae. long line of Saints and doctors who figure in the Roman Calendar, and whose various claims on the devotion of the faithful are set forth in elaborate detail in the gigantic series of Hollandist biographies, there is none who has more nobly earned his place in the catalogue. We can hardly be surprised to find Bucer declaring that "but for Thomas he could overthrow the Church of Rome," and Dante assigning him so high and exceptional a position in Paradise, above the reach of praise.

WOMEN'S WORK.

In a letter which appeared a few days ago in the Times Miss. Faithfull tells a story which has a melancholy moral. One of the men who advertise "home work" for ladies was detected by one of his victims, and received the punishment which he deserved. The case shows that a living may be made out of the natural desire of women to add to their means without going from home. There is certainly nothing surprising in the fact, when we think how great is the number of unemployed and half-supployed women who are urgently in need of a little addition to their incomes, and who have a natural aversion to leaving their families. We cannot wonder at the result. Everybody has known good widows left with children on their known, and with just means enough to-less them out of the workhous. They have be strongle desparately and painfully to proved the breaking up of their little

households, and gradually leave the melous arts by which a pittance may be priorited from the compassion of strengers or the
languid good will of substicies. Realiting can be more patients, or
more deserving of sympathy, thin, such asses. Very likely there,
has been no gross sublack of prindential confiderations. The interes
sity of the suffering shows that there is still a spirit of independence.
If the suffering shows that there is still a spirit of independence.
If the suffering shows that there is still a spirit of independence.
If the suffering is not consent to abandon their daties, they slight
find a refuge in the workhouse, or in some charitable institutions.
The sternest political economists may admit that in such cases a
little help might be judiciously administered, which should
prevent, instead of encouraging, demoralization. It would of
course be a most desirable thing to enable such sufferers to help
themselves; and home work, if it were a possibility, would supply
the want. A woman may have plenty of leisure at home, who yet
cannot leave her home for the day without depriving her family of cannot leave her home for the day without depriving her family of essential services. Such cases make it perfectly natural that there should be an urgent demand for home work; and, as we see, the demand is strong enough to be turned to account by impostors. Miss Faithfull, however, tells us, and she speaks with considerable authority, that home work is scarcely to be had. She says that "pride and prejudice," besides want of capital, prevent ladies from seeking employment, except by secret means; and she apparently infers that these bad qualities ought to be discouraged as much as

In one sense, of course, we must agree with her without reserve. If ladies are really in want of work, the pride which prevents them from making their wants known is a false pride, and is very likely to lead them into scrapes. There is nothing wrong in the endeavour of a lady to support herself or her family, and the sconer we get rid of the silly superstition which imputes any discredit to the practice, the better for everybody concerned. We confess, however, that, with all due respect for Miss Faithfull's means of information, we should not have supposed this mistaken pride to keep up appearances is, indeed, common enough and mischievous enough in English families: common enough and mischievous enough in English families; and doubtless encourages this as well as other evils. But our experience has also shown us that there are many women are only too anxious to make their wants known as ly as possible, who actually become a nuisance to their ds, and even to their friends' friends. Such women widely as friends, may, as we have suggested, have other reasons for desiring home work beyond the desire to keep the fact of their working secret. So long as it is considered to be a woman's province to attend to domestic duties there will be a natural desire to obtain home work. Not only widows with families, but daughters with incapable parents and elder sisters in large families, and women in many other relations in life, will be bound by strong and women in many other relations in file, will be bound by strong ties to their homes, and yet have spare time on their hands for work. Miss Faithfull, however, assures us that the demand cannot be supplied. "Work at home," she says, "is an impossibility unless a woman has some special gifts. Artists and authors are the only men who can do their work at home, and women must be subject to the same conditions." No doubt there is a good deal of truth in this remark, and it explains incidentally one rather painful phenomenon. The number of women who try to do some sort of literary work is enormous, and we fear that it must be increasing. A lady does not like to take in washing or needlework, and indeed is generally incapable of either of those employments. She is, however, generally capable of writing in the schoolmaster's sense of the word, and naturally infers that she is also capable of writing in the literary terms. in the literary sense. Shakspeare's trade, so far as it was observable from the outside, consisted in making a number of black marks upon white paper; and we have no doubt that many of his neighbours in Stratford-on-Avon considered that they of his neighbours in Stratford-on-Avon considered that they could perform that operation with equal facility. The opinion certainly seems to be prevalent amongst a large class of ladies, and the quantity of works published gives a faint indication of the result. If the public could be aware of the very small proportion which the published matter bears to the vast quantities of manuscript never destined to be translated into print, they would have a startling revelation of the strength of the feminine desire for employment. The supply in this case undoubtedly outruns the demand, and we must admit that it is manuscript never destined to be translated into print, they would have a startling revelation of the strength of the feminine desire for employment. The supply in this case undoubtedly outruns the demand, and we must admit that it is not very easy to suggest many other ways in which women can find profitable employment without more or less deserting the sphere of domestic duty. The question, indeed, deserves consideration by people who are anxious to improve the position of women, for there is no obvious reason why a good many subsidiary processes in many occupations abould not be more or less carried on at home. The tendency of modern times to collect all labour into great masses has many palpable evils; and though we may admit that it is partly due to inevitable changes, we should not be disposed to sit down without an effort as in the face of an inexorable necessity. We hold that, if women can only be employed at the price of materially weakening domestic ties, the fact would supply a very strong argument against many attempts, otherwise very commendable, to provide a greater variety of occupations for women. Reformers would be doing better service by pointing out methods of reconciling the two spheres of daty than any dognastically pronouncing them to be irreconcilable. The desire for work at home seems to be frequently legitimate, though it may sometimes also imply an excessive regard for appearances; and possibly it is within the limits of human ingenuity to discover means of partly supplying it. eens of partly supplying it. On another point, however, Miss Faithfull speaks with unde

some. She make out that women should shandon the "tirly intaining notion" that they can jump into amployment without previous training. Huminals of women, she talke as apply weak what they can do, they make a reply which residude and the formula supplyed by waiters at as brilingly British and. To the question, What can I have for dinner? The storacypyd reply in Whatever you please; under which must be understood the condition, So long as you are satisfied with chops or taisles. In like manner the hidies reply that they are ready for any supplyment, so long, that is, as the employment requires no knowledge and no skill. Any number of untrained women can be provided for any vacant posts; but it is very hard to find women who are litted to fill them. It would be presumptuous in us to question the accuracy of Miss Faithfull's statement that this theory of the inutility of previous training is a "truly feminine notion." And yet we are strongly inclined to suggest that it might with almost equal propriety be called a truly British notion. These it not, in fact, underlie a great many of our educational theories? We are slowly making a change in many departments of life, but it has still a wide popularity, and is even advocated as an elevating theory. People say, and rightly enough that it would be a content in the wide popularity, and is even advocated as an elevating theory. People say, and rightly enough, that it would be a great pity to substitute a merely technical training for a system tending to a general cultivation of the intellect. To this doctrine we fully adhere; but we must admit that it is very frequently applied in a sense which depreciates the value of all special training. We used to hold, for example, that it was the special glory of a British difficur that he was a gentleman before he was a soldier, and to infer that he ought not to be trained in professional knowledge. The ordinary British clergyman, again, learnt a certain quantity of Latin and Greek, and was then turned loose upon his parishioners and left to acquire such theological knowledge as he might fancy in the intervals of an active life. Barristers despised any instruction, with the ex-ception of training in the rule of thumb; and men of business are still inclined to regard all general knowledge as a distinct disadvantage in practice. If the only question lay between an education which had no reference to a man's duties in after life, and an education which never lifted him above the immediate hand-to-mouth application of empirical rules, there might be a difficulty in deciding which was the less mischievous. We venture to think that the two systems may in time be combined, and that he had the hard feather than the development of the combined and that the human faculties may be developed in such a way as to cultivate special aptitudes without neglecting the acquisition of knowledge of no immediately utilitarian advantage.

We are perfectly ready, however, to admit that feminine educawe are perfectly ready, however, to admit that lemmine seduca-tion has been at least as useless as masculine, and decidedly more frivolous. The wretched girls who are turned out of school with a scanty provision of so-called accomplishments are too often as ill-fitted for domestic life as for profitable employments. The evil is not confined to any one class. There is abundant room for improvement amongst the middle and lower classes as well as improvement amongst the middle and lower classes as well as improvement amongst the middle and lower classes as well as amongst the higher. Children are turned out from National Schools with a scanty provision of superficial knowledge which is as useless for any of the practical wants of their lives as the more showy knowledge in which their betters are drilled, or by which, to speak more accurately, they are varnished. Whether women are hereafter to find their most appropriate sphere of action at home or abroad, we have no doubt that they might be infinitely better fitted for either class of duties by a more sensible and thorough system of education. Thus, indeed, is a very assemble and thorough system of education. Thus, indeed, is a very assemble, and one which hardly anybody will be inclined to dispute. It may well be impressed upon us more strongly by such facts as those which Miss Faithfull mentions. Every year there are more women in want of employment, and it is to be hoped that in time we shall begin to think of fitting them for employment.

Meanwhile it is a fortunate circumstance that there is one kind

Meanwhile it is a fortunate circumstance that there is one kind of employment which it is proposed to throw open to women, and which, by general consent, needs no kind of education or training whatever. Indeed it has the peculiar merit that the less educated the person the greater the need of throwing it open to him or her. We refer, of course, to political life, in which it is difficult to say whether knowledge or ignorance gives the better qualification. If women show themselves capable of writing books and teaching schools, we are reminded that persons of such ability should be allowed to have as great an influence in the State as an ignorant voter. If, on the other hand, they show a tendency to take up the most violent and unreasoning lines of sgritation, and to pursue Meanwhile it is a fortunate circumstance that there is one kind the most violent and unreasoning lines of agitation, and to pursue them with the greatest indifference to argument, we are informed that the franchise is the best means of education; and that the degradation of a slave is the strongest reason for his emancipation. We fear that, in this case, it is not unlikely that the enfranchisement may precede the training; and as women are pronounced by their advocates to be incapable of all other employment by reason of their ignorance, it is some consolation to think that political employment will enable them to turn their abilities to good and wise purposes by its own efficacy.

THE BISHOPRIC OF BASEL.

WE were led a little time back through the ecclesiastical controversies in Germany to say somewhat about the history of the ecclesiastical divisions of that country, and to contrast their listory with that of the ecclesiastical divisions of England and of Phanes. We have now before us, in the Bundesblatt, Feuille

Fédérale, or official paper of the Swiss Confederation, the complete summary of the ecclesiastical controversies which have been going on since 1871 in the Swiss diocese of Basel. We must say that on since 1871 in the Swiss diocess of Basel. We must say that the official press is a little slow, as resolutions taken by the Federal Council on January 14th appear only in the Bundesblatt of March 7th. Still, better late than never, and it is a gain to get

March 7th. Still, better late than never, and it is a gain to get an official summary of disputes which we have heard about bit by bit for nearly three years. The whole controversy is very curious in itself, setting aside the present interest which it must have in the eyes of zealous partisans of either side. Those who are not in this way immediately interested may look on and see some attractive anomalies, historical, geographical, and constitutional, such as always suggest thought to those who study them.

First of all, let us remark that the present Bishopric of Basel has the least possible connexion with the ancient Bishopric which played its part in mediaval history, and which lasted, in a somewhat mutilated shape, down to the general smash of things. It is only by a figure of speech that Mgr. Engène Lachat, who has been deposed, rightfully or wrongfully, by a body called the Diocesan Conference, can be called the successor of Bishop Henry of Neufchâtel, who, when he heard that his enemy Rudolf was chosen King, called on God to sit firm on his throne, lest Rudolf should strive to climb thither also ("Sitze fest, Gott der Herr, sonst wird Rudolf auch bald deinen Thron besteigen"). There is of course the great difference between old and new Bishops in those parts generally; namely, that the old Bishops were temporal Princes, while the new ones are very far from being anything of the kind. And moreover the possession of a temporal principality by the ancient Bishops is not without its effect on the controversion which are new ones are very far from being anything of the kind. And moreover the possession of a temporal principality by the ancient Bishops is not without its effect on the controversios which are going on now. The old diocess of Basel, a diocess in the province of Besançon in the Kingdom of Burgundy, took in part of Elsass and part of what is now Switzerland, including of course the city which was the seat of the Bishopric. As usual, the Bishop was a temporal Prince within part of the territory subject to his spiritual jurisdiction. Before the Reformation he had lost all temporal authority in the city of Basel, which had become a free city and had joined itself to the Swiss Confederation. The Reformation deprived him of his spiritual authority in his former capital, and made him an exile from his cathedral church. But he still went on, both as Bishop and as Prince, in the small district known as the Bishopric of Basel, and of which we have lately heard a great deal by its new name of the which we have lately heard a great deal by its new name of the Bernese Jura. The Bishops of Basel were allies of the Swiss Confederation, and, when things were recast in 1814-15, their former principality became an actual part of the Federal territory. By the arrangements then made it became part of the Canton of Bern. Divided from Born by a mountain range, differing in language, differing in religion, having no historical associations in common with the Canton to which it was joined, the Bishopric of Basel was a most unnatural appendage to German and Protestant Bern. The district had formed a separate State; it was larger than several of the Cantons, and it should surely have been admitted into the Confederation as an independent member. But in the days of the Treaty of Vienua the notion of getting territors in compensation for other territory was still in men's minds, and as Bern had hopelessly lost Vaud, and as the Dishop of Basel was not to be set up again, Bern got his dominions to make up for the loss of Vaud. But it was not till \$23 that the new Bishopric of Basel was not up by a saving of Capaciting between the loss of Rome. was set up by a series of conventions between the See of Rome and the Cantons concerned. The new diocese was wholly Swiss, and took in the Cantons of Basel, Solothurn, Aargau, Thurgau, Jug, and Lazern. The greater part of the large district which formed the new diocese had never before had anything to do with Luzern and its renowned minster, had even been in another pro-vince, that of Mainz, as forming part of the diocese of Constanz, Solothurn was in the same province of Besancon, but in a different diocose, that of Lausanne. And as the chair of the restored Bishopric was placed in the minster of St. Ursus at Solothurn, which thus became, in all but giving his title, his cathedral church, it would seem that it was only the clinging to an old name for a new thing which hindered the newly founded prelate from being called Bishop of Solothurn, instead of Hishop of Basel.

This is the new diocese whose affairs have lately caused so much

This is the new diocese whose affairs have lately caused so much stir, and in which so strong a measure as the deposition of the Blahop has been taken by the body called the Diocesan Conference. This is a body very different from the voluntary assemblies which bear that name among ourselves, and consists of representatives of the Governments of the Cantons which have joined in the foundation of the Bishopric. This body, though the majority of its members are Protestants, has a voice in the appointment of the Bishop, and it is thence somewhat oddly argued that it must have the power of deposing him. Moreover, the appointment of the Bishop, and it is thence somewhat oddly argued that it must have the power of deposing him. Moreover, the Canton of Aargau has passed a law for the separation of Church and State, and has withdrawn itself from the diocese of Basel. This means, we conceive, that the State, as a State, no longer recognizes the Bishop as an official person, leaving the Catholic body in the Canton, as an unestablished sect, to recognize what it pleases. Lastly, there are the acts of the Bernese Government in the Jura, of which a good deal has been heard. Out of all these affairs a good number of appeals to the Federal Council have naturally arisen, and the summary of them forms a kind of ecclesiastical history of the Bishopric of Basel for the last three years. We will give a short elected of the chief points in them; but we will first act down two convictions of our own which have been strengthened by their stady. The one is that the old Bishopric of Basel ought never to have been made part of the Causen of Barn; the other is, that th

have been made part of the Cauten of Barn; the other is, that there was great wisdom in the primitive arrangement which made archail-astical and civil divisions always agree, and that there must always be great awkwardness when one acclesiation jurisdiction runs into the temporal jurisdiction of several independent States, whether those independent States be great Kingdoms or little Cantons.

It must be borne in mind through the whole matter that the Federal Constitution leaves strictly ecclesiastical questions to the Cantons. The Federal Constitution secures liberty of conscience; it guarantees freedom of worship, and forbids that my man, at all events any man of a recognized Christian confession, should be subject to any civil disqualification on the ground of his religion. But it haves to the Cantons to establish and to endow, to diseashfish and to disendow, at their good pleasure. The Federal power has no right to interfere in any ecclesiastical question, unless indeed the peace and security of the Confederation is threatened, or unless some act can be shown to have been done which involves a breach either of and security of the Confederation is threatened, or unless some act can be shown to have been done which involves a breach either of the Federal Constitution itself or of any of the cantonal constitutions which the Confederation has guaranteed. This almost amounts to saying that the Federal power cannot be made to interfere unless it chooses, and it is very plain that at this moment the Federal power has very little mind to interfere. We do not say that the Federal Council is disposed to treat its Cathelic appellants with injustice. But it containly seems disposed to make out to them. rederal Council is disposed to treat its Catheire appellants with injustice. But it certainly seems disposed to mete out to them only the strictest and most literal justice. "And one of its rulings might raise some curious questions. The relations between the Bishoprie of Basel and the Cantons which form its diocesse depend on certain conventions between those Cantons with one another and with the Pope, in the days before the present Constitution, made when the Cantons had the right of free diplomatic intercourse with foreign Powers. These conventions the Pederal Council decides to be matters with which they have no conservations that they have no conservations that they are not engagements entered into by the Council decides to be matters with which they have no concernres inter alios acts; they are not engagements entered into by the
Confederation, nor are they in any way confirmed or guaranteed by
the Confederation. Is dealing with the Pope all this does not
much matter, but supposing an international question with any
other Power should arise out of an obligation contracted by a
Canton in the old state of things, to whom have the obligations of
that Canton passed now? The case is certainly not a likely one
to happen, but it is theoretically possible.

Among the appeals with which the present Report deals, the first
begins in the Canton decreed the separation of Church and State,
the separation of the Canton as such from the Bishopric of Basel,
and ordered among other things one which we should like to hear
more about in detail. This is, that in all the schools of the
Cantons religious instruction should be given in a form independent

Cantons religious instruction should be given in a form independent of all confessions—that is, in our own kindred jargon, in an undenominational form. On this the Swiss Bishops, through the Bishop of Sitten, send a memorial to the Federal Council praying that the Confederation will interfere to induce the authorities of Aargau to rescind the vote for the separation of Church and State, and to observe strictly the treaties touching the institution of the Newform. Distropric. The Federal Council now makes answer that it can do nothing. In the separation of Church and State, the Canton of Aargau has not gone beyond its rights as a sovereign Canton, and the treaties about the diocese are res inter alios acta, with which

of Thurgau, claiming that the Canton should be represented in the Diocesan Conference by Catholic deputies of the choice of the Con-Diocesan Conference by Catholic deputies of the choice of the Consistory, and no longer by deputies, Catholic or Protestant as might happen, named, it is not clear whether by the Legislature or by the Executive of the Canton, but in either case by the Canton as a State and not by the Catholic part of its inhabitants. This appeal again is rejected, and we hardly see how it could have been otherwise. For whatever may be the ideal right of the case, as a matter of fact it was the Canton as a Canton which had always acted in matters relating to the Bishopric. One might have said that it was only fair and decent to appoint Catholics only to sit

Next comes an appeal from the Catholic Consistory in the Canton

the Confederation has no concern.

that it was only fair and decent to appoint Catholics only to sit on a body which has to deal with the internal affairs of their own religion, but the Federal Council does not sit to decide questions

of fairness and decency, but questions of constitutional law.

Next come the documents dealing with the deposition of Bishop Lachat by the Diocesan Conference. This act took place on the 29th of January, 1873. By that act the see is declared vacant, Bishop Lachat is forbidden to exercise any episcopal function, the Governments of the Cantons concerned are invited to with the content of the content of Selection. the Governments of the Cantons concerned are invited to withhold the episcopal income, and the Government of Solothurn to look to the removal of the prelate from the episcopal palace. All this, to say the least, is rather a high-handed way of doing things on the part of a body whose competence was at any rate sure to be called in question, and it shows to our mind the awkwardness of a state of things in which the Bishop of Basel stands without any intelligible superiors, temporal or spiritual. Ecclesiastically he is immediately under the Poye, without any Metropolitan. As a man, he is doubtless subject to the laws of the Swiss Confederation and of the Canton of Solothurn. the laws of the Swies Confederation and of the Canten of Solothum. But, in what we may call the temporal side of his existence character, the check on him seems to lie only in this conservational character, the check on him seems to lie only in this conservation shadowy Diocesan Conference. This body predesses to depose will from his Bishopine; but it is clear that sealous Ostholies will not look on such a deposition as good for anything. And it is no liest clear that the Conference cannot of itself stop the Bishop from his income, or drive him out of his palace, but the District him the Cantons which have the power to do so. It is these that that

a a deposition suggest both from its spiritual and temporal side, ain a dead latter. Against this act in is not wonderful that a ther of apposit should be made to the Council. The deposed ate is naturally the first to appeal. He of course denies the or of appeals should be made to the Council. The deposed is anticulty the first to appeal. He of course denies the sity of the Conference to depose him, and maintains that the acts of the Conference are further contrary to various articles, both of the Federal Constitution and of the Constitutions of the Cantons carned, and that they are further in themselves null, as two of concerned, and that they are further in themselves hull, as two of the Cantons which form past of the diocese, Luzern and Zug, have had no share in the act. The appeal of the Bishop himself is approved by a number of appeals from various Catholic hodies within the diocese, all protesting against the act. It is argued, for instance, that the deprivation of the Bishop by the Diocessan Conference violates the article of the Federal Characterision which forbide any man to be mid-like act. Constitution which forbids any man to be withdrawn from the jurisdiction of his natural judge. It is also argued that in the Cantons of Thurgau and Solothurn the deposition of the Bishop ought to have been put to a vote of the people. But the Federal Council argues that the act of the Diocesan Conference is not a judicial one, and therefore was not contrary to the clause of the Federal Constitution appealed to. And it argues that, as the Bishop was not deposed by an act of the great Councils of Thurgan or of Solothurn, it is not an act which can be brought to a vote of the people of those Cantons. In fact the long and acute arguments of the Federal Council all tend to the one conclusion that they have nothing to do with the matter, and that their only duty is to do nothing. We are far from saying that they are wrong, but we do say that the whole dispute shows how anomalous the whole state of things is. If the Federal power had direct jurisdiction in the matter, or if the diocese of Basel were confined to a single Canton, the course would be clear. There might be a to a single Canton, the course would be clear. There inight be a struggle between Church and State, but there could be no question as to who represented the State. If a Bishop is deposed by Act of Parliament, here or in any other country which has a single Parliament co-extensive with the whole country, zealous churchmen may declare the act to be spiritually invalid, but there is no doubt as to its temporal effect. It is much less clear when a Rishop is deposed, not by the Legislature of any independent State, but by a an Conference made up of deputies from several independent States, and which does not seem to have ever received any commission to depose Bishops. All that the Federal Council was conwas to oust their own jurisdiction, and this they have very successfully done. They were not called upon to say whether the acts complained of were right or wrong from any other point of view, and they therefore really leave the matter in as much confusion as they found it.

THE ORGAN OF THE ORTONS.

The will readily be understood that "the greatest circulation in the world " is not to be supported by ordinary means. There are pushing publicans in low neighbourhoods who do not rely altogether on the fierce temptations of their vitriolized gin and hocused beer, but who make a point of having always some extra attraction on hand—a breas band for Saturday nights, a dwarf, or a fat girl, or some other monstrosity in the bar, or perhaps, if nothing better is to be had, a stuffed two-headed terrier in a glasscase. The Desity Telegraph would seem to be conducted on a similar principle. It appeals to a vulgar appetite for coarse and fiery sensationalism, and it is necessary therefore that the supply of sensations should be vigorously kept up. It must be admitted that these are at least forthcoming in sufficient variety. Now it is the "People's William," amid the glare of literary red-fire and Boman candles; now it is a notorious Parisian prostitute whose private life is flashed upon the public through the electric wire. Another day we have "the old savage of the desert," followed by the startling news of the fall of Khiva just a month or so before Khiva falls. Poor Madlle. Deselée on her bier is served up for the gratification of a diseased curioaity with as little compunction as Cora Pearl in her boudoir. Nothing is sacred, nething respected, if only it can be made to answer the purposes of trade. A Correspondent sent down to Portsmouth to describe the arrival of the troops from Africa seizes upon "a lady in deep mourning, with a fair-haired girl.all sable, save for the clean white pinafore," who comes sitently down to her meals in the hotel where the Correspondent is staying. "There is no welcome for the softwoised lady, no kisses for the fair-haired child. She will see the old regiment march into barracks or to the station, hear the band play, and weep when the honest people shout. What can this poor creature be doing here? Why "—and so on, with more in the mass scheming strain. It is to be hoped that at least "

sight they love is severed needs, and spouting blood, and corpose that line the road in a deed procession." We might say of this description, as the writer says of Commanie, at every shuddering breath the stomach turns. It might aimout have been written by a gorged vulture in a nightmare. Even the Telegraph itself, in its eagurness to pander to brutal tastes, has soldom produced anything more losthsoms and disgusting. Some allowance, however, must be made for the present exigencies of that unhappy journal. It has lost the political ideal on which it traded, and needs all its old savages and dead processions of swollen corpose to fill up the gap. The "People's William"—slas! no more the people's—has ceased to be of commercial value, and a substitute of some kind must be found.

must be found.

This circumstance perhaps helps to explain why the Orton family have been added to the attractions of the Telegraph. The confidences of the late Cabinet are replaced by the confidences of Arthur Orton's brother and sisters; and the Telegraph apparently is only sorry that the prejudices of the Judgue should have prevented it from becoming the organ of Arthur himself. "If," we are told, "public opinion had had its natural expression, as it has upon vital laws under debate, great social problems unadved, and all the other matters where it is found to assist morality and right judgment, the case might have been out short long are, to the immense economy of public time and money; and ago, to the immense economy of public time and money; and Justice would not have addly seen the instincts of uninformed persons going against facts." There can be no doubt what this persons going against facts." There can be no doubt what this means. The Penly Telegraph is—at least in the opinion of the means. The Ikuly Letegraph is—at least in the opinion of war Daily Telegraph—the natural expression of public opinion; and if it had only been allowed at the outset to "assist morality" in its own peculiar manner, the Tichborne case would have been very soon disposed of. "It is the one instance where the papular voice has gone wrong, and it is also the one instance is which it massived no suidance and no halp to discussion and decision from received no guidance and no help to discussion and decision from the press." It would no doubt be "an immense economy" if the the press." ts of law could be abolished and the administration of justice left to the discretion of the newspapers. It would only be necessary for some public officer to observe what each of the papers said on any question which happened to be raised, to ascertain their respective circulation, and to make an award in accordance with the opinion expressed in the paper which sold the largest number of copies. It is worth while, however, to observe some of the possible consequences of such an arrangement. In the present instance the Telegraph has arrived at the conclusion that Arthur Orton is an impostor, and this is also the conclusion of the jury. It may be observed, however, that the fact that the Telegraph holds this opinion now, after the imposture has been completely exposed and Arthur Orton condemned, is by no means a guarantee that it would have been found on the same side if it had taken up the matter at the beginning, and evolved the truth from its matter at the beginning, and evolved the truth from its own internal consciousness. Its sympathies, as it is perpetually beasting, are always on the popular side. The classes to whom it chiefly appeals to support its circulation are just the very people who used to cheer the Claimant; and it is easy to conceive how strong the emptation would have been to espouse the cause of the Paople's Roper. This would have been the remular side and it is easy to conceive how strong the remular side and it is easy to conceive here. Roger. This would have been the popular side, and it would also have been the side out of which the greatest amount of semention might have been extracted. It is a very tame business going over plain facts which, if looked at in a commonsense way, can only plain facts which, if looked at in a commonsense way, can only point to one conclusion. Nothing can be more commonplace than an infant heir's succeeding in a hum-dram way to an estate because it had fallen to his father after his uncle's death. The romantic improbabilities and impossibilities of the Chaimant's story, the vicissitudes of his career, and the racy peculiarities of his own character, would, we fear, have been, for a mind constituted like that of the Daily Telegraph, a dangerous weight in the other scale. It is easy to see in which direction there would be the greater scape for rowerful writing and for the excitement of public curiosity: for powerful writing and for the excitement of public curiosity; and it is obvious that, if the *Tolograph* had quashed the (liginant at the outset, it would have deprived itself of an article of commerce which has probably been highly profitable to it during the last year or two.

On the whole, then, considering the ordinary tendencies of the Telegraph, its worship of notoriety, its systematic pandering to vulgar appetites and projudices, and its reckless manufacture of sensations, it may perhaps be doubted whether it is quite certain that it would, if left to itself, have arrived at the conclusion which it now supports. In any case, however, nothing can be more certain than that, if discussion had been telerated, the Claimant would have found support, if not in this, at least in some other newspaper or newspapers. There would have been papers taking each side, and day by day the question would have been complicated and obscured by inflammatory articles, and by assertions of so-called facts which cluded every kind of examination. The speeches which were made at the Claimantis meetings give some idea of the tone in which the controversy would have been conducted at least by one party, and there is no reason to suppose that the other would have altogether escaped the infection. The letters which the Telegraph has been publishing since the close of the recent trial illustrate in a staking manner what would have been the consequences of allowing public opinion "its free natural expression" during the course of the inquiry. This correspondence begins with a statement purporting to have been taken down from Charles Orton, in which he confirms the justice of the verdict on his brother, and attailing appears to have been excited by learning that his assem,

Mrs. Tredgett and Mrs. Jury, were receiving "their five pounds a month in a regular manner" on the understanding that they should "be careful and keep their own counsel." He wrote to his brother as Sir Roger, and assuming him to be a friend of Arthur Orton, asked for a little assistance. After an interval, during which he had made overtures to the other side through Mrs. Pittendreigh, he received a mysterious reply from Croydon—"Why should you in had made overtures to the other side through Mrs. Fittendreigh, he received a mysterious reply from Croydon—" Why should you injure one that never did harm to you? I shall send you in a day or two what you require. Desist"—this last word appearing in the place of a signature; and this was followed next day by a five-pound note, and a promise that it should be continued every month. It was while this subsidy was being regularly paid that Charles made an affidavit that Arthur was not his brother; but after a time the payments began to fall off, and when Arthur sailed for Chili, Charles, never expecting to see him return, thought that the moment had arrived for going over to the Tichborne family. He calculates that, taking it altogether, he did not receive more than eighteen shillings a week from Arthur, and in a second letter he states that he afterwards obtained for some time a pound a states that he afterwards obtained for some time a pound a week from the other side, who have, however, refused to do anything more from him. Not content with denouncing his brother, Charles denounces his sisters too, asserting that they knew perfectly well who the Claimant was, and among themselves "never spoke of him but as Arthur." This accusation has brought forward the sisters in self-defence. Mrs. Jury denies everything Charles has said, except that he was on bad terms with his sisters, for which, she says, they can "give good reasons, not the least of which is his conduct in having lent himself to be the associate of detectives and conduct in having lent himself to be the associate of detectives and others in sending into penal servitude for fourteen years a gentleman whom he knows to be no more his brother Arthur than he is himself, and which he does simply for money, being too lazy to work for his bread." Mrs. Tredgett is also very sorry to have to write as she does of her brother Charles—"so bad a son of so good a father"; but, she says, "I cannot find it in my heart to stand by and see a fellow-being thrust, as the Claimant is, into penal servitude for fourteen years as being my brother Arthur, when I well know he is not, without lifting up my voice against it, and against the brother whose conduct has helped to lead up to it." The Claimant's behaviour to herself and her sister was "that of a gentleman, and not such as an impostor would have used—even to gentleman, and not such as an impostor would have used—even to his sisters." Mrs. Tredgett does not indicate how she thinks an imtor would be likely to treat his sisters, but it seems not improbable postor would be likely to treat his sisters, but it seems not improve that he would think it necessary to pay them for their silence. Mrs. Tredgett is apparently under a misapprehension in supposing that Charles helped to bring about his brother's conviction; for he was not called as a witness, partly on account of his false affidavit, but chiefly because there was an overwhelming body of testimony without him. Since Mrs. Jury and Mrs. Tredgett have thought it worth while to vindicate their characters, it would have been it worth while to vindicate their characters, it would have been interesting to know why they were not examined on behalf of the Claimant. The only explanation is either that they themselves were afraid to go into the witness-box, or that the Claimant's advisers were afraid to put them there. If they were as anxious as they say they were to save an innocent man, it is strange that they should have postponed their testimony in his favour until after his condemnation; but statements made in the witness-box might have involved responsibilities which do not attach to letters to the newspapers. Mrs. Pittendreigh also has joined in the correspondence. "There has been," she says, "no person whose name has been associated with the Tichborne case more cruelly calumniated than mine, and no person deserves it less"; but unfortunately she throws no light on the only point of interest with which she has been connected—the forged letters which were produced at the former trial; nor is it quite clear how she came to be connected both with the Ortons and the Tichborne family.

Now that it is known that the Daily Telegraph is holding

with the Ortons and the Tichborne family.

Now that it is known that the Daily Telegraph is holding an open court where any one can say anything he or she chooses, without fear of being cross-examined or prosecuted for perjury, it is possible that other persons besides the members of the Orton family will come forward to defend their conduct and to offer explanations. It is obvious, however, that all statements of this kind are simply worthless, being made without responsibility, and without being liable to the test of cross-examination. There is no reason to suppose that the Daily Telegraph is really foolish enough to believe that it is serving the ends of justice by publishing this correspondence, or that it has any object in view except to keep alive for a little while longer a profitable sensation. It enables us, however, to form some idea of what trial by the Daily Telegraph would amount to if it became an institution of the country.

INFANTRY TACTICS SINCE THE WAR.

WHATEVER may be thought of the cause, there is no doubt WHATEVER may be thought of the cause, there is no doubt as to the fact, that one result of the great struggle of 1870-71 has been that its tactics have been looked upon as a completely fresh starting-point for further reforms in that branch of the art of war. It might naturally have been expected that this would rather have been the case with the Bohemian campaign of 1866, when the terrible power of the breechloader was first demonstrated at the cost of Benedek and his army. And the movement of which was are speaking did indeed in a sense begin soon after with the publication of the Retrospect. But the controversy which that famous the property and although the spirit of its criticisms entered into and

influenced, perhaps unconsciously, every branch of the Frust ermy, no actual embodiment of the new teaching had appeared army, no actual embodiment of the new teaching had appeared at that time in the regulations of the service, nor was its truth admitted by those who had to superintend their working. Hence it is that the battles of Woorth and Spicheren were fought without any other guide than the Instructions of 1847, brought into more practical working by the experiences of 1866, which were rich no doubt in teachings of their own, but not wholly applicable to this new case where the fire of the needle-gun was overpowered by that of the Chassepot. Both victors and vanquished now powered by that of the Chasepot. Both victors and vanquished now avow that the circumstances carried them far beyond all existing forms when these were brought to the new and terrible test of breechloader fire. It is not surprising, therefore, that the Germans, in order to keep their place in advance of other tacticians, have already modified their drill practice. But the latest changes in their infantry instructions (of which Colonel Newdegate has given English readers an excellent account) are avowedly tentative, and therefore open to debate. Military reforms are almost invited, as it were, to speak out; and one at least has been found who desires to tread in the steps of Captain May, and to complete his work by advocating "Timely Alterations in the Drill Instructions" (Zeitgemüsse Veründerungen des Exercier-Reglements der Preussischen Infanterie. Leipsic), very much in the sense in which that celebrated essayist wrote.

It must not be supposed that the mantle of the author of the

It must not be supposed that the mantle of the author of the Retrospect has wholly fallen on the anonymous pamphleteer who follows out his ideas. Readers of the Zeitgemässe Veränderungen will find in it but little trace of the vigorous imagery of the original reformer on whose work it builds. It is useful, however, as presenting in a clear but somewhat dry form the results of recent presenting in a clear but somewhat dry form the results of recent experience, as they are seen by the most numerous and not least intelligent class of officers who are personally concerned with them. A more general view of these results is best to be found in the work of Boguslawski. The present essayist, who writes anonymously, confines his attention solely to the work of the arm to which he belongs, and to the development of the special infantry tactics created by the war. He prefaces his study with some very plain, if not eloquent, observations on the conduct of matters in 1870, which may well account for his withholding his name. Whilst admitting the truth of the well-known military rule which guides such matters in Prussia, "Regulations should not be experimental, but the result of real experience," he points out that, although the army had had the special good fortune of success in 1864 and 1866, when the requisite trial was made of the working of those small tactical units known as company-columns, and first officially introduced in 1847, yet it was allowed to enter on its third war without any of the altered training to which the facts of the two former wars should have pointed. Hence it was compelled to fight in forms which had not been, as they should have been, made its second nature, but which (as the use of the company-column in manceuvring) were varied according use of the company-column in manocuvring) were varied according to the commander's fancy with different bodies of troops; and as these, even thus freely treated, failed to meet the exigencies of the breechloader, it was driven to make new experiments in the field. The victories of the Germans were due, this critic declares, to their strategical leading and to the courage and energy of the troops, aided by the mistakes of the enemy; but no one can praise their tactical handling either in the mass or in detail. Indeed the extraordinary losses suffered, such as those at St. Privat, were really due to the lack of drill instructions suited to the time, and to the bad tactics which resulted from it. The Prussian army was compelled, just as was the French, to fight in quite another mode than that in which it had been trained; and every chief of a company or battalion had his own little method for the occasion. There is now, however, plenty of experience gathered. All points to an alteration of the forms in use, and the only question is in what direction and to what extent these the occasion. shall be modernized.

Having thus, like his forerunner, prefaced his proposals with sharp criticisms on a successful campaign, the essayist applies himself to his real work. The rest of his treatise may naturally be divided into two parts. In the one he examines the tentative drill recently practised by the Prussian infantry, and in the other

he puts forward his own scheme as a substitute for it.

In the first part he examines the method so much employed in the German army of using half-battalions at certain stages of a movement, and shows its defects, which are indeed usually admitted, since its use is rather the result of accident, arising out of the discovery that a battalion is too much for any one man to manage when the fire of the enemy compels him to diamount. The emayist has no difficulty in showing that this arrangement, with its two chance commanders acting under the battalion field-officer, is in every way tactically inferior to a proper use of the four companies individually under their regular chiefs. From this he passes to a detailed examination of the experimental drill tried last year, which consists, as to the first or real fighting line, of the two wing companies advanced in the normal division of skirmishers and supports, but the latter opened out, and these followed by the other two, acting together as a half-hettalion in a column drawn up with increased distances between its sections. The second line, again, follows entirely in similar columns, or in line with intervals. These new fermations of column and line are absolutely condemned, as rendering moreoments slow, and forming needlessly large marks for distant fire. There would be no necessity, it is pointed out, for using them if the reviews of the drill-book would take hold of the simple the discovery that a battalion is too much for any one man to mana

treth that the day of lattellion movements has gone by, and that he widther should discretive be taught and trained entirely in the school of that company in which he invertibly has to fight. Having self the way in this conclusion, the writer gone on to suggest the beautifications which he proposes in company drill, and which consist, in fact, in making the present commanding officer of a bettellion act as one at the head of several factical units brought together, instead of regarding his charge as a single one to be temperarily separated on occasion.

To will be seen that in this respect he goes further than

temporarily separated on occasion.

It will be seen that in this respect he goes further than May, who, in his Prussian Infantry in 1869, advocated a new drill of his own, which was founded on the battalion. And as this second publication of his awakened much controversy when it appeared, it is as well to add here that the "open-order line" which he proposed, and which was so strongly objected to, was but a prophecy of the "firing-line" of the battles of 1870-71, on the use of which, as being the only possible form of attack with the breechloader, so much has been written recently. It must be said, however, that May did not discover that this would become but one with the line of skirmishers, which in his proposal was retained for separate action in front of it. And the new essayist follows out his leading idea more logically than May, since he insists that the company, which facts have made the fighting unit—as the Retrospect pointed out after the war of 1866, and Von Moltke himself had indicated even before it—should also be made the unit for all training purposes, so that the practice of be made the unit for all training purposes, so that the practice of peace should be henceforth in thorough conformity with the facts of war, and the infantry soldier enter on his work in the field as something thoroughly familiar to him.

Whilst the German army is thus found engaged in critical examination of its past and experiments and projects for the future, it is natural to ask whether the same activity of thought is displayed by its late adversary. The answer is that, though much is and has been said in France of improved organization and modified tactics, hardly anything of a practical nature has been done in either direction. Officers of the more educated class do done in either direction. Officers of the more educated class do indeed meet for discussions, listen to lectures, and read eagerly the numerous translations of German books which the Paris press sends out, but there is no originality of thought anywhere apparent. No Frenchman, for example, appears to have put forth any essay as to new infantry tactics that has been as much read among his comrades as the Paris translation of Major Tellenbach's late lecture on the "Fighting of a Company in Loose Order." This remarkable study is devoted to suggestions for the practical working in the field of the new unit, and aims at giving at once more intelligence in the general direction, and freer scope to the powers of those who lead its component parts of sections and groups under the captain. The author's special object is to combat the notion of those who believe author's special object is to combat the notion of those who believe the day to be arriving when the battle of infantry will dissolve into a mere horde of active and intelligent skirmishers, fighting altogether independently, though influenced by some general direction. There is no possibility, he shows, of any such solution of the problem now before his comrades. The ideal of a tirailleur's tactics is individual action, no doubt; but it must be united with the greatest possible facility of directing the whole body. And, in proceeding to show that the company formation is very best agency discoverable for this under present conditions, and in elaborating the means by which it may be used to the greatest effect by Gurman officers, Major Tellenbach's lecture affords unconsciously a strong confirmation of the truth of the Leipsic unconsciously a strong confirmation of the truth of the Leipsic essayist's theory already noticed, that the day is past for training infantry, save for mere parade purposes, in any other school than that of the company. The view of the latter writer, though he does not cite his original authority, as he might well have done, is in fact simply that the time has now arrived when May's predictions have become proved facts, and when his suggestions should be carried out to their logical results. But forms are ever more slow to change than the arms which they have been framed to use. The same spirit of conservatism that frowned on the Retrospect is still strong in the Prussian service. And the next war on which it enters may very probably find the Mauser rifle in each infantry soldier's hand, and the guns that cover him vastly improved on those of 1870, without the system of battalion manœuvres to which European armies are chained by tradition having disappeared before the progress of tactical reform.

PRINCE FLORESTAN.

LITTLE book which has just been published under the title of the "Fell of Prince Floreston of Monace, by Himself," would perhaps scarcely call for remark were it not for the strange parade with which it has been announced, the ridiculous remours which with which it has been announced, the ridiculous ramours which have been circulated as to the supposed authorship, and the equally absurd praise which has been bestowed on a very medicere production. "I am Prince Florestan of Wurtemberg"—so it begins—"boxs in 1850, and consequently now of the mature ago of twenty-four. I might call myself "Florestan II.," but I think it better taste for a dethermed Prince, especially when he happens to be a Republican, to resume the name that is in reality his own." To give an air of reality, to the namethat is in reality his own." To give an air of reality, to the namethre, it is preferred by a sketch of Monace reality, and a map of the principality; and the name of real paragons are finely introduced. It is intimated that within the last first

months the then releasing Prints. Charles III., was personable by his only son, Prince Albert, to go to see with him in his packt for a brief cruise. It came on to blow hard that night, and nothing was heard of them again. Prince Albert's little boy, six wears old, was proclaimed sovereign, and Florestan, son of the sister of the late Prince, found himself unexpectedly next heir to the throne of Monaco. A few days afterwards the young prince was thrown out of his carriage and killed on the sput, and the throne itself was now open to Florestan—"a half-Protestant, half-free-thinking, Republican, German, Cambridge undergradusts, anddenly called to rule despotically over a Catholic and Italian people." He tells us that he was thoroughly English in his ways, having been educated at Eton and Trinity. At Eton he had lived rather with the King's scholars than with his own natural allies, and at Cambridge his friendship was more in King's than in Third Trinity, and he joined the First Trinity Reat Club in order to avoid the exclusiveness of the Third. His opinions were those of universal negation. He had heard Mr. Seeley at the Union windicate the Paris Commune, and had supported a motion for applying the surplus funds of the Society for the erection of statues of Masaini in all the small villages of the West of England, which was carried, but neutralized by the fact that no surplus funds ocald he carried, but neutralized by the fact that no surplus funds could he discovered. He had subscribed to the West of England, which was carried, but neutralized by the fact that no surplus funds ocald he carried, but neutralized by the fact that no surplus funds ocald he liked Sir Charles Dilke, and cherished "the ordinary undergraduate detestation of Mr. Gladstone." There were," he says, "no Liberalis at Cambridge. We were all rank Republicans or champions of Right Divine." Mr. Disraeli was his admiration ass public man, because "in politics one always personally prefers one sopponents to one's friends." Under these circumstances Under these circumstances a throne had no charm for him, and he would have gone to Monaco to proclaim a Republic if he had thought that the French would allow it. The next heat thing was to exercise his sovereignty in the interests of Liberal progress his experiences in carrying out this design form the main subject of

the story.

Ilis first step was to put a stop to the minute personal supervision to which his people were subjected. The weekly reports informed him that on such a day a man named Marsan had called the carbineer Fissori a fool, that such a tishing-boat had gone out and such another come in, that a private in his guards had caught a cold in his head, and so on; and these absurd details disgusted him. "I gather," he told M. de Payan, his Minister, "from this tedious document that my principality of five thousand persons possesses every appliance and every excrescence of civilized government except a Parliament. The perfection of bureaucracy and of red tape has been reached in a territory one mile broad and four red tape has been reached in a territory one mile broad and four red tape has been reached in a territory one mile broad and four miles long. Contralization may be less hurtful than elsewhere in a country that is all centre; but I mean that this should cease." He ascertained that there were eleven hundred and sixty posts to fill in a country where there were only thirteen hundred grown male inhabitants, and that consequently many posts were filled by a single man. Public works were dealt with liberally by M. Blanc, as a part of his "concession" of gambling-tables, and from the same source the income of the Prince was largely aided. M. Blanc's enterprise excited his admiration; and on visiting the Casino, he found the proprietor a little new less and on visiting the Casino, he found the proprietor a little new less and on visiting the Casino, he found the proprietor a little new less largely aided. M. Blanc's enterprise excited his admiration; and, on visiting the Casino, he found the proprietor a little man in black, who, when a few years older, will be as like M. Thiers in person as he is already in tact, power of talk, decision of manner, and a total absence of fixed opinions. M. Blanc was amusing himself with a mild game of l'atience—he never plays anything else, and knows sixty kinds. Florestan's idea was to turn the roulette revenue to account in making Monaco a Munich and Dresden all in one, with a gallery of the greatest modern paintings, a magnificent orchestra, a theatre of the first rank, and, in short, art in all its highest forms. He found M. Blanc hesitating whether English families would be most attracted to Monaco by pigeon-shooting or by an English church; but his choice was in favour of the former, on account of the opposition of the Jesuits to the church. Florestan told him never to mind Jesuits; but M. Blanc, with a significant smile, remarked Jesuits; but M. Blanc, with a significant smile, remarked that he would sconer not go against them. The sagacious manager thought that the theatre, orchestra, and works of art might perhaps be made to pay; at any rate they were only matters of money; but over the reform of the army, of the Church, and of education, of which Florestan spoke, he shook his head. "Why trouble yourself?" he asked. "You are rich, and your people are contented." The commander of the forces did not relish the reform of the army. Pare Pellico the Legit priors who wellly valled. contented." The commander of the forces did not relish the reform of the army. Père Pellico, the Jesuit priest who really ruled the country, had no objection to a national milita, but resisted any meddling with the Church or education. Dr. Coulon, the only Liberal in Monaco, sympathized with the Prince, but asked him how, as a democrat, he could think of imposing his will on the people in a matter on which they were unanimous. Père Pellico was in favour of a Parliament which he knew he could get Pellico was in favour of a Parliament which he knew he could get elected to suit his views, or a plobiscite which he could dictate beforehand. "How liberal a politician can afford to be," thought Florestan, "when he has the people with him!" The only one of the reforms which was popular was the national army, which the reforms which was popular was the national army, which their wives. An edict on the subject of education created much dimetical colors, and an inopportune visit from General Garibaldi, who make a furious speech against the Pope, brought matters to a crease.

The results of the property of the property of the property of the property of an according to France. The Non was M. Blanc, who,

... Corp

as a Frenchman, had no right to vote at all. On his return to Cambridge the Prince finds himself at one with Mr. Freeman in thinking that a sudden breach in the continuity of national institutions is an evil, and that the more gently and warily the wards is done the more likely it is to be lasting.

It will be seen that this is a not very wonderful squib on a somewhat hackneyed subject. It is the cort of thing which has been productive for a small college with but injustice has been

It will be seen that this is a not very wonderful squib on a somewhat hackneyed subject. It is the sort of thing which would make a reputation for a small college wit, but injustice has been done to it by the extravagant manner in which it has been put before the world. Even a really clever book would be almost certain, under such circumstances, to disappoint expectation; and Prince Florestan is rather smart than clever. A good deal of its fun borders upon impudence, while some of it preses decidedly over the line. To say, "I have seen many amusing sights in the course of my short life, I have seen an Anglican clergyman dance the can-oun," is not exactly wit. If it is true it is hardly a joke, and if it is false it is also stupid. The introduction of real names betrays a prosaic mind and poverty of invention, and weekens instead of strengthening a fanciful tale. Reference to "a hall-porter as big as Mrs. Bischoffsheim's" may perhaps be supposed to supply that local colour which is so refreshing to some minds; but the story about the Duke of Cambridge, at p. 70, is simply a vulgar personality. The idea of the book, though not new, is a good one, and might have been worked out with much effect; but unfortunately it is treated in a weak and superficial way. The writer just sees his opportunities, but wants power to use them. He tells us that there is no moral to be drawn from the fall of Prince Florestan which is applicable to the present state of English politics; but possibly Mr. Gladstone's overthrow may be glanced at in the career of the headlong young despot who wishes to compel his people to be as democration himself whether they like it or not. It is also suggested that the best chance for Republicans is to leave religion alone. The author describes English constitutional Monarchy as a democratic Republic tempered by snobbism and corruption, and expresses his preference for a "socialistic autocracy," provided you can secure the best of autocrats. On the whole, this satire appears to be wanting equally in ph

POPGUNS FOR TWO.

A NEW chapter has been added to the history of duelling.

A Honour has been satisfied among the pupils at Mr. Swift's school at Lincoln, and a jury have seen their way to a verdict of "Not guilty" in the trial which has arisen out of this duel. The prisoner was fourteen years of ags. The weapon which he used was a piatol, such as is ordinarily sold at toy-shops for sixpence, and was meant to be used with caps only as a popgun. It appeared to be made of some brass material, and had a trigger. It was difficult to conceive, says a reporter of the trial, that any one should attempt to load it with powder and ball, and we should think that the danger of standing behind it when about to be discharged was greater than in front of is. The firearms supplied by English traders to savge races have considerable capacity for harming those who use them, and it is no disparagement of the gallantry or skill of our troops to suggest that probably a large percentage of Ashantess were killed or wounded by their own weapons. If, however, the parties in a duel are supplied with pistols equally liable to explode backwards, there is of course equal risk to both; and this would be perhaps a more satisfactory arrangement than the use of strong, but ill-made and erratic, weapons which would almost preclude the possibility of a second finding a safe place to stand in. It appears, indeed, that that which might have been expected from the use of sixpeny pistols did actually occur, except that one of the parties got it both ways from his own pistol and his adversary's, while the other escaped untouched. All the formalities were observed exactly as they are laid down in treatises on the subject. The seconds loaded the pistols. One of the seconds measured out thirteen paces. Two pegs were fixed in the ground, and a combatant placed himself at each peg. They both aimed. One of the seconds counted three and dropped a handkerchief, and both fired. Seagrave's pistol burst in his hand. He called out that he was hit and baseding. The boys not actor

coly breath, but bleed, was spent. Burn, who owned the pistols, appears to have instructed and emouraged the other begin in their use. Hanks, who was ten years old, fought a deal with Dawson, at which Burn was present. A bullet grazed Banks's hand. "They did not think that the pistols would hart, but thought they would hit." It was true than when Burn she was the post the bullet went half an inch into the wood, but he was surgeon's evidence that a bullet must have gone half an inch an more into Seagrave's leg. He had been in some danger from the wound, but was expected to get well. The father of Hurn deposed to his usually peaceable conduct, and the jury, probably to the satisfaction of themselves and everybody in Court, were able to arrive at a verdict of not guilty of shooting with intent to do grievous bodily harm. The play of judge and jury was converted, in the case of Burn, into a formidable reality, and we can only hope that the red gown and flowing wig of the Judge have produced a suitable impression upon the mind of the youthful prisoner.

The first and most obvious comment upon this case is that, if boys will fight at school, they had better fight with fists in a fair ring. We have heard indeed of "seminaries," or "establishments for young gentlemen," where there is no fighting, and no desire for it. Whether this delightful result is due to the character of the master or of the boys we do not know, nor do we greatly care, as, if real, we are sure that it is exceptional. Few fathers, if they were honest, would confess that they would wish their sons never to have fought at school; but certainly the introduction of pistols, and particularly of sixpenny ones, is alarming. This display of manly spirit in boys has occurred at a private school; but boys at public schools are not deficient in pugnacity, although it has not usually armed itself with any weapons beyond those which nature has supplied. The Report of the Fublic Schools Commission which deals with games, fagging, and flogging, is silent as to fighting, although the Commissioners must have remembered their own school days, and may have supposed that the nature of boys was not greatly changed. It was told of a schoolmaster of the barbaric eighteenth century that, if two boys were brought to him for fighting, he supplied each of them with a birch, and bade them lay on, adding that he would flog the boy that first gave in. This ingenious trant belonged to a species of schoolmaster now happily extinct. His successors probably avoid as far as possible knowing anything about the details of school fights, trusting to the supervision of the older boys or to some general regulations to prevent roughness degenerating into brutality. The force of "public opinion," even in a small private school, is shown by this Lincoln duel, and one of the best hopes of school-masters lies in giving to this public opinion a healthy tone. If a duel with sixpenny pistols could come to be regarded as a rid-culous burlesque of manliness, there would be little danger of bullet-wounds being given in the leg by way of satisf

bullet-wounds being given in the leg by way of satisfying honour. This occurrence renders credible the stories of duels among women which writers on the subject have collected. The Duc de Richelleu caused a duel between two ladies through the blunder of his secretary, who appointed both to visit him at the same hour. The Marquise de Nesle, invited by her rival to fire first, only cut off a branch of a tree. Then the Contesse de Polignac exclaimed, with the coolness of a bully, "Your hand trembles with passion," and, firing in her turn, cut off a small piece of the ear of the Marquise. Another duel between a dancer and a singer of the Opera in Paris was interrupted by the arrival on the ground of the lover about whom they had quarrelled. His impassioned oratory produced small effect, but luckily he managed to get hold of the pistols and drop them in a wet place. In some of the most bitter of these quarrels the combatants aimed with swords at their rivals' faces and bosoms. One lady actually fought a duel with her lover, although it is difficult to understand how he could have been induced to fight with her. Perhaps the so-called duel was like one of those brawls where all the beating is on one side. An actress of the time of Louis XIV. of France was an accomplished fencer, and bullied all men who dared not meet her. She must have been an awful tyrant of society. The greatest bully among men usually confines his outrages to his own sex, but this woman insulted other woman, and if men took their part she made those men fight with her, and killed them. We believe that Lola Montez fought duels, and we are sure that, if she did not, it must have been for want of opportunity. A woman of good nerve might make a formidable antagonist with pistols, and even with the small sword skill would go far to supply the want of strength. According to the notions which formerly prevailed, the weakness of the weapons which were used by the two boys at Lincoln would rather have been a cause of danger. An experiment was likely and wea

men to when he was seet an application. However, he returned with the document to the principal, who remarked that the word "applicat" was written with two pts. The frithmen insisted that the word "applicat" was right, and wanted to fight his principal upon the question. The boy Burn, who insisted on giving to Seegrave "another chance for his honour," would have become a celebrated duellist in the last century if he had not been killed out of it at a premature age. His presence at the Lincoln school seems to have operated like that of Sir Lucius O'Trigger at the Bath assemblies, and if he had not edged in words about honour and provided pistols, a farce which nearly ended tragically would not have been began. There are not many records of duels between boys, but we read that an Irish child of six years was brought out "to see papa fight," which, considering that both principals and seconds engaged with pistols, and atray shots must have been flying about, was neaful practice. It is easy to see from the example of this school that when once "public opinion" had been created in any society neither good sense nor morality could long stand against it. Among the men of our time the best security for abstinence from duelling is the dwad of ridicule, but if public sentiment should alter, we doubt whether law would operate as a restraint. For one class of injuries there is indeed a remedy which did not exist formerly—we mean the Divorce Court.

THE THEATRES.

NEW play by Mr. Tom Taylor, when he chooses to take the necessary trouble, is pretty certain to be successful. He has chosen an interesting period and has skilfully improved on history. The horror of Lord Clancarty, stanch Jacobite though he be, at the plot for assassinating King William III., and his warning to the King, are incidents which actually occurred, although Lord Clancarty was not the hero of them. He was married as a boy to a daughter of Lord Sunderland, parted from her at the church door, and never saw her again until he met her accidentally on coming to England as a Jacobite emissary. These facts are suitable for dramatic treatment. In the play the husband and wife, meeting as strangers, fall slightly in love with each other, and when Lady Clancarty learns that the handsome, gallant Captain Heseltine is her husband, she learns also that he is implicated in a conspiracy and liable to death. They meet only to part again immediately, and such an incident becomes, with good acting, powerfully affecting. It recalls, indeed, the pathetic lines in which another devoted follower of the Stuarts—the unfortunate Earl of Derwent-water—laments the cruel fate which sent him on his wedding-day to exile:—

The soldier from the war returns, And the merchant from the main, But I have parted from my love, And ne'er to meet again, my dear, And no'er to meet again.

The plot for seizing and carrying away, or in other words for murdering, King William was actually conducted by Sir George Barclay under a commission from King James authorizing him to do "acts of hostility" against the Prince of Orange. Barclay crossed the Channel in a privateer which landed him at a desolate spot in Romney Marsh. Here a contraband traffic in French wares was briskly carried on; but the smugglers had discovered that of all cargoes a cargo of traitors paid best. The lonely house called the Hurst became the resort of men of rank and consideration who lodged there while waiting for a passage to France. The Duke of Berwick, the ablest and most devoted of the adherents of his father King James, was among the guests at the Hurst. Barclay, having been long absent from England, was personally unknown to those who were to be joined with him in the plot. He was directed to walk in the evening in the Pianas of Covent Gardon with a handkerchief hanging from his pooket. It is difficult for us to realize such a state of things as having existed in England only two centuries ago. Treason and running cargoes have become equally obsolete, and the Sovereign neither dwells at Kensington nor hunts in Richmond Park. In the time of King William III, there was no bridge over the Thames between London and Kingston, and the King used to go in his ceach, escorted by his Guards, through Turnham Green to the river, where he crossed, and found another coach and set of Guards waiting for him on the Surrey side. The return was made by the same route, and it was on the return that the Guards were to be attacked and overpowered, while Barclay, with eight trusty men, was to "levy war" immediately on the King's person. Meanwhile Berwick was in England, endeavouring to carry out a plan more suitable to interest character of one of the first soldient of that age. Men of rank and fortune assured them that they would have their swords for their rightful King as soon as a Fasuch energy landed, and Berwick assured them that a French

This is the state of things which Mr. Tom Taylor incompented in his play. The part which was really performed by a gentleman manual Presidence has been assigned by him to Lord Chancarty. This addisons attempts to save the King without harming the conspirators. He goes to Kensington Pales, obtains an interview with the King, and warm him. The King perceives that the admires the General while rejecting the King. To the King's remark, "I never saw you before," he answers, "Neither I nor anybody else ever saw you before," he answers, "Neither I nor anybody else ever saw you before," he answers, "Neither I nor anybody else ever saw you before," he answers, "Neither I nor anybody else ever saw you before," he answers, "Neither I nor anybody else ever saw you before," he answers, "Neither I nor anybody else ever saw you before," he answers, "Neither I nor anybody else ever saw you before," he answers, "Neither I nor anybody else ever saw you before," he has they inight, could enter without respect the presence of "the anthmatic skeleton who covered the slow retured of King Aillian spoke English badly, and knew little, and cared less, about English seets and parties. But on two points he and his new subjects were always fully agreed. He and they loved racing well, and fighting better, and on the course at Newmarket, and in the trenches at Namur, he and they thoroughly sajoyed the sport. Hence the interview of King William and Lord Chancarty is true to nature and history, and with good writing and careful acting—and nothing can be better than Mr. Henry Neville's Chancarty—furnishes an effective scene. The success of Mr. Tom Taylor does not prove that an inferior artist might not have falled, but still it may at least be said that the materials for ancessful plays exist abundantly in English history, and the splendid accessories which modern taste demands cannot be better employed than in ornamenting a Court. The ladice-in-waiting on Princess Anno may wear any quantity of fine dresses without suggesting the remark that t

acting—and they are well acted—atrongly interesting, and the play is likely to bring prosperity to the Olympic Theatre. It is to be hoped that Mr. Tom Taylor will dig deeper into the same mine. If there has been of late years little talent devoted to dramatic writing, there has been less industry.

In striking contrast with this drama of the past is a drama of the immediate present, which has been produced at the Court Theatre. The character of Roaring Dick is as true to human nature in the mineteenth century as that of Lord Clancarty in the seventeenth. Indeed the same qualities which loved the chances and braved the perils of Jacobite conspiracy now exhibit themselves less nobly in the gambling and brawling of gold-mining in California. As there is no American land west of San Francisco, it is perhaps difficult to say where these qualities will find their next appropriate field, and it must be owned that if fighting in taverns be a necessary "institution" of a new country, the usages of the seventeenth century were preferable to those of our own time. The novel called *Ready-Money Mortiboy* has been converted into an effective drama in which the parts of Rearing Dick and his associate Lafleur are well sustained. Like King William III. and Sunderland, each member of this partnership has qualities which the other lacks. Lafleur has patience and skill at all games of cards, but he lacks the nerve of Mortiboy. He believes in his system, but does not acruple to assist its working by cards inserted in his sleeve. Mortiboy, playing a friendly game with his former partner, discovers and exposes this fraud, and Lafleur in revenge draws a revolver and shoots him dead. Such an incident has occurred frequently in Californian taverns, and by a permissible license it is represented as occurring between two returned gold-miners in England. Perhaps the nearest antitype of Roaring Dick in the seventeenth century will be found in the buccancers of whom Scott has drawn so fine and faithful a picture in Rukeby. The friendship be

cisto of the Spanish main. Bertram
Thought on Darian's desert pale,
Where death leastides the evening gale.

He remembered that he had saved Mortham's life, and also that he had been driven from Mortham's house, and he shot Mortham in the press of battle on Marston Moor. Latieur shoots Dick in his own room. The speech of Dick Mortiboy at the children's feast, however shocking to the respected Vicar of the parish, was replate with practical associty. "Children," says he, "you've got to be discontented." Indeed, the fame, power, and position of England are due to her discontented children. It is to be feared that the teaching of the Church Catechism alone would neither have carried Drake round Cape Morn nor Livingstone to the great river Luslahs. We may indeed suppose that these leaders of explaration by see and land obeyed a divine impulse equally with the ploughmen and delivers who sleep in the churchyard of their own parish. It would be more to our knowledge there would be no adventures in

real life to supply materials for dramatic composition. The dangerous dectrines of Dick Mortiboy are, however, necessarily limited in their practical application. When a farmer asks him limited in their practical application. When a farmer asks him what could be done without labourers, he answers that not ten per cent. of the children to whom he spoke would have the pluck when they became men to emigrate. Ninety per cent. would remain to grow corn and weave cloth, not perhaps contented, but submissive. The select few of bolder spirits and more active bodies make our yovages of discovery, our wars our history and leafly the materials voyages of discovery, our wars, our history, and lastly the materials for our dramatic literature.

REVIEWS.

CURTIUS'S HISTORY OF GREECE .- VOL. V.

CURTIUS'S HISTORY OF GREECE.—VOL. V.*

MR. WARD has now translated Curtius's History as far as Curtius has written it himself—that is, down to what he calls "the Last Struggle for Independence." This means the struggle of Demosthenes against Philip. Let us begin by saying that the last chapter of this volume, the chapter which records this struggle, is, setting aside the geographical and other general chapters in which Curtius is all himself, incomparably the best part of the book. It is the best piece of narrative that he has written. Every one will remember that this part of the history is not Mr. Grote's strongest point. But the whole Macedonian time is Bishop Thirlwall's strongest point, and he and Curtius come here into natural competition. We wonder whether Curtius has read Thirlwall. His references to English works, save now and then to Grote, are of the very rarest, and form a marked contrast to Bishop Thirlwall's constant references to German works in days when Grote, are of the very rarest, and form a marked contrast to Bishop Thirlwall's constant references to German works in days when German was a tongue much less known in England than it is now. Anyhow, at this stage Thirlwall and Curtius are the two narratives to compare. In the earlier stages of the Philippic story, the Amphipolitan, Olynthian, and Phokian stages, Ourtius's marrative seemed to us, not perhaps positively heavy and feeble, but heavy and feeble compared with the narrative of the Bishop. In the last stage of all it is no longer so. In the story of Amphissa and Chairôneia the English writer does not fall below his former level, except so far as he is at any time more at home in describing a negotiation than a battle; but the German writer level, except so far as he is at any time more at home in describing a negotiation than a battle; but the German writer decidedly rises above his. In this part of his work Curtius shows a life, vigour, and power which is quite new to him, and he carries us on with him in a way in which we do not remember his doing so in any other strictly narrative part of his work. He and Bishop Thirlwall agree in doing justice to the Athenian side, and yet not doing injustice to the Macedonian side; this Mr. Grote was too exclusively and devotedly Athenian to do. Never has Demosthenes been more worthily dealt with than he is here dealt with by Curtius, nor have the position and designs of Philip ever been better set forth. Curtius thoroughly understands both Philip's position with regard to Greece generally and his special position with regard to Athens, and this Mr. Grote did not, because he could not. Mr. Grote could Greece generally and his special position with regard to Athens, and this Mr. Grote did not, because he could not. Mr. Grote could not fully understand Philip's position, for the same reason that Demosthenes could not understand it; Thirlwall and Curtius, while yielding not one jot to Grote in admiration for Athens and Demosthenes, can see the other side of the case too. They can see that, though Philip put an end to the greatness and independence of the Athenian democracy, yet still he was not a mere barbarian destroyer—that his position with regard to Greece is something very different from the position of Parius and Xerxes. The scheme of Darius and Xerxes was to make Greece a satrapy of a barbarian kingdom. The scheme of Philip was to transfer to himself, as the King of a Greek State, the same kind of supremacy which had in earlier times been held or claimed by the great cities of Greece in carlier times been hold or claimed by the great cities of Greece in turn, by Argos, Sparta, Athens, and Thebes. Philip would make himself, like Agamemnon, the Bretwalds of Hellas, and would, in numself, like Agamemnon, the Bretwalde of Hellas, and would, in that character, go forth against the barburians of the East. The practical differences between such a supremacy as this when held by a Greek city and when held by a Macedonian King are plain upon the surface. To go no further, in the hands of the Macedonian King it was sure to be far more steady and lasting. The position itself, however, is one which Grote does not understand, but which Thirlwall and Curtius do.

But when we find Curtius so well understanding the state of things at the time when he leaves off, it makes us only the more wonder why he should have left off at that time. In the general history of the world, as distinguished from the political general history of the world, as distinguished from the political history of Athens, the Macedonian supremacy in Greece-is not an end but a beginning. It is the beginning of a new life, of a new dominion on the part of the Greek mind. When Philip overthrew Athens and Thebes at Chaironeis, it was as little the end of Greek history as it was the end of Roman history when Alaric entered the Salarian gate. In both cases what seemed to be the ending of the old life was only the beginning of the new. No History of Greece which has yet been written has even tried to show the connexion of Greeian history with universal history at this end. But Curtius, if he really stops where he stops as yet, is further from doing it than anybedy else. It shows strange blindness in a political History of Greece as distinguished from a political History of Athens only, wholly to leave out the Federal period, the tale of

* The Ristory of Greece. By Professor Dr. Ernst Curtius. Translated by Adolphus William Ward, M.A. Vol. V. London: Richard Bentley & Son. 1873

which Bishop Thiriwall has told with great clearness, and which since he wrote, has not lacked expounders either in Germany or in England. Mr. Grote's contempt for the Greece of Polybios is if not justifiable, at least intelligible; in Curtius we do not anderstand it. But Ourtius winds up even some than Mr. Grote, for while Curtius stops at Chaironeis, Mr. Grote does go on to Dêmêtrios Poliorkétés. In so doing Mr. Grote, if he does not record the last struggles of Greece for independence, does at least record the last struggles of Athens for independence. But even setting aside Achaian revival, we cannot understand how Curtius can call the war of Chaironeia the last struggle for Greek independence, when there are still before him the driving out of the Macedonians from Thebes, the war of Agis, and the Lamian war. Macedonians from Thebes, the war of Agis, and the Lamian war. It is especially strange in Curtius, who is so careful to connect his It is especially strange in Curtius, who is so careful to connect his subject with general history at the other end, that he should wind up his work, if he really means to do so, at a point which makes a natural ending for a chapter or a volume, but which certainly makes no ending at all for the whole history. Curtius is, beyond everybody else, the historian not so much of Greek politics and warfare, as of Greek art, Greek culture, and Greek life generally. It is strange that he of all men should stop at a time when, if Greek political feeling received a deadly blow, general Greek culture received a new start, and began the conquest of a new and almost boundless dominion. We have said over and over again that in dealing with the internal politics of Athens Curtius is not happy; but we have also said politics of Athens Curtius is not happy; but we have also eaid over and over again that in his pictures of general Athenian culture and life he is eminently happy. We should have liked to have and life he is eminently happy. We should have liked to have more sketches of the same kind from his hand. He fails in his conception of the city democracy of Athens; if he went on further, we suspect that he would fail in his conception of the Federal democracy of Achaia; but we can conceive no man more highly qualified to give us a picture of Antioch and Alexandria in the days of their glory, and to compare the art and intellect of Hellas in its native home by the Ilissos with the same art and intellect when

transplanted to the banks of the Orontes and the Nile.
